Cork R.D.C. (April 10th and 12th. Mr. C. H. Deane).—£120,000 for a scheme of improvements, including the erection of a large number of workmen's cottages.—The inspector was engaged for a considerable part of the time in hearing evidence for and against the eligibility of applicants for the occupancy of cottages.

Croydon T.C. (April 21st. Mr. G. L. Pepler).—This was an inquiry into an application for permission to prepare a town planning scheme in reference to the area in the northern part of the borough known as the Beulah-hill district, about 800 acres in extent.—Mr. H. Conacher, barrister, appeared for the Ecclesiastical Commissioners, who own about 150 acres of the land. He said they did not wish to be included in the scheme, as they were already putting into operation a town planning scheme, and were willing to meet the corporation in any way.

Newmill U.D.C. (March 25th. Mr. F. O. Stanford).—£5,200 for works of water supply, including the construction of a reservoir of 1,500,000 gallons capacity at Hade Edge.—The surveyor, Mr. F. Boothroyd, stated that the present supply was derived from the Magnum drift, the Gooseholes drift, and Bankhouse, the storage accommodation comprising a small tank at Gooseholes and a small reserve at Bankhouse. Scarcity arose in 1912-13.

Nottingham T.C. (April 21st. Mr. Raymond Unwin).—This was an inquiry into an application for authority to prepare a scheme of town planning for some 600 acres of land lying between Mansfield-road and Nottingham-road.—The town clerk (Mr. W. J. Board) said the land was undeveloped, save for a hosiery factory and a few cottages, which would not interfere with the scheme. It was proposed to have a main arterial road, probably 80 ft. wide, running along the Day Brook, and a 60-ft. road along the bridle path to the south of the prison. Land would be reserved for a recreation ground or grounds and other public purposes, and Edward's-lane, part of Hucknall-road, and part of Nottingham-road would be widened. With the exception of the railway companies, no objection had been raised by the owners of the land.

APPLICATIONS FOR LOANS.

Audley U.D.C.—£1,200 for works of sewerage.

Lowestoft T.C.—£3,000 for works of drainage.

Pembroke T.C. £1,000 for the purpose of drainage works.

Prestwich U.D.C. £325 in connection with the town planning scheme.

Warwick T.C.—£700 for works of water supply.

Worcester T.C.—£1,967 for works of sewerage.

LOANS SANCTIONED.

Hendon U.D.C. £27,750 for main [illegible] works.

Okehampton T.C.—£106 for works of water supply to East street.

Walsall T.C. £16,700 in connection with the electricity undertaking.

FORTHCOMING INQUIRIES.

APRIL.

		£
27.	**Budleigh Salterton.** For works of water supply (Mr. W. O. E. Meade-King) ...	700
27.	**Torrington.** For the [illegible] (Mr. H. A. Chapman)	450
28.	**Bradfield.** For works of water supply (Mr. R. H. Bicknell)	900
	TOWN PLANNING.	
29.	**Little Hulton.** (Mr. Raymond Unwin)	

The L.C.C. and Heavy Motor Traffic.—A movement [illegible] a conference of road authorities with a view to definite action being taken to mitigate the nuisance caused by the vibration of heavy motor cars and road locomotives.

Municipal Work in Progress and Projected.

The Editor invites the co-operation of Surveyor readers with a view to making information given under this head as complete and accurate as possible.

The following are among the more important projected works of which particulars appear below: Buildings, Bristol; [illegible], Middlesbrough; housing and town planning, Cardiff; Saltcoats; roads and materials, Harrogate, Norfolk, Swansea and Neath; sewerage and sewage disposal, Essex, Rochford; water supply, Derby, Penrith; and other municipal works will be found on our "Local Government Board Inquiries" page.

ADMINISTRATION.

Swansea T.C.—The council have approved in principle proposals made by the Borough Surveyor, Mr. J. R. Hosier, for the reorganisation of the Highways Department, the object of the scheme being to [illegible] two men with the Colours, and the appointment of a junior and a boy clerk.

BUILDINGS.

Abergavenny T.C.—A covered shelter is to be built [illegible] at a cost of £180.

Banff C.C.—A report on the reconstruction of the Northern Bridge, at an estimated cost of £1,451, [illegible] has been submitted to the Road Department [illegible] committee for consideration.

Bristol T.C.—The Local Government Board have intimated their approval of the plans for the enlargement of the hospital at Nover's Hill.

Esher and the Dittons U.D.C.—The tender of Messrs. Dorman, Long & Co., at £1,105, has been accepted for the supply and erection of steel girders for the Hare-lane Bridge. The workmen are to receive [illegible] 2s. 6d. per week [illegible] to accept additional employment and [illegible] each.

Hampton U.D.C.—The question of the proposed open-air swimming bath is to be deferred, owing to the increased cost of materials and the lack of skilled labour.

Ilford U.D.C.—The surveyor, Mr. H. Shaw, has prepared a sketch [illegible] a proposed [illegible] Farm.

Maldens and Coombe U.D.C.—The council are to contribute half the cost, estimated at £80, of the reconstruction of the bridge over the Beverley Brook at Burlington-road. The Local Government Board have declined to sanction the proposed grant by the council of £25 to the Malden Athletes' Volunteer Corps for a rifle range, stating their view that the expenses of voluntary bodies should be met by voluntary subscriptions rather than from public funds.

Middlesbrough T.C.—The design of Mr. J. Forbes, of Middlesbrough, has been selected for the proposed new William Fallowes School at Grove Hill.

HOUSING AND TOWN PLANNING.

Arklow U.D.C.—The council have taken up a loan of £1,100 for working-class cottages.

Atherstone R.D.C.—It has been decided to submit to the Local Government Board a scheme for providing additional housing accommodation.

Baldock U.D.C.—The surveyor, Mr. P. Kent, has prepared plans for two houses.

Bangor T.C.—It has been resolved to build twenty-four working-class houses on the Sackville-road site.

Cardiff T.C.—A deputation that interviewed the Public Works Committee on the subject were informed that the borough engineer, Mr. W. Harpur, had the subject of town planning in hand, and that if the war had not intervened the council would probably have embarked on a scheme before now. A subcommittee was appointed to go into the matter and report.

Chesterfield T.C.—The borough surveyor, Mr. Vincent Smith, has received instructions to prepare a housing scheme, the houses to be let at from 5s. to 5s. 6d. per week.

Coleraine R.D.C.—The clerk on Saturday reported that the council's new scheme for the erection of additional labourers' cottages was now complete. The total amount of the loan, he said, was £9,636. A memorial asking the Local Government Board's [illegible] to the scheme [illegible].

Downham U.D.C.—A communication has been received from the Local Government Board asking for the details as to the increased price of building materials, and stating that they saw no reason why the council should not prepare a housing scheme to [illegible] to the Local Government Board for their approval. The council agreed to refer the matter to the Housing Committee.

Enniskillen U.D.C.—A proposition has been carried to build thirty-two workmen's houses.

Menai Bridge U.D.C.—On the recommendation of the General Purposes Committee, the council have resolved to apply to the Local Government Board for its consent to the appropriation of 195 sq. yds. of land at New-street, under the Act of 1890, for the purposes of workmen's cottages.

Scarborough T.C.—It has been decided to proceed with housing schemes in the east and central wards [illegible].

PARKS AND OPEN SPACES.

Govan T.C.—It has been agreed to purchase a site [illegible] as a new open space.

REFUSE COLLECTION AND DISPOSAL.

Consett U.D.C.—The surveyor, Mr. F. Hargreaves, has submitted a report advising against the use of motors for refuse removal under existing conditions, because of the continuous short stops, while there was no convenient centre to which refuse could be carted for loading on to the motor without creating a nuisance. With respect to the possibility of improving the middens, and thus getting rid of the drawback of having to remove wet refuse, he suggested that the council should exercise their powers under the Public Health Amendment Act, 1907, and assist the owners half-way by, say, laying the drain and contributing £1 per midden altered. If by this means they got the 100 middens which are collecting the most subsoil altered quickly, they would, in a very short time, save the expenditure in reduced working costs. If, however, the council decided generally to adopt the dry refuse system, he was of opinion that, viewed entirely as a business proposition, it would pay the council well, as to effect a saving of over £200 per annum it would only take an expenditure of £1,700. He believed it would then be possible to reduce the cost of house refuse removal further, as the use of motor haulage would become practicable.

Plymouth T.C.—The council have confirmed the minute of the Works Committee to make a charge of 2s. 6d. per load for collecting and removing trade refuse.

Ramsbottom U.D.C.—In a report with respect to the refuse destructor, brought into use a little over a year ago, it is stated that the actual cost per ton of refuse destroyed was 1s. 5½d. The sinking fund and interest charges work out at 2s. 5d., making a total of 3s. 10½d. per ton.

ROADS AND MATERIALS.

Cork T.C.—The Road Board, in a communication, state that as the proposed improvements on the Lower Glanmire-road and Western-road are of a most urgent and pressing character, application will be made to the Treasury for their approval to the proposed advance of £1,000 towards the work, and when this is received the grant will be forwarded.

Cornwall C.C.—With respect to applications for grants for works of road improvement, the county surveyor reported that the secretary to the Road Board had written that the board proposed to make grants towards the cost of road crust improvements which were immediately required, but that unless special circumstances could be shown such grants would be on a considerably reduced scale, and would only be made in the case of important roads. Later, Mr. Maybury, manager and engineer to the Road Board, informed him (the surveyor) that the Treasury had been disinclined to allow them to make any grants at all, but the board had induced them

to relax to a certain extent, and he thought they might be able to offer £3,500 to Cornwall, and would leave the selection of works to the Main Roads Committee. He (Mr. Maybury) was not prepared to recommend any grant towards tar-spraying, excepting where there were very special reasons for doing such work. The total of grants for 1914-15 was £13,039, including £2,128 for tar-spraying.—The council agreed that unless the Road Board made a grant towards tar-spraying the county occupied the same position as the Road Board, and would not make any contribution out of the county funds. The council have sanctioned a scheme for the repair of the road from Penzance to St. Just, at an estimated cost of £1,500.

Croydon T.C.—An improvement is to be carried out in Cherry Orchard-road, with the object, among others, of removing the dangerous corner at Hall & Co.'s Wharf, and making the thoroughfare 50 ft. wide.

Derry C.C. The council on Saturday decided to provide motor cycles for their assistant surveyors, the county surveyor to get estimates of the cost. The council also voted a sum of £20 per annum to each surveyor towards the maintenance and upkeep of the machines, provided they satisfied the county surveyor that they had expended at least that sum on running and maintenance.

East Grinstead R.D.C. The council have accepted the following tenders for the hire of horse and man to work the water cart with the steam roller:—Forest Row parish, Mr. G. Williams, 6s. per day; Hartfield parish, north of railway, Mr. S. J. Cole, 6s. per day; Withyham, north of railway, Mr. S. J. Cole, 6s. per day; Worth, Mr. T. Worsell, 5s. 6d. per day; West Hoathly, Mr. Geo. Williams, 6s. per day.

Halesworth U.D.C. With a view to reducing the cost of street watering, it has been decided to surface-tar all streets hitherto watered.

Hayes U.D.C.—The surveyor, Mr. D. C. Fidler, has prepared a plan and estimate for the widening and repair of Yeading-lane.

Hendon U.D.C. Plans and estimates have been completed for the widening of Finchley-lane, at an estimated cost of £4,019. Private street improvements, estimated to cost £19,042, are also under consideration.

Keynsham R.D.C. The county council have authorised the surface tarring of a total length of 3,710 yds., containing an area of 23,692 sq. yds. of the main roads, at the rate of 1·75d. per super. yard. The county council have also authorised the surface tarring of the Bath and Bristol road for a length of 11,964 yds., containing an area of 40,452 sq. yds. The highway surveyor, Mr. J. Johnson, said he had been requested by the county surveyor to prepare a statement of the additional cost incurred in maintaining the London, Bath and Bristol road, owing to military traffic. The county surveyor and he both agreed that no damage of a serious nature had been done to that road, and the extra cost, amounting to £149, was for surface damage only. Undoubtedly considerable damage would have been done had not careful attention been paid to the work of strengthening weak sections of the road with good, sound material during recent years, and that undoubtedly accounted for the road standing so well. The council, he added, would be interested to know that theirs was the only district in which Road Board work would be carried on this year.

Norfolk C.C. The council have approved of a number of schemes prepared by the county surveyor, Mr. T. H. B. Heslop, and have agreed to make application to the Road Board for a grant, and that if such grant be given the work be proceeded with, provided the Road Board are willing to grant the amount, which is estimated at £9,000. In the event of their only agreeing to make a smaller grant the scheme is subject to reduction accordingly. Part I. To convert existing granite surfaces to surfaces of bituminous or similar materials. Total cost, £2,844. Part II.—To convert existing gravel surfaces to granite surfaces and tar-paint. Total cost, £12,695. Grand total of scheme, £15,539. Amount expected to be received from Road Board, £9,000. Retarring of work carried out under former grants.—Second tarring of work under gift scheme, £1,513; amount expected to be received from Road Board, £756. It has also been decided to carry out tar-painting works, at an estimated cost of £6,392.

St. Austell R.D.C.—It has been agreed to supply to the county council 3,000 tons of stone from the council's quarries at 7s. per ton, and chippings at the same price. For ballast the council quoted at 5s. per cubic yard.

Norwich T.C.—It has been agreed to purchase a strip of land at the junction of Earlham-road and Mill Hill-road for the purpose of a street improvement scheme.

Somerset C.C. — At the meeting of the council recently attention was again drawn to the dangers arising from the slipperiness of the tarred roads, and it was urged that the interests of horse owners should be considered as well as those of motorists. It was suggested that the difficulty might be met by leaving an ordinary track either in the middle or at one side of the road for horses. The chairman said that no doubt the suggestions made would be considered by the county surveyor.

Stirling T.C.—It has been resolved to carry out several schemes of road repair to meet military requirements.

Weston-super-Mare U.D.C. — The surveyor, Mr. H. A. Brown, has received instructions to proceed continuously with the work of reconstructing the roads during the summer months.

SEWERAGE AND SEWAGE DISPOSAL.

Essex C.C.—The Public Health Committee submitted recently a report that they considered a proper sewerage system for Bocking of serious importance, and they were giving further consideration as to the steps to be taken.

Farnborough U.D.C.—Bacteria beds are to be installed at the sewage disposal works, at an estimated cost of £100.

Heywood T.C.—The council have under consideration a sanitary conversion scheme which is estimated to cost £5,020.

Hull T.C.—The town council have adopted the recommendation of the Health Committee that, where the owners of property failed to comply with notices served upon them to provide water-closets, and the corporation executed the work, the closets and fittings be purchased direct from the makers and supplied for fixing by contractors.

Kidderminster T.C.—The Local Government Board have intimated their approval of the scheme for sewering the new areas in the extended borough of Kidderminster, and for the new work on the sewage farm, which has been the subject of much discussion at Kidderminster, Stourport, and Bewdley. The approval is subject to certain minor amendments. The amount of money necessary to carry out the scheme is about £31,000, and the Local Government Board intimate that sanction for the loan cannot be given at present owing to the war.

Naas No. 1 R.D.C.—The tender of Messrs. Fleming Brothers at £632 has been accepted for sewerage works at Sallins.

Richmond T.C.—The council have decided on the construction, at an estimated cost of £3,925, of a total length of 843 yds. of heavy cast-iron sewer pipes of 12-in. diameter to remedy difficulties with the sewers in River-lane, Petersham, and along the towpath. The borough surveyor, Mr. J. H. Brierley, will duly issue advertisements for tenders.

Upton R.D.C.—Schemes of sewerage for Madresfield and Guarlford have been approved, but the work will not be put in hand until normal times.

WATER, GAS, AND ELECTRICITY.

Banff C.C.—The Banff District Committee have accepted the tender of Messrs. Clark & Chapman, of Aberdeen, at £1,993, for the works in connection with the additional water supply for Findochty. For the Whitemills water supply the tender of Mr. J. Watson, Banff, at £2,197, has been accepted.

Berwickshire C.C.—The Middle District Committee intimate that they have obtained sanction to the borrowing of £500 on account of the Greenlaw water scheme.

Boston T.C.—The council have received a communication from the Local Government Board on the subject of the inquiry held by their inspector at Boston in November, with reference to the quality of the local water supply. The board said they were advised that the water company's works were in several re-

spects in need of attention, and were urging upon the company that efforts should at once be made to secure these general improvements, and if it had not already been done the old reservoir should be cleaned out as soon as possible, care being taken not to endanger the supply of water.

Derry T.C.—A report on a proposed new water supply has been prepared by Mr. M. A. Robinson, M.INST.C.E., city surveyor. Mr. Robinson recommends the adoption of a scheme for bringing water from Banagher Glen. The glen lies on the south-eastern side of the road from Feeny to Dungiven, 2½ miles distant from Feeny and 3¼ miles from Dungiven, and is the junction of the Glendra, Altnaheglish, and Finglen rivers, which here unite to form the Owenrigh, a tributary of the River Roe. On the 6,000 acres proposed to be utilised at the outset there are only 174 acres of arable and grass land, and of this only 100 acres are under cultivation; the remaining 5,826 acres are all mountain upland. Professor Leebody reports most favourably regarding the quality of the water, and Mr. J. R. Kilroe, late of the Geological Survey Staff, describes the geological conditions as most satisfactory. The proposal of the city surveyor is that the present reservoirs should be utilised, the existing supply entering them being sent down the by-wash. His estimate of the cost is £209,000, which will include filtration and the provision of an aqueduct across the Foyle.

Holywood (Ireland) U.D.C.—The Local Government Board have consented to increase the loan for the water supply scheme, including the repair of the embankment of the new reservoir, to £5,700, payable to be spread over a period of [illegible].

Manchester T.C.—The Gas Committee have not yet arrived at any decision as to their future policy, except to adhere to their intention of raising the price of gas 6d. per 1,000 ft. The Electricity Committee, it is stated, intend to revise the charges, and have agreed to contribute £30,000 towards the city rates.

Morecambe T.C.—Considerable progress has been made in the electric light department, and the council this year will be able to redeem their promise to the Local Government Board to reduce the deficit to £2,000 each year.

Newton Abbot R.D.C.—While approving generally of the scheme for works of water supply at Bovey Tracey, the Local Government Board have written stating that they could not sanction the necessary loan at the present time.

Northampton T.C.—It has been decided by the Highways Committee to effect certain economies in street lighting. A number of lamps in the side streets are not to be lighted, but lamps at street entrances are to be lighted. The lighting of the 117 large high-power lamps is to be reduced by the substitution of small burners, and the painted screen on the top of these lamps is to be removed.

St. Pancras B.C.—Since the war the cost of carbons and arc-lamp globes has increased considerably, and at the municipal electricity works experiments have been made in connection with the substitution of half-watt lamps for carbon-burning lamps. For some months an experimental circuit of fourteen half-watt lamps has been in operation in Gower-street and has proved exceedingly successful. These lamps have burned for nearly 3,500 hours without a breakage, although they were only guaranteed for 800 hours. They were procured from Germany, but a source of supply is now obtainable from Holland. In view of the success of the experiment half-watt lamps are to be substituted generally for the open type of arc lamps.

MISCELLANEOUS.

Aberdeen T.C.—The council have voted Mrs. Dyack, widow of the late burgh surveyor, Mr. William Dyack, a gratuity of £400.

Conway T.C.—The borough surveyor, Mr. F. A. Delamotte, reported that the mussel purification tanks, which have been constructed at a cost of about £2,000, are now completed, and that he was awaiting the visit of the experts of the Board of Agriculture and Fisheries to carry out their experiments in bulk, to show that the process which mussels taken from the estuary will pass through before being sent to the market will effectively cleanse them.

Esher and the Dittons U.D.C.—Mr. Edgar Dudley, an inspector of the Local Government Board, has selected twenty-five of the council's workmen for recommendation by the board to the War Office in connection with the manufacture of munitions.

Flintshire C.C.—Mr. A. E. Carey, engineer, has submitted two schemes for dealing with erosion. Under the first he proposes (*a*) the construction of two groynes 180 ft. long, (*b*) planking for a distance of 100 yds., (*c*) 60 lin. ft. of universal joint steel piling 12 ft. long. The estimated cost of this scheme is £1,800. The second scheme is more comprehensive in character, and is designed to provide a permanent equilibrium of coast conditions. It consists of (*a*) eleven groynes as in (*a*) of first scheme; (*b*) to pitch the eroded front immediately to the east of the Rhyl boundary with breakers of Penmaenmawr stone bedded in Portland cement grout, for a length of 140 yds.; (*c*) at the eastern end of the protective stone-work as described in (*b*) to sheet pile in timber for a distance of 1,200 yds.; (*d*) on the inner side of the piling mentioned in (*c*) to drive similar piling; (*e*) the space between the pilings would be filled with sand, and on the top of the sand formation would be laid a reinforced concrete mattress, and above such mattress road surfacing; (*f*) to build a parapet of Penmaenmawr stone on the sea side. The estimated cost of this scheme is £15,750.

Hampton U.D.C.—The workmen, except those at the sewage works, are to receive 2s. per week extra during the war. In the case of those excepted there has been a re-arrangement of working hours.—The contract price of horse hire has been increased from 9s. to 10s. per day, in consideration of the increased cost of forage.—The names of nineteen employees have been furnished in response to the Local Government Board's circular of March 11th suggesting that local authorities should release their workmen for employment in armament work.

Maldens and Coombe U.D.C.—In response to the inquiry from the Local Government Board as to releasing men for the manufacture of munitions of war, the Finance and Establishment Committee have reported that they did not consider the matter applicable to this district. Apparently this is not the view of the Local Government Board, whose inspector has nevertheless selected twelve men for possible use.—All workmen, with the exception of unmarried men eligible for military service, in receipt of 30s. a week and under, are to be paid an additional 2s. per week during the continuance and for six months after the end of the war.

Surbiton U.D.C.—From a complete list of the names of men employed by the council, Mr. Dudley, of the Local Government Board, has selected eighteen who might be utilised in the manufacture of munitions of war.

Institution of Civil Engineers.—The annual general meeting of corporate members, to receive the report of the council, and to elect the council and auditors for the ensuing year, will be held on Tuesday next at 8 p.m. On its conclusion a special general meeting of corporate members to consider and, if approved, to adopt a proposal for the amendment of the by-laws will take place.

Motor Organisations and Private Legislation.—In accordance with their usual practice, the Royal Automobile Club and the Automobile Association and Motor Union carefully considered all Private Bills introduced into Parliament in the last Session, and it was ascertained that in a number of instances the promoters were seeking powers which, if granted, would be opposed to the interests of motorists. In several Bills power was sought to make water used for washing motor cars a non-domestic supply, which would have meant that the water companies could have refused to supply water for this purpose except on their own terms. In some cases the opposition has resulted in Bills which are being amended to meet the objections raised, while in others which are pending representations have been made to the Local Government Board as to the unsatisfactory nature of the particular proposals. Among the other Bills which have received attention are various tramway Bills in which municipal authorities have sought power to erect tramway equipments, and these proposals have been carefully investigated with a view to avoiding unnecessary obstruction on the highway by central standards, and so forth. Mention should also be made of the Blyth Corporation Bill, in which it was proposed to charge certain tolls which appeared to be of an unreasonable character. This Bill has consequently been opposed

PERSONAL.

Mr. John Alcorn, burgh surveyor and water engineer of Oban, died last week, we regret to state.

Mr. R. Blanchard, surveyor to the Cannock Urban District Council, has received an increase of salary.

Mr. A. Skinner, of the Beverley surveyor's department, has been appointed second assistant at Batley.

Mr. F. E. Wentworth-Sheilds, M.INST.C.E., at a meeting of the Concrete Institute last night, read a paper on "The Stability of Quay Walls on Earth Foundations."

Mr. Sidney F. Evershed, of the borough engineer's office, Daventry, has been appointed chief engineering assistant to Mr. John W. Harris, engineer and surveyor to the Wantage Rural District Council.

Mr. T. Lynam, surveyor to the Cudworth Urban District Council, has been congratulated by his council upon having recently passed the examination for associate-membership of the Institution of Civil Engineers.

Mr. S. Duxbury, manager of the sewage disposal works of the Maldens and Coombe Urban District Council, has been granted an increased salary of £20 per annum from April 1st, with two further annual increments of £10.

Messrs. J. C. Hennah and C. E. Sims, members of the Ham Urban District Council, have been appointed, with the surveyor, Mr. R. W. Hindhaugh, delegates to the conference shortly to be held by the National Housing and Town Planning Council.

Mr. H. A. Scott, assistant surveyor to the Maldens and Coombe Urban District Council, has, it was reported on Tuesday, been given permission to join the Army, and his position will be kept open for him, the council meanwhile paying him the difference between his salary and his Army pay.

Mr. C. J. Jenkin, engineer and surveyor to the Finchley Urban District Council, has just started for Serbia under the Serbian Relief Fund and Red Cross, to give assistance in connection with sanitary matters. He is doing so at considerable financial sacrifice, and has been given six months' leave of absence.

Mr. R. H. Jeffes, surveyor to the Maldens and Coombe Urban District Council, has been granted an increase of salary by two annual increments of £25 as from April 1st, in recognition of the extraordinary professional work carried out by him in connection with the extension of the sewage disposal works, of his acting as sanitary inspector *pro tem.*, and for undertaking additional duties in respect of the municipal allotments.

Mr. James Snook, highways superintendent and sewage farm manager to the Wimbledon Corporation—whose death we recorded in our last issue—was buried at Wimbledon cemetery on Thursday of last week, the Rev. Father Rankin delivering a short address at the graveside. At the meeting of the town council on Monday it was moved that the sincere regret of the council be conveyed to Mrs. Snook and family, and the motion was adopted in silence. The deceased left some fifty-three descendants.

Mr. C. F. Gettings, county surveyor of Worcestershire, has been elected a member of the Institution of Civil Engineers, and the following have been elected associate-members of the same body—namely, Messrs. E. A. Black, engineer's department, County Hall, Kingston-on-Thames; W. H. Eley, engineer and surveyor to the Newmarket Urban District Council; C. A. Gill, city engineer's office, Peterborough; J. R. Hadfield, surveyor's office, Berkhamsted; P. E. Harvey, borough engineer's office, Worthing; W. T. Lynam, engineer and surveyor to the Cudworth, Yorks, Urban District Council; R. C. Moon, municipal offices, Nuneaton; L. J. Small, council offices, Woodford Green; S. Walker, sewers and rivers department, city engineer's department, Birmingham; and C. Walmesley, Grizedale Lea reservoir, Barnacre, Garstang. Messrs. F. J. Manning, town hall, Luton, L. J. Rogers, council offices, Wellingborough, and J. A. Searle, municipal offices, Grimsby, have been admitted as students of the institution.

At the annual meeting of the Sheffield Society of Architects and Surveyors, held on the 15th inst., officers for the ensuing year were elected as follows: President, Mr. A. F. Watson; vice-president, Mr. C. B. Flockton; treasurer, Mr. R. W. Fowler; hon. secretary, Mr. James R. Wigfull; committee, Messrs. W. G. Buck, F. E. P. Edwards, J. R. Hall, H. I. Potter, H. L. Paterson, C. S. Sandford, C. F. Innocent, J. Lancashire, and F. H. Wrench.

The Scottish Housing Commission.—Mr. McKinnon Wood stated in the House of Commons on Tuesday, in reply to a question, that it was not yet possible to say when the Royal Commission on Housing (Scotland) would report. He understood that their inquiries covered a wide range, and that it had not yet been possible to obtain the evidence of several important witnesses, owing to circumstances connected with the war.

FOR OTHER ADVERTISEMENTS
See End of Paper.

BOROUGH OF RICHMOND (SURREY).
TO CONTRACTORS.

The Richmond (Surrey) Town Council are prepared to receive Tenders for the laying only of about 850 yards lineal of 12-in. Cast-iron Pipe Sewer, together with the construction of all necessary Manholes, along River-lane and the Towing Path, Petersham.

Drawings and Conditions of Contract may be seen, and all particulars obtained, on application to Mr. J. H. Brierley, Borough Surveyor, Town Hall, Richmond, Surrey, where a Form of Tender, together with a copy of the Specification and Bill of Quantities, may be obtained on payment of a deposit of One Guinea, which will be returned on receipt of a *bonâ-fide* Tender.

No Tender will be considered unless it is properly filled up, nor unless the Bill of Quantities and Schedule of Prices have been properly priced throughout.

Sealed Tenders, properly endorsed, must be delivered to me at the Town Hall, Richmond, Surrey, not later than noon on Wednesday, the 5th May, 1915.

The Council do not bind themselves to accept the lowest or any Tender.

HENRY SAGAR,
Town Clerk.

Town Hall,
Richmond, Surrey.
April 19, 1915. (2,551)

BROMSGROVE URBAN DISTRICT COUNCIL.

Tenders are invited for the supply of about 500 tons of 2½-in. Machine-broken Granite, and about 400 tons of unbroken Granite (for metalling roads), delivered free at Bromsgrove Station, at such times and in such quantities as required. Tenders for both, and small samples of broken Granite, to be sent to me not later than 5th May, 1915.

The Council does not bind itself to accept the lowest or any Tender.

FRANCIS J. RUSSON,
Clerk.

New-road, Bromsgrove. (2,548)

DISTRICT ENGINEER required for the Public Works Department, British Guiana. Three years' agreement, with possible extension. Age, 23—40. Salary, £300—£20—£400. Free first-class passages out and home. Candidates should have a practical and theoretical training in Civil Engineering, and Membership in the Institute of Civil Engineers is desirable, but not compulsory. Those candidates having had considerable Municipal experience under a first-class English Corporation will be most favourably considered in connection with the foregoing requirements. Apply at once, by letter, to the Crown Agents for the Colonies, Whitehall-gardens, London, S.W. (2,549)

ROADSTONE GRANITE QUARRY.—The Proprietors of a well-equipped Quarry, capable of a large output, desire to meet with a Quarry Manager who would undertake the production of Road Metal at an agreed price per ton free on board steamer alongside Quarry. The Quarry is well developed, possesses great advantages, and to anyone thoroughly acquainted with Quarrying, Crushing Machinery, Loading, &c., offers an exceptional opportunity. Reply, with full particulars of previous experience, Box 1,520, office of THE SURVEYOR, 24 Bride-lane, Fleet-street, E.C. (2,550)

Modern Methods of Road Construction and Maintenance.

DISCUSSION AT THE SOCIETY OF ENGINEERS.

The paper entitled "Main Roads: Past and Present, and Modern Methods of Construction and Maintenance," which Mr. Frank Grove, engineer and county surveyor of Surrey, read at the last meeting of the Society of Engineers, produced a most interesting discussion, of which we append a report herewith. The contribution, we may mention, was reproduced in our issue of last week. Mr. Norman Scorgie, M.INST.C.E., the president, occupied the chair during the proceedings.

Mr. H. Percy Boulnois (Westminster) opened the discussion. It had, he said, given him great pleasure to hear Mr. Grove's paper, and he desired to tender to the author his congratulations for the research he had undertaken in the preparation of the contribution and the practical knowledge of the subject that he had displayed. Taking the various points in the paper as they might be brought, in speaking of the French roads in the eighteenth century Mr. Grove had alluded to [illegible] the most important [illegible] highways [illegible] date—viz., the Routes Imperiales—after which came the Routes Nationale and the Routes Départementale. That was important, for any French engineer who knew the roads before 1870 would recognise the Imperial roads were left out. Before the Franco-Prussian War he was engaged as an [illegible] engineer on a railway in France, and had a considerable knowledge of the French roads of that date. The author had stated that the majority of the old Surrey roads were lacking in good foundations, and no doubt [illegible] suffered to some [illegible] for the laxity of the past. Telford might have intended to put proper foundations to the roads, but many of the highways constructed by him when broken open were found to be lacking in that respect. Fortunately, however, in the passage of time the metal had become sufficiently consolidated in many cases to render unnecessary the construction of fresh foundations. He was glad to see that a tribute was paid to flint roads—he was speaking entirely of water-bound macadam to begin with. He had constructed miles of roads for light traffic in the old days, and for that class of road there was nothing better than flint. He agreed, of course, that it was not as strong as a granite road; but, as had been pointed out, the constant flooding of a granite road did it a great deal of harm, whereas a flint road did not seem to suffer to the same degree. He thought a flint road drained better than a hard water-bound macadam road. After all, water was, as they knew, as great an enemy to roads as traffic. In regard to the damage done to roads by the sucking action of the rubber tyres of motor cars, his own opinion was that the principal damage was caused, not by sucking action, but by the brushing action. He would give them an instance of that which he thought confirmed his theory. At Waterloo Station there was a new method in which taxi-cabs assembled for the purpose of picking up passengers. These vehicles never moved except at a crawl, but the near-side channel of the road had worn into a deep groove, while the main body of the road had scarcely worn at all. He thought this was a proof that the brushing action of the wheels was disastrous to the pavement, which was wood. The same brushing action took place when the motors changed speed, as the wheels rotated quickly without the vehicle progressing to the same extent. Mr. Grove had spoken rather favourably of hand tarring, but later on had drawn attention to the various machines now on the market to which spreaders and brushes were attached. What was his view with regard to the advantages, if there were any, of using a machine as against hand tarring? His (the speaker's) opinion was that the machine had many advantages: first, it enabled them to do the work more expeditiously; secondly, it made it possible to regulate the amount of tar applied; and thirdly, by using a pressure machine one got two effects—a blast of hot air which blew away the last particles of dust, and then the tar was finely atomised and driven into the road. Those were points in favour of the machine. The gritting of the road after the application of the tar had been mentioned by Mr. Grove, but he had the impression that in Surrey they did not approve of putting grit and chippings on the surface of the road. Tarred slag had also been spoken of favourably in the paper, and he (Mr. Boulnois) confessed he was a convert to that material. When it was first introduced he could not believe that an artificial material like that could be so hard and so useful for road making as granite, but from what he had seen in various parts of the country, it seemed to him that tarred slag improved up to a point with wear, and did not move in the same way as tarred granite. As to rolling, there, again, there was room for improvement. Rolling had now reached a stage when it wanted more scientific treatment. What was required was a machine that would give a light weight to start with and a heavier weight for final consolidation. It was claimed that the three-axle roller effected this, in addition to avoiding the waviness with which they were occasionally troubled. The author did not seem very favourably impressed with pitch-grouted macadam. There had, of course, been great failures with that material, but there had also been some great successes—at Hornsey, for instance, where Mr. Lovegrove had mastered the subject very thoroughly. He was at one time a great advocate of hardwood paving, but the material had failed to some extent, he thought, because it was too hard. The arrises chipped off and they got an uneven road, and his view was that the only really scientific method of employing hardwood was to be found in sectional blocks. In regard to the question of bituminous surfaces, many of them believed that the carpeting system would be adopted in the road of the future. Engineers appeared to be trying to make an artificial natural road asphalt—trying to improve on Nature! He congratulated Mr. Grove on the diagrams and the explanations he had given of the plant described in his paper. As to the submerged reinforced-concrete kerbs, he agreed with the author that the haunches of the road should be thoroughly strong. He had seen many failures owing to the spreading that took place, but if the haunches were made strong enough that would not occur. He congratulated Mr. Grove on the figure at which he produced his carpet and base coat; it was exceedingly reasonable if it were done at 4s. 6d. per square yard. Concluding his remarks Mr. Boulnois said he honestly believed that the improvements in the roads had been considerably helped by the assistance of the Road Board. If it had not been for the money which they had contributed many of the counties—with the exception of the richer ones—could not have done what they had done. He had seen roads all over Europe, and he maintained that the roads of this country were the best in the world. He had an opportunity some two years ago of seeing some of the Spanish roads. Those were too terrible for words, and he had heard that a week or two before he went out a mule was drowned in one of the ruts.

Mr. H. T. Chapman, county surveyor of Kent, observed that Mr. Grove's paper was most interesting, and he was sure they were all deeply indebted to him for it. He thought the duties of road engineers were never more difficult than they were at the present moment. The task that they had before them was to make roads with an insufficient supply of proper materials or other facilities. It was at present almost impossible to get imported materials, and it would be more than ever necessary to utilise local materials to their fullest extent, and this, he thought, they could do only by treatment in some bituminous method, as was being done in Surrey and Kent. He was, perhaps, more interested in the particulars as regards bituminous carpeting than any other portion of the paper. Single-coat work was no use where there was heavy traffic. He had experienced that already, and unless some base coat was provided for the carpet to be laid on, they were going to have trouble. He was utilising local materials, such as flint and crushed shingle, treated with pitch and surfaced with bitumen. He did not quite agree that the waviness which occurred in road surfaces was in all cases due to the

effects of the rolling. His view was that this came with the motor-bus and heavy fast-moving traffic of the present day, and would be encountered however good the surface was to start with. No doubt it would be gradually reduced by scientific methods of rolling, and he agreed that the practice of rolling from the sides to the centre to commence with was better than longitudinal rolling. Granite-sett paving was a matter that had not been mentioned to any extent, of course, on rural roads carrying light traffic they could not afford that at the present time, but in the case of many of the roads he had experience of in Lancashire and in the neighbourhood of the large county boroughs this had proved the most economical paving. In regard to the use of Portland cement as a filler, he thought Mr. Grove would agree with him that there was no cementitious value required, and that it was simply used to make a particularly dense mixture. He had used pulverised clay, ground as fine as Portland cement, with equally good results. Also in pitch-grouted work he had used, instead of sand, the same filler, with a low specific gravity, and had found that the result was that a very much larger area could be treated with the same weight of material, and that there had not been softening owing to high temperatures in the summer.

Mr. F. Wilkinson, deputy borough engineer of Wimbledon, stated that in his district flint roads after having been tarred stood better during the winter months than any of the tarred macadam roads. He thought that was due to the thicker coat of tar that could be put on the flint roads. Last summer they laid down asphalt on one of their roads and watched motor cars and 'buses going over it, and he agreed with Mr. Boulnois that it was the brushing action which began the corrugations in the road where the stopping and starting of vehicles went on, and that they were deepest at those points. As to machine versus hand spreading, so far as his observations had gone, the machine-spreading beat the hand-spreading any time, although his chief, Mr. Coopér, was a firm believer in hand-spread tar. If engineers paid more attention to tar-macadam, he thought it would come out much better than any of the asphalt or bituminous roads that had been laid. His belief was that the tar-macadam slag road was the road of the future. As a means of overcoming the trouble of corrugation, Mr. Cooper had tried the experiment of putting down a large steel plate in front of the roller, as the roller in changing direction rested twice as long at that point as at any other, and so would tend to cause corrugation if the plate were not used. He agreed that the figure of 4s. 6d. for the carpet and base coat was very low indeed. He did not know anything about three-axle rollers, except that the roads over which they were used seemed to be quite as wavy as those consolidated with two-axle rollers. The paper did not say anything about reinforced concrete foundations. A good foundation was everything in a road. He would like to know whether the author had had any experience of reinforced concrete roads; if so, what conclusions had he come to with regard to them?

Mr. W. H. Grieves, engineer and surveyor to the Sutton, Surrey, Urban District Council, said he quite agreed that flint roads were excellent for light traffic roads, especially when they could be tarred every summer; in fact, he did not know of a road in which they secured better penetration of the tar. He had found some recently where the penetration after two years appeared to be at least 2 in. The work was done with a tar-spraying machine, and he favoured a machine as against hand-tarring, although the latter was cheaper. The difference in cost, however, only ranged between 1d., 1½d., and 1¾d., including everything. He agreed with Mr. Grove that wood paving was an excellent paving to lay, but he did not quite agree with him in regard to the thickness of the concrete foundation; in these days, owing to the severity of the motor traffic, a foundation of not less than 8 in. to 9 in. was required. As to the corrugations, these were found in the old-fashioned macadam roads, and were not only formed by the traffic, but by the action of water probably more than anything else. When a severe rainstorm occurred, little rivulets flowed from the centre to the side of the road, and this was where many of the corrugations appeared. It was a very intricate problem to solve, especially on macadam roads; but he had no hesitation in saying that even the waves on bituminous roads would be eventually overcome.

Mr. W. Menzies, highways surveyor to the Egham Urban District Council, observed that road surveyors knew perfectly well that the damage as a result of the opening of roads by gas, water, electric and other companies was one of the most trying things they had to put up with, and he thought some authority, such as the Road Board, should take steps to obtain power by which the various companies could be compelled to restore the roads to the *status quo*. Mr. Groves, in referring to one-coat tar-macadam work, advocated that "after being subjected to traffic for a month or two the surface should be dressed with tar and chippings so as to fill up all voids." He would like to know why there should be that interval in the operations. He generally found it was better to do the work as soon as possible after the tar-macadam had been laid rather than give the traffic a chance of wearing off the surface of the newly laid material. Mr. Groves had also asserted that wood-block paving "is perhaps the best form of construction for roads with a great amount of traffic, particularly upon motor-omnibus routes." No mention was made, however, of granite-pitched cubes, which, in his view, would be the road of the future.

Mr. Percy Griffith (Westminster) remarked that the last speaker had not been very complimentary to the companies responsible for the gas, water and electric light services. Those authorities, however, did not, as a rule, open the roads for fun. The work was costly, and was not undertaken without serious necessity. The filling of trenches and maintenance of the disturbed surface was costly work, and if subways could be provided for the reception of the pipes and cables the companies would use them with pleasure. As a matter of fact, it was becoming a general practice to leave the repair of the roads in the hands of the surveyor, and pay for the work; in that case he could not grumble at the state of the roads afterwards, although probably the users of the roads did not find the result much better than when the gas and water companies did the work themselves. The subject was a difficult one, but it must not be forgotten that the pipes laid under the roads were a necessity to the community as the roads themselves.

Mr. T. E. Ware, highways surveyor to the Epsom Rural District Council, stated that for fourteen years he had followed the practice of tarring roads by hand, but this year, owing to the scarcity of labour, he had been compelled to adopt machine work. He did not agree with Mr. Boulnois that tar projected on to the road was any use at all; they got absolutely the best results where the tar was allowed to sink into the road. He should like to know exactly how to stop corrugations. He agreed with Mr. Chapman that corrugations were not all due to the roller, although in some cases [illegible] by it.

Mr. E. H. Collcutt (Surrey) said that the gentleman who had so ably championed the cause of the gas and water companies had mentioned that in many cases the work was left in the hands of the road authorities. Did he refer to the reinstatement of the surface alone or to the actual filling of the trench? The difficulty seemed to be with regard to the latter, and the repair of the surface was a comparatively simple matter if the subsidence due to bad consolidation lower down could be avoided.

Mr. Griffith was understood to reply that he referred to the repair of the surface only.

The President (Mr. Norman Scorgie), in closing the discussion, also referred to the reinstatement of roads, but said he could not agree that the difficulty arose from the badly filled-in trench. He was sure everyone would realise, and no one more so than those having charge of roads, that, however well a trench was filled in, the road could never be brought back to precisely the same condition it was in before an opening was made. One realised that gas and water, particularly the latter, were a necessity of life, but what engineers complained about more than anything else was that the companies would not take the opportunity of doing their work before a road was made up. Frequently they were advised that a certain road was to be dealt with, but took no notice until the work was finished. He was certain everyone was interested in Mr. Boulnois' remarks in opening the discussion, and he would like to support his observations with regard to the condition of British roads; there were no highways in any other country comparable with those of this

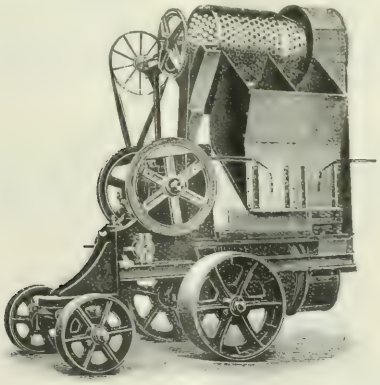
country. He had travelled over some thousands of miles of Continental roads but had nowhere found roads equal to their own. In Austria they had a method of darning the roads, but the difficulty here was that one could not get a man to "marry" his new work into the old. He would like to give a word of warning to those engineers who might be inclined to adopt the use of excavated road material mixed with new for the bottom coat of a bituminous road, for, however carefully one might screen the old material, there was undoubtedly a slight film of uncementitious material adhering to the old stone, and it was questionable whether with that they would get the bottom to adhere to the granite so as to get a solid mass after rolling.

Mr. GROVE, in replying, said he would be pleased to add a reference in his paper to the French Routes Imperiales, spoken of by Mr. Boulnois. He was entirely in agreement with him as regards their roads, but with regard to the wear of the wood paving in Waterloo Station, mentioned by Mr. Boulnois, he might suggest that this was probably due to the sudden manner in which the drivers put on their brakes, causing the wheels to skid. Opinions differed as to the merits of hand and machine tarring, but the results achieved by hand in Mr. Ware's district for many years had been superior to those obtained by machine; he seemed to be able to get the tar well into the stone by the hand method. Like Mr. Chapman, they were suffering in Surrey from the inability to obtain material for roads. He agreed that single-coat work, except under favourable circumstances, was not satisfactory as compared with double-coat work. They had little sett paving in Surrey. In regard to gas, water and other trenches, he must say that he was of opinion that if the local authorities [illegible] was laid and saw to the filling and ramming right from the start they would make a much better job of it than the companies. It was not much good trying to prevent the subsidence of the surface if the ramming was not properly done in the first place. In regard to the point as to leaving the road for a month before tarring the surface, when the roller left the road the material was not thoroughly consolidated, and it was necessary for the traffic to do that.

DUBLIN SPRING SHOW EXHIBITS.

"ACME" STONEBREAKERS.

Among the exhibits at the Dublin Spring Show last week was one of the Leicester firm of Messrs. Goodwin, Barsby & Co.'s portable automatic stonebreakers, with lower and upper screens, elevators, loading hoppers, &c., a design which is much favoured by county and town councils. Out of the eighteen



Irish county councils using the patent "Acme" stonebreaker, this is the machine usually preferred.

Wexford County Council (Mr. W. F. Barry, ASSOC.M.INST.C.E., county surveyor) have just placed an order with the firm for a third machine of this class, and the company have on order a similar machine for the Kilkenny County Council (Mr. A. M. Burden, ASSOC.M.INST.C.E., county surveyor).

INSTITUTION OF MECHANICAL ENGINEERS.

PRESIDENTIAL ADDRESS.

Dr. W. Cawthorne Unwin, F.R.S., on Friday evening last delivered his inaugural address as president of the Institution of Mechanical Engineers.

Nothing was more significant in the last half-century, said Dr. Unwin, than the growing importance of engineering. The engineer was more and more looked up to for the solution of industrial, civic and national problems. The war had not left us as we were before. In standing shoulder to shoulder in a common cause, in consenting to some abbreviation of liberty, we were losing a little of our extreme belief in individualism and our suspicion of State action, and that was likely to increase the sphere of work and the demand for the expert knowledge of the engineer.

After touching on the work of the institution, and the part it had taken, in association with the Institutions of Civil and Electrical Engineers, in recruiting an engineer unit for the new Royal Naval Division, and making a short allusion to the subject of meetings which, to meet the wishes of country members, are now being held in local centres, the president went on to speak of the institution's examinations.

EXAMINATIONS.

Membership was accepted as, to some extent, a certificate of competence, and its value was due to the fact that entrance to its ranks was guarded. A candidate must be proposed, must state his qualifications, and must run the gauntlet of strict scrutiny by the council, and finally by the members at large. Mistakes might be made, for it was human to err at times, but great care was taken.

"The appraisement of the qualifications of candidates," Dr. Unwin proceeded, "is not easy, and is specially difficult in the case of younger candidates who have no long record of work. Hence the institution, following the example of the civil engineers, the architects, the surveyors, and others, has instituted an examination for candidates under thirty years of age. No doubt an examination test is not infallible, but it more often lets through the doubtful than it excludes the qualified. Dr. Welldon, when pointing out some evils of crude methods of public competitive examination, said that the attaining [illegible] standard rather than supremacy over competitors was the best means of selection. Now, our examination is of that type. Also the diplomas of various universities and technical schools, granted on conditions which are trustworthy, are accepted in lieu of our own examination.

"The examination does secure that young engineers are stimulated to study seriously principles involved in engineering practice and mathematical tools useful to the engineer. Though the examination looks like an obstacle, I do not think that in after life any one who passed it will complain that he was driven to study at a time when the mind was receptive and tenacious, 'wax to receive and marble to retain.'"

RESEARCH.

The president observed that the institution had distinguished itself very honourably by fostering research in subjects important to engineers. Some of them who moved in professorial circles get perhaps a little tired of the insistence on the importance of research for students. Research for the solution of new problems was of great importance, but it was not a task for young and immature students. Many so-called researches, in which well-understood methods were applied to materials or subjects not themselves important, hardly deserved the name. They amounted to little more than class exercises. Most scientific societies received papers in which a much over-elaborated description was given of known proceedings and precautions, in which the new results were of limited value without establishing any general law. But the value of real research, based on a clear formulation of a definite unsolved problem, could not be over-estimated.

Unfortunately, in engineering, the solution of unsolved but important problems was generally both difficult and expensive. Much, no doubt, was done by manufacturers who had a financial interest in the work. But their researches were, in general, not fully published. It was of great interest to the public at large and to other engineers that a scientific institution like theirs felt it part of its duty to advance knowledge by research, and was able to devote a

fraction of its income for such researches as were beyond the means of private engineers. In most cases a Research Committee of the institution began by an investigation of what had been done before, and the summary of previous investigations which the institution published was not only a safeguard against mere repetition of experiment, but was valuable in itself. Prof. Martens, the director of the great State laboratory at Grosslichterfelde, had said that in four cases out of five when a manufacturer brought him a problem it was found that it had already been solved somewhere by somebody.

TESTING MATERIALS.

In some remarks on this subject Dr. Unwin pointed out that, whereas half a century ago most materials of construction were selected and bought on the reputation of the manufacturer, hardly any material in large use now was accepted without special testing in the interest of the purchaser.

"On the Continent and in the United States there are," he said, "public laboratories, supported by the State, where anyone can have tests made, at moderate fixed rates, by a trained scientific staff, and with great accuracy. Such institutions assist industry if on the one hand they meet industrial requirements, and on the other are unbiassed by private interests. They have the advantage over private laboratories that they are under the direction of experts of exceptional experience and reputation, and are able to pursue investigation, continued often for long periods, beyond immediate requirements into fruitful by-paths. The view taken in Germany is that the work accomplished is partly of advantage to the manufacturer who calls for assistance, and so far should be paid for by him, and partly is of advantage to the nation in advancing science, which is the justification for a State subsidy. Hence it is incumbent on the public institution to publish results as freely as is possible without injuring private interests.

"At Grosslichterfelde the annual income from fees for testing amounts to £20,000, and the annual State subsidy is £12,000. On the staff there are 230 persons, of whom 75 have had university training and 38 technical high school training. Since 1880 the work accomplished has steadily and regularly increased.

"The Bureau of Standards at Washington is on a still larger scale, and does very similar work. It receives an annual subsidy from the Federal Government of £100,000. The equipment is extraordinarily complete. For instance, it has a 600-ton testing machine at Washington, and a 1,000-ton testing machine at Pittsburg, both of the highest sensitiveness and accuracy. Such machines do not exist in this country. Happily, we have now a similar institution in the National Physical Laboratory at Teddington. Its functions are somewhat restricted by the characteristic English jealousy of State action, which, I think, is diminishing. It would be difficult to overestimate the service it has done in the solution of various mechanical, electrical and physical problems which were unlikely to be attacked by private persons."

Concluding, the president remarked that ordinary tests were of a somewhat arbitrary character, and did not completely imitate the conditions of actual service. We tested specimens of steel to destruction, and measured ductility by plastic deformation, though in use the stresses did not exceed the elastic limit and the deformation was elastic. We tested cement in tension, and used it in compression. There was need for constant criticism of methods of testing and for the invention of new tests—such as tests for hardness and brittleness—although new tests must be cautiously introduced.

One small change could be easily made, and in some cases would be interesting. When a set of tests on a material had been made, the mean of the results was taken as the best value of the property measured. In physical investigations generally a further step was taken by calculating what was termed the "probable error," which, broadly, was a measure of the trustworthiness of the results. Calculation of the probable error was troublesome, but Martens had pointed out that the "mean error" was nearly as accurate, and good enough for practical purposes. The mean error was the sum of the deviations of the individual results from the mean, irrespective of sign, divided by the number of observations. The mean error was conveniently expressed as a percentage of the mean value. If the mean error was large, either the method of testing, the uniformity of the material, or the preparation of the test specimens was at fault. Generally the source of the error could be inferred. A large mean error in tests of steel would indicate want of uniform quality in the material, in cement—probably faults in preparing the test biquettes. Of two supplies of a material, that with the smallest mean error was preferable.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

METROPOLITAN DISTRICT MEETING.

At a Metropolitan District meeting to be held at 92 Victoria-street, Westminster, on April 30th, at 7.30 p.m., a discussion will take place on "The Heavy Traffic Problems of London."

Members in Greater London are specially invited.

SCARBOROUGH MEETING.

An institution meeting will be held in the North-Eastern District at Scarborough on Saturday, May 8th.

PROGRAMME.

10 a.m.—Assemble at the town hall.

10.15 a.m.—Reception by his Worship the Mayor (Mr. C. C. Graham). A paper entitled "Catering for the Wants of the Holiday-maker," by Mr. Harry W. Smith, Assoc.M.Inst.C.E., borough engineer and surveyor, will be taken as read. Any discussion thereon may take place at the close of the meeting after the various works have been inspected.

10.45 a.m.—Inspection of Spa improvements, beach bungalows, South Cliff Gardens, bathing pool, &c., in the South Bay.

1 p.m.—Lunch at the Grand Hotel. (Tickets, 3s. each.)

2 p.m.—Meeting of the members of the North-Eastern District to consider—

(*a*) The report of the Executive Committee as to the desirability of reporting the proceedings of district meetings in the Press.

(*b*) Any other business.

2.30 p.m.—Leave the Grand Hotel by char-à-banc (tickets 2s. each) for the Castle Hill, to view the damage caused by the bombardment on December 16, 1914, by the German battleships, and to inspect the Keep.

3.15 p.m.—Leave the Castle Hill, and inspect the Alexandra Gardens, Floral Hall, Peasholm Park, and the beach bungalows and bathing establishment in the North Bay.

4.30 p.m.—Leave the north end of the Royal Albert-drive by motor char-à-banc for drive along the Marine-drive, Valley Park, to the Mere.

5.15 p.m.—Afternoon tea at the town hall by the kind invitation of his Worship the Mayor (Mr. C. C. Graham).

AYR MEETING.

At the Scottish District annual meeting to be held at Ayr on June 4th and 5th, papers on town planning, municipal housing, road work, and scraping of water mains will be submitted.

On the first day visits will be paid to the municipal works of the town, and the following day will be devoted to inspections of experimental road stretches in Ayr County and Hillhouse Quarry, and to a visit to Loch Doon.

MATLOCK MEETING.

The arrangements for the institution meeting to be held at Matlock on June 12th include visits to the new sewage works, the brine and electric baths, and other undertakings.

J. W. Dudley Robinson,
Secretary.

92 Victoria-street, S.W.

INSTITUTION OF MUNICIPAL ENGINEERS.

SOUTHERN AND SOUTH-EASTERN DISTRICTS.

A visit will be paid to-morrow (Saturday) to the New County Hall Works of the London County Council.

Members will meet on the site of the works, Belvedere-road, Westminster Bridge, at 2.30.

The contract now in progress embraces roughly some three-fourths of the complete building (the northern blocks being not yet commenced), and the bulk of the work is at about second floor level.

Arthur Palmer,
Hon. District Secretary.

Town Hall,
Greenwich

APPOINTMENTS VACANT.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* WEDNESDAYS *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

INSPECTOR OF NUISANCES.—April 26th.—Ross-ford Rural District Council. £130—£150 per annum. —Mr. T. W. V. Greenwood, clerk.

INSPECTOR OF NUISANCES.—April 27th.—Hindley Urban District Council. £100 per annum. Mr. T. Roberts, clerk.

TEMPORARY SURVEYOR AND INSPECTOR OF NUISANCES.—April 29th.—Halstead Urban District Council. £3 per week. Mr. Robert Mann, Council Office, 24 High-street, Halstead.

ROAD FOREMAN.—April 29th.—Tilbury Urban District Council. 35s. per week, and 3s. per week war bonus.—Mr. S. A. Hill-Willis, engineer and surveyor, Council Offices, Tilbury.

ASSISTANT ROAD FOREMAN.—April 30th.—Corporation of Ealing. 42s. per week.—Mr. W. R. Hicks, borough engineer and surveyor.

ASSISTANT ENGINEER. — May 1st. — Colombo Municipal Council. Rs.4,500/- per annum, with a commuted allowance of Rs. 900/- per annum. Mr. R. Eustace Tickell, Institution of Civil Engineers, Great George-street, Westminster, London, S.W.

ROAD FOREMAN.—May 1st.—Dentdale Town Council. Mr. E. Parry, town clerk.

INSPECTOR OF NUISANCES.—May 3rd.—Corporation of Bradford. £90 per annum. Mr. F. Stevens, town clerk.

BOROUGH SURVEYOR.—May 3rd.—Corporation of Newark. £250 a year.—Mr. Godfrey Tallents, town clerk.

BOROUGH SURVEYOR. — May 15th. — Newport (I.W.) Town Council. £225—£250 per annum.—Mr. T. Ross Pratt, town clerk.

CLERK OF WORKS.—Tyldesley Urban District Council. £2 10s. per week.—Mr. Francis E. Jones, engineer and surveyor, Council Offices, Tyldesley.

ASSISTANT ENGINEERS.—Public Works Department, Government of the Gold Coast. £350—£400 a year, with furnished quarters.—Crown Agents for the Colonies, Whitehall-gardens, London, S.W.

MUNICIPAL COMPETITIONS OPEN.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* WEDNESDAYS *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

GALEMIRE.—Designs for a small hospital, for the Galemire (Whitehaven) Joint Hospital Committee.—Mr. E. B. Croasdell, clerk, Union Hall, Whitehaven.

MUNICIPAL CONTRACTS OPEN.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* WEDNESDAYS *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

Buildings.

CAMPBELTOWN.—April 24th.—For repairs and renewals to woodwork at old quay, for the corporation. —Mr. J. Fullerton, master of works.

RATHDRUM.—April 26th.—For the erection of fifty-nine labourers' cottages, and ten cottages in pairs, for the rural district council.—The Clerk.

BUCKLOW.—April 27th.—For the construction of a concrete tube culvert, for the rural district council. —Mr. R. C. Cordon, highway surveyor, Cranford-avenue, Knutsford.

UXBRIDGE.—April 27th.—For the erection of a corrugated-iron bathing shed, for the urban district council.—Mr. W. L. Eves, surveyor, 54 High-street, Uxbridge.

DUNDALK.—April 27th.—For alterations to buildings, and the erection of boundary walls, for the urban district council.—The Surveyor.

GLASGOW.—April 28th.—For the erection of two tenements, for the corporation.—Office of Public Works, 64 Cochrane-street.

NEWYLN.—April 28th.—For the construction of a reinforced-concrete face wall, for the Pier and Harbour Commissioners.—Messrs. Douglass, Lewis & Douglass, 15 Victoria-street, Westminster, S.W.

GLASGOW.—April 29th.—For the wright and joiner's work in connection with the erection of a sanatorium and children's home, for the corporation. —Office of Works, 64 Cochrane-street, Glasgow.

LINTHWAITE.—April 30th.—For the erection of twenty-four houses, for the urban district council.—Mr. J. Ainley, architect, Chapel-street, Slaithwaite, Yorks.

DARTON.—May 10th.—For the erection of boundary walls and other works, for the urban district council. —Mr. S. Wilkinson, surveyor.

Iron and Steel.

RICHMOND (Surrey).—May 5th.—For the supply of 100 tons of heavy cast-iron pipes and special castings, for the corporation.—Mr. J. H. Brierley, borough surveyor, Town Hall.

ST. PANCRAS.—May 11th.—For steel constructional work, for the borough council.—Mr. C. H. F. Barrett, town clerk.

GOSPORT AND ALVERSTOKE.—May 13th.—For the supply of a pair of 18-in. stroke horizontal cross high-pressure, double-acting air compressors, with all necessary valves, pipe connections and foundations, for the urban district council.—Mr. H. Frost, engineer and surveyor, Gosport.

Roads.

AIRDRIE.—April 26th.—For the supply of road metal, kerb and channel work, granolithic paving and carting, for the corporation.—Mr. J. K. Frazer, burgh surveyor.

BURGESS HILL.—April 26th.—For the supply of granite and 10,000 gallons of refined coal tar, for the urban district council.—The Surveyor.

WARMLEY.—April 26th.—For making up a road, for the rural district council.—Mr. H. W. Bennett, surveyor.

WIGAN.—April 26th.—For the supply of granite setts, for the corporation—Mr. A. T. Gooseman, borough engineer.

EASTBOURNE.—April 26th.—For the execution of private street works, for the corporation.—Mr. A. E. Prescott, borough surveyor.

HETTON-LE-HOLE.—April 26th.—For the supply of tarred slag and slag, for the urban district council. —Mr. J. Harding, surveyor.

SOUTHWICK.—April 26th.—For the supply of flints and flint gravel, for the urban district council. —Mr. J. S. Mant, deputy surveyor.

ST. NEOTS.—April 27th.—For the supply of broken granite, basalt, tar-macadam, and slag dust, for the urban district council.—Mr. J. Edey, surveyor.

WHITSTABLE.—April 27th.—For the supply of flints, hoggin, brick rubbish, sand, ballast, crushed flints, tar, cement, tar-macadam, and steam rolling, for the urban district council.—Mr. F. Laurens, surveyor.

BLACKPOOL.—April 29th.—For the supply of 2,200 tons of 2-in. tarred granite stone, and 500 tons of ¾-in. tarred granite chippings, for the corporation.—Mr. John S. Brodie, borough surveyor.

SAFFRON WALDEN.—May 1st.—For the supply of granite macadam and granite chips, for the corporation.—Mr. A. H. Forbes, borough surveyor.

ROMFORD.—May 3rd.—For the supply of broken granite and granite chippings, for the urban district council.—The Surveyor.

SWANAGE.—May 3rd.—For providing material and labour for tar-spraying, for the urban district council.—Mr. W. H. Pearce, surveyor.

ELHAM.—May 4th.—For the supply of granite and basalt, for the rural district council.—The Highway Surveyor, Lyminge, Kent.

FULHAM.—May 5th.—For making up a new street, for the borough council.—Mr. F. Wood, borough surveyor.

LEXDEN AND WINSTREE.—May 8th.—For the hire of one or two steam road rollers, for the rural district council.—Mr. Jean Emans, surveyor, Lexden, Colchester.

MOUNTAIN ASH.—May 11th.—For the execution of street improvements, for the urban district council.—Mr. W. G. Thomas, surveyor.

EAST GRINSTEAD.—May 12th.—For making up a road, for the rural district council.—Mr. C. Turton, surveyor, 6 High-street, East Grinstead.

EAST STOW.—May 19th.—For surface-water draining, kerbing, channelling, and road making, for the rural district council.—Mr. Henry E. Wilkes, clerk, Market-place, Stowmarket.

Sanitary.

NEW ROSS.—April 26th.—For the construction of sewerage works, for the urban district council.—The Clerk.

ROTHERHAM.—April 26th.—For laying stoneware pipe sewer, for the rural district council.—Mr. B. Hey, engineer.

KEIGHLEY.—April 26th.—For the construction of a pipe sewer, for the corporation.—The Borough Engineer.

CAERPHILLY.—April 27th.—For the construction of sewers, drains and house connections, for the urban district council.—Mr. A. O. Harpur, surveyor.

RHONDDA.—April 27th.—For laying stoneware sewer pipes, for the urban district council.—Mr. E. H. Barber, engineer and surveyor.

COLCHESTER.—April 27th.—For the underdraining of a cemetery site.—Mr. G. T. Forrest, county architect, 79 Duke-street, Chelmsford.

HOLLINGBOURNE.—April 28th.—For the construction of a sewer and manholes, for the rural district council.—Mr. H. M. Apps, sanitary inspector, Sutton Valence, near Maidstone.

LLANTRISANT.—April 29th.—For sewer extension and surface-water drainage, for the rural district council.—Mr. T. Saunders, surveyor.

BRANDON AND BYSHOTTLES.—April 30th.—For works of sewerage, for the urban district council.—Mr. A. A. Luxmoore, 5 North Bailey, Durham.

RAWMARSH.—For relaying part of the main sewers in the South Ward, comprising about 700 yds. of 18-in. pipes or tubes, and 700 yds. of 9-in. pipes, with manholes, flushing chambers, and ventilation shafts, for the urban district council.—Mr. J. A. Tonge, engineer, Parkgate, Yorks.

TENDERS FOR MUNICIPAL WORKS OR SUPPLIES.

The Editor invites the co-operation of Surveyors with a view to making the information given under this head as complete and accurate as possible.

* Accepted. † Recommended for acceptance.
‡ Provisionally accepted.

BENTLEY.—For the supply of tar-macadam, whinstone and dross, for the urban district council.—Mr. R. G. Whitley, surveyor:—

Whinstone.—Shap Granite Company, Westmorland.
Slag.—Aizlewood & Sons, Rotherham.
Tarred Macadam.—Contract and Works Supply Company, Scunthorpe.

BISHOP'S STORTFORD.—The following tenders have been accepted by the urban district council:—

Brooms, Picks, Shovels and Sundries, Cylinder and Gas-engine Oil and Disinfectants.—H. Sparrow.
Rotary Brushes, Buckets, Spikes and Sponge Cloths.—Mosers, Limited.
Road Picks, Mud Scoops, Grafting Tools and Contractors' Forks.—Yates & Co.
Machinery Oil.—Vacuum Oil Company.
Iron Castings, Stoneware Pipes and Gullies, and Portland Cement.—W. Hughes.
Wrought-iron Tubing.—J. Russell & Sons.

INCE.—For the construction of sewage disposal works, for the urban district council.—Mr. A. T. Swain, engineer and surveyor:

J. Bentley, Bradford	£13,550
W. J. Beckett-ish, Wigan	[illegible]
H. E. Buckley, Bradford	13,000
Smith Brothers, Burnley	12,734
F. E. Bates, Goole	[illegible]
W. Jowett, Preseot	11,[illegible]
Bentley & Jubb, Wigan	[illegible]
Clegg Brothers, Burnley	[illegible]
Cowburn & Sons, Hindley	10,555
J. & H. Houghton, Wigan	10,461
Webster & Winstanley, Wigan	[illegible]
J. Horrocks, Westhoughton	10,164

LYNN.—Tenders for the supply of road materials for the year ending March 31, 1916, have been accepted as follows:—

Sommerfeld & Thomas, Limited.—Whinstone granite at 12s. 6d. and 13s. 6d. per ton.
Lancaster & Bateman.—Pebbles, granite at 7s. and 7s. per ton, and for Mountsorrel kerb and channels.
Ellis & Everard.—Bardon Hill granite and chippings from 13s. 2d. to 9s. 4d. per ton.
J. Collett & Son.—Tarred slag at 15s. 3d. and 15s. 6d., subject to sample being satisfactory.
E. P. Davis.—Tarred slag at [illegible] and [illegible], subject to sample being satisfactory.
Dawber, Townsley & Co.—Blue Staffordshire bricks at 85s. 6d.; wire-cut brindles at 106s.; stock bricks at 27s. per 1,000.

SALTASH.—Accepted for the supply of broken granite, granite chippings and Penryn [illegible] steam rolling, for the ensuing year:—The Rose Hill Stone Breaking Company and surveyor:—

Granite.—Groby Granite Company, Groby, near Leicester, 14s. 7d. per ton.
Rolling.—W. C. Symonds & Son, Saltash, Essex, 9s. 6d. per day.
Flints.—Keeble Brothers, Maldon, 6s. 6d. per cubic yard.

PRESTWICH.—Accepted for the construction of a storm-water drain, tube sewers, and manholes, for the urban district council.—Mr. S. H. Morgan, engineer:—

A. & S. Hyslop, Manchester.

(Subject to the sanction of the Local Government Board being obtained to proceeding with the work at the present time.)

SCUNTHORPE.—Accepted for the supply of materials for the rural district council.—Mr. A. Culkin, surveyor:—

Whinstone.—Ord & Maddison, Limited, unbroken, 9s. 6d. to 10s. 7d. per ton; Ord & Maddison, Limited, 2-in. machine broken, 11s. 6d. to 12s. 7d. per ton; 2-in. machine broken, 11s. 9d. to 12s. 7d. per ton. Lunedale Whinstone Company, 2-in. machine broken, 9s. 6d. to 10s. 7d. per ton; 1½-in. machine broken, 9s. 6d. to 10s. 7d. per ton. E. Summerscale & Co., 2-in. machine broken, 9s. 6d. to 10s. 7d. per ton. Brookes, Limited, 2½-in. machine broken, 11s. 6d. to 11s. 7d. per ton. H. Mead & Co., 2½-in. machine broken, 11s. to 12s. per ton. Shap Granite Company, 1½-in. machine broken, 11s. 5d. to 12s. 7d. per ton.
1½-in. Tarred.—Cradock, Allison & Co., 15s. 2d. to 16s. 9d.
¾-in. Screenings and Dust.—Mountsorrel Granite Company, 13s. to 13s. 3d.
Asphalt.—Lunedale Whinstone Company, 14s. 6d. to 15s. 10d. Reserves—Ord & Maddison, Limited, 15s. 6d. to 16s. 7d.; Slag and Tar Macadam Company, [illegible] to [illegible].
Dry Slag.—H. Mead & Co. (2 in. to 3 in.), 6s. 8d. to 7s.; (2 in.) 6s. to 6s. 3d.
Tarred Slag.—Slag and Tar Macadam Company, 14s. to 16s.; mixed sizes, 14s. 6d. Reserves—H. Mead & Co., 12s. 9d. to 13s. 4d.; Hull Roadstone Company, 13s. 9d. to 14s. 6d.
Tar.—T. Ness & Co., 3¾d. per gallon, stations. Reserve—G. Hardman, Son & Co., 3¾d., less 2½ per cent discount, works.
Land Gravel.—G. M. Prescott, pit, 2s. 3d.; roadside, 3s. 11d. to 6s. M. M. Dunn, roadside, 4s. 6d. to 5s. 6d.
Hornsea Gravel.—C. H. Saxelbye, 5s. 7d. to 6s. 3d.
Brushes.—Hadden & Co., Limited, 16-in. scavenging brooms, 18s. per dozen; horse sweepers, 6s. per brush. Rookledge & Son, 16-in. scavenging brooms, 25s. per dozen; horse sweepers, 50s. per set of six.
Shovels and Spades.—J. S. Kaye & Sons, [illegible] per dozen; shovels, 19s. per dozen.

STILLY.—For building a pumping station and works, for the urban district council.—Mr. W. H. Cousins, surveyor:—

Contract No. 1: Engine-house.—Ford & Sons, Cheddar, Somerset, £78.
Contract No. 2: Steel Tower.—H. Brown & Co., Bristol, £92.
Contract No. 3: Pumping Plant.—H. Brown & Co., Bristol, £281.

ICKFIELD.—For the erection of a retaining wall and parapet wall at Crowborough, for the rural district council:—

J. Jarvis, Limited, Tunbridge Wells	£118
Connor Brothers, Crowborough	117
D. Wickens, Crowborough	[illegible]

MEETINGS.

[illegible] will oblige by sending early notice of [illegible] of meetings.

APRIL.

23.—Institution of Municipal Engineers: Visit to London New County Hall Works. 2.30 p.m.
27.—Institution of Civil Engineers: Annual General and Special General Meetings of Corporate Members. 8 p.m.
28.—Royal Sanitary Institute: Dr. W. Perrin Norris, chief medical officer, Medical Bureau, Commonwealth of Australia, on "The Evolution of Hygiene and Public Health in Australia." 5 p.m.
30.—Institution of Municipal and County Engineers: Metropolitan District Meeting at Westminster.

MAY.

8.—Institution of Municipal and County Engineers: Meeting at Scarborough.
28.—Institution of Municipal and County Engineers: North-Western District Meeting at Northwich.
29.—Institution of Municipal and County Engineers: Council Meeting.
29.—Royal Sanitary Institute: Meeting at Shrewsbury. Discussion on "The Value of Mechanical Filters in the Purification of Water." 7.30 p.m.

JUNE.

4-5.—Institution of Municipal and County Engineers: Scottish District Annual Meeting at Ayr.
7.—Institution of Municipal and County Engineers: Meeting at Matlock.
24-26.—Institution of Municipal and County Engineers: Annual General Meeting.
25.—Mr. Herbert Samuel opens the National Road Exhibition.

The Surveyor

And Municipal and County Engineer.

Vol. XLVII. APRIL 30, 1915. No. 1,215.

Minutes of Proceedings.

The Royal Commission and the New Central Authority.

The work of the Royal Commission on Sewage Disposal has occupied seven years, and during this period, it may surely be said without disrespect that the officers of the commission have received an education. If some of the statements in earlier reports drew forth severe criticism from the experts, it is to be gathered that the final report meets with better approval. When, however, one considers the immense amount of research work, the unusual opportunities of gathering experience, and the careful records kept of the results of work, it is apparent that the officers of the commission are now qualified in an unusual degree, not so much to write, a final report upon a subject which admittedly requires further investigation, but to continue their investigations. Who else could hope to do the work so well? The appreciative comments which have appeared recently in these pages, coming from those who are recognised authorities upon the subject, are worthy of particular attention, as they bear eloquent witness to the excellence of the work done and to the need for its continuance. If the facts stated by Mr. John D. Watson, chief engineer to the Birmingham, Tame and Rea District Drainage Board, in his "appreciation" of the work of the Royal Commission, were more generally understood, we should have a much clearer grasp of the present condition of affairs. Mr. Watson says that "there are hardly two sewages alike, and that even in the same town the leading characteristics of the sewage change as the town develops;" also that "no one who understands anything of the subject of sewage purification can honestly say that the problem has been solved." More than ever Mr. Watson is of opinion that each case needs the most careful consideration on its own merits, and he urges the importance of the establishment of a central authority provided with the means of carrying out research work on the same lines as that of the Massachusetts State Board of Health. Major Arthur J. Martin is of the same opinion, for he tells us that the "Final Report leaves many a vexed question unsettled," and that "the most important recommendation of the commissioners is designed to guard against the policy which has proved so disastrous in the past by the establishment of a central authority competent to keep our practice in the disposal of sewage and trade wastes abreast of modern progress;" he further is of opinion that, notwithstanding the fact that the times are not propitious for legislation, "Parliament might well spend a little time in giving effect to the commissioners' recommendation."

It is interesting to note how clearly Mr. A. P. I. Cotterell, the president of the Institute of Sanitary Engineers, follows the same idea. To make any hard and fast rule applicable to all cases is, he considers, clearly out of the question, and he strongly commends the recommendations of the commissioners to make the degree of purification dependent upon the character of the stream into which the effluent is to be discharged. Mr. Cotterell's statement that, "after all, to make the work to be done commensurate with the conditions to be met, and not with a hard and fast rule that makes no difference between evil and good is what we engineers are constantly striving to do," will be applauded by all those who have a real knowledge of the subject. Mr. Cotterell also very justly points to the fact that new sources of pollution will from time to time occur, also that the conditions at existing sources will necessarily change. "It makes one wish that the research work developed by the Royal Commission should not be allowed to drop upon their departure." Again, Mr. H. Gilbert Whyatt, the borough engineer of Great Grimsby, evidently holds the same idea—namely, that, as the result of the Royal Commission's work, we have for ever escaped the binding rules by which one method of disposal was held to be necessary for every kind of sewage. He, as one of the pioneers of reform, formerly urged that "the Local Government Board should be roused from its state of agnostical immobility"—that was in the day when land treatment was considered a *sine qua non*. It is now established "that the available methods of sewage purification are as diverse as the sewage itself; and we know the sewage of any ordinary town varies from hour to hour during the day." Mr. Whyatt does not, however, like all the other commentators, suggest the need for continued research work by the central authority, but this is probably due to the brevity of his comment, and it almost follows as the logical outcome of his remarks that he should be in agreement with the suggestion that the work—which has wrought such a beneficial change; and of which he was

formerly so powerful an advocate before the Royal Commission took the work in hand—should be carried on by the central authority without breaking the sequence of the operations. "The bars to progress would seem to be, in the first place, obsessions of various sorts—scientific, professional, and administrative—and, secondly, the striving for standardisation, which eventually becomes another name for stagnation," says Dr. Gilbert J. Fowler, and the reader may well understand how abhorrent the idea of settling down to the "comfortable belief that the Royal Commission has reported and all is now well" must be to one possessing the acute reasoning power and scientific ability of Dr. Fowler. He again demonstrates very clearly that continuous research work is necessary. We have reached a stage when, "at considerable expense and trouble, it is now possible, in the majority of cases, to obtain fairly satisfactory effluents, although not infrequently a nuisance is transferred from the river to the air, where it takes the form, not only of smells, but of flies and other noxious insects. The sludge problem is still unsolved." Clearly it is no time for standardisation or for a relaxation of effort.

It is clear that there is general agreement among the authorities quoted above, first, that the work of the Royal Commission, though admirable and useful, merely shows more clearly than ever before that original thought and treatment are required invariably in designing and working sewage disposal works, because the conditions must of necessity vary in every case, and what may be necessary, suitable and economical in one case may be unnecessary, absurd or wasteful in another; also that because the problem is by no means fully solved, and because of altering conditions, changes and progress, it is very necessary that the work started by the Royal Commission should be continued, and that for this reason a central authority should be created with the least possible delay. Further, we would urge, in order that the sequence of operations may not be broken, that those who are now qualified by their long experience should continue their work without a break as officers of the new central authority. If this is not done, it is obvious that an immense amount of the work done will be lost, or will have to be gone over again.

* * *

The Government and Road Board Grants.

At last week's meeting of the Gloucestershire County Council a most important resolution in regard to the distribution of Road Board grants for 1914-15 was moved by the Earl of St. Aldwyn. The resolution, which was carried unanimously, was in the following terms: "That this council protests against the requirements of the Treasury that the Road Board should make it a condition of a grant towards the improvement of certain roads that they should be satisfied as to the adequate maintenance of other roads towards which they have made no grants. That the Road Board grant of 1915-16 towards the scheme previously sanctioned by the Road Board for the use of improved materials upon the more important main roads in the county ought not to be largely reduced in order to relieve Parliamentary votes for war purposes at the cost of the road improvement fund from the charge of remaking roads destroyed by military traffic." It will be observed that the resolution deals with two matters—namely, the imposition by the Treasury of conditions in accordance with which grants by the Road Board are to be made, and the use of the funds of the board for remaking roads which have been destroyed by military traffic. In regard to the first matter, Lord St. Aldwyn pointed out that, under the Act by which the Road Board was constituted, the power of deciding upon any conditions to be attached to grants was vested in the board, and he contended that the action of the Treasury in the present instance was *ultra vires*. The avowed reason for the imposition of the condition complained of is to secure such a diminution in the ordinary grants as will provide a fund for remaking roads destroyed by military traffic. The result is that an item of purely war expenditure, which ought to be met by funds provided by the taxpayer, is in fact to be met out of a fund allocated by Parliament to the relief of the ratepayer. Moreover, as Lord St. Aldwyn further observed, the fund in question was specially provided from the motor-car and motor spirit duties to make or improve roads, and as the law now stands it cannot be touched for any other purpose. There appears to be good reason for the strong protest made by the Gloucestershire County Council, and inasmuch as copies of the resolution were ordered to be sent to the other county councils, it is probable that a good deal more will be heard of the matter. The County Councils Association, we note, had the question before them at their meeting on Wednesday, in London, and adopted a motion expressing disapproval of the Treasury's requirements.

* * *

Wombwell Surveyor and the Urban Councillor.

One of the local councillors who are in the habit of working themselves into a fury of excitement over financial matters, and, while in this heated condition, making statements that, to put it mildly, are difficult to prove, had rather a nasty fall recently at Wombwell. The gentleman in question, a member of the urban district council, issued an election address in which, referring to a particular work of sewerage carried out by the council, he made a cryptic allusion to "experiments having to be tried at any cost," and proceeded to allege that the contract, which a certain contractor offered to carry out for £1,100, had eventually cost £3,000. The surveyor, Mr. W. Quest, being professionally concerned as an official of the council, received the consent of the Sanitary Committee to reply to the statements made, and, in a clear, business-like speech, tempered with the spirit of sweet reasonableness, he was able to blow to the winds the suspicions that may have gathered around the election address if it had been allowed to go unchallenged. In the first place, there were no experiments to be tried either "at all costs" or by way of voluntary observation. In the next place, the scheme, which was carried out in its entirety by the Sanitary Committee, proved a particularly troublesome one, seeing that it included an unexpected difficulty in dealing with a large quantity of water, the bankruptcy of the contractors, and certain difficulties with another contractor involving the completion of the work by the council themselves. Finally, it was completed in fifteen months instead of two years as alleged by the councillor, and the nett cost was £2,498 in place of £3,000. The dissatisfied councillor, who, it is only fair to say, disclaimed any intention of referring to the surveyor—in his reply remarked that he would look carefully into the list of particulars to see that everything was put into the sewer as stated, which is suggestive of the inverted policy, Judgment first, then inquiry. The upshot was that the council passed, *nem. con.*, a vote of confidence in the surveyor, and the councillor was left to reflect upon the wisdom and utility of the adage which commends us to verify our references.

Professional Charges.

The recent issue by the Council of the Institution of Civil Engineers of an official statement in regard to the vexed question of professional charges will be generally welcomed by engineers. At the same time, as a step towards the establishment of a uniform basis upon which fees may be fixed, the statement should prove very serviceable to clients. The council has wisely refrained from laying down rigid rules to be applicable to all the varying circumstances of different cases. Indeed, it is expressly stated that engineers with larger experience command fees on a higher scale than younger men with less experience, and that the general rule laid down for remuneration at the rate of 5 per cent. upon the cost of works is liable to be varied in accordance with the nature and magnitude of the undertaking and the character of the services rendered. The preparation of bills of quantities, payments to resident engineers and inspectors, and personal travelling expenses are not necessarily to be regarded as included in the fees paid, and may be made the subject of special arrangement. An interesting part of the statement is that which deals with the respective rights of the engineer and client in plans and specifications prepared by the former. On this matter counsel's opinion has been taken, and he advises that plans and specifications prepared by an engineer belong, as chattels, to the client, after payment of the agreed fees; but the copyright in all original matter contained in such plans and specifications remains vested in the engineer. Neither the client nor any other person is entitled to multiply copies of plans and specifications so far as the original matter therein contained is concerned, and, further, if such original matter has "an artistic character or design" the plans can only be used for the purpose of the particular structure for which they were prepared by the engineer, or for such other purpose as he may authorise. Original matter in specifications is defined by counsel to be a composition or arrangement of the author—something which has grown up in his mind, and would, if applied to patent rights, be called invention.

* * *

School Building and the War.

The restrictions which have been imposed by the Treasury on borrowings by local authorities during the war, coupled with the present necessity for economising labour, are being felt in many directions. It is greatly to the credit of all concerned, however, that the inconvenience which necessarily results is being loyally and cheerfully borne as an incident of the exigencies of war. We have already referred to the two circulars on these subjects issued by the Local Government Board, and we now learn that the Board of Education has addressed to local education authorities a circular with regard to a temporary restriction of expenditure on the provision and improvement of school buildings. This circular contains some very useful suggestions in regard to administrative action which may be adopted by the authorities during the lull in the execution of structural works, with a view to the speedy resumption of school supply when the crisis is over. In the first place, each authority is invited to make a careful survey of the area under its control, with special reference to the supply of and demand for school places. Then again, where new or improved schools appear to be necessary, preliminary formalities can be completed, and plans can be submitted to the board. These will be considered and approved in the usual way, after consultation with the Local Government Board; but, of course, any estimates of cost submitted with them will necessarily be provisional, and the actual sanction of a loan by the Local Government Board will be deferred. Finally, as regards the acquisition of sites, where it appears that a suitable site may be lost or may rise in price if not secured at once it will be open to the local education authority, if the proposal is approved, to secure the site by means of a lease with an option of purchase.

Design of Quay Walls.

At the last meeting of the Concrete Institute a very interesting paper on "The Stability of Quay Walls on Earth Foundations" was read by Mr. F. E. Wentworth-Sheilds, M.INST.C.E. The peculiar difficulty in the design of these structures arises from the fact that, being necessarily founded as a general rule upon a soft material, they are always in danger of failure by a sliding forward of the whole work on its base. This circumstance, together with other inherent uncertainties, renders it exceedingly difficult to balance due safety with a proper economy of material. The object of Mr. Wentworth-Sheilds' paper was to consider the uncertainties and difficulties which the designer of a quay wall has to face, and, if possible, to ascertain how far calculations can assist him, and how far he must trust to judgment based on experience. The conclusion arrived at was that, although calculations cannot always be relied upon, they should not be entirely ignored. On the contrary they are most useful in suggesting means for increasing in the most economical manner the stability of designs which are known or suspected to be weak. The purely mathematical design is, however, impossible, and a sound judgment is therefore a matter of first-rate importance. How can such a judgment be formed? The engineer must, of course, rely primarily upon his own experience. In addition to this, Mr. Wentworth-Sheilds suggested that it would be most useful if careful records of both successes and failures in this class of structure could be kept and published. We agree that if the Concrete Institute could see their way clear to undertake this work, they would be rendering a real service to those engineers who have to design these specially difficult structures.

* * *

Risking a Surcharge.

Notwithstanding the refusal of the Local Government Board to give their sanction to a grant promised by the Maldens and Coombe Urban District Council towards the cost of a new rifle-range for the local volunteer training corps, the matter was further discussed at the last meeting of that body. One member urged that, in view of the excellent work accomplished by the corps, the council should make the grant in spite of the attitude adopted by the board. The whole discussion appears to have proceeded upon the assumption that if the grant were made, and the amount surcharged by the auditor, the loss would fall upon the council as a body. Those who have had practical, and perhaps bitter, experiences of surcharges, however, are aware of two things. In the first place the surcharge is made, not upon the council as a body, but upon the individual members who sign the cheque; while, in the second place, if the illegal payment is made wilfully and with knowledge of its illegality, the chances of a remission of the surcharge are comparatively small. After all, the council are the trustees of public monies raised for specific purposes, and the refusal to make a grant, even for so excellent an object, argues no lack of patriotism. What, asked one member, would a surcharge of a mere £25 be among a body of men such as constituted the council? We venture to suggest that all difficulties might be overcome, and the promise made by the council be redeemed, by raising the sum by voluntary subscription.

Urban and Rural Housing.

By REGINALD BROWN, M.INST.C.E., M.I.MECH.E., F.S.I., Engineer and Surveyor to the Southall-Norwood Urban District Council.

[On Monday evening further discussion took place on the two papers based on the report of the Land Inquiry Committee which Mr. R. Strachan Gardiner and Mr. C. S. Joseph read at a meeting of the Surveyors' Institution held on the 12th inst. Mr. Brown was among the speakers at Monday's meeting, and in the course of his remarks touched upon the essential points of the subjoined communication.]

No matter the source that gives rise to a discussion on housing, the subject is of such complexity and its consideration must be from so many points of view that there is room for all shades of opinion; but we, as an institution, have to look at the matter from its very broadest standpoint, and also from a constructive and not from a destructive point of view.

Mr. Joseph, in his paper on Urban Housing, summarises the main principles of the committee's report under three heads. First, he states that a large proportion of the population occupy overcrowded and insanitary dwellings, and the reason given is the scarcity of suitable accommodation at a reasonable cost. While all of us will probably agree that too many of the population occupy dwellings which, to say the least, are not ideal, much of the overcrowding and insanitation which exist are largely due to the occupiers themselves, and I am afraid it will always be so until the particular class occupying such dwellings have been educated to treat the houses they live in with the same care as they would do if they had to pay for all repairs and cleansing caused by their own negligence. There is too much at the present day of the shifting of responsibilities from the occupiers to the owners. The genuine working man and woman take a pride in their little home, and it seems very hard that these "will be's" should be compelled to live alongside the "won't be's."

I think that the London County Council and certain of the public utility societies have shown that decent accommodation can be provided at reasonable rents even in the more thickly populated parts of the Metropolis. The supply of such accommodation may not be equal to the demand, but the reasons why this is so should be tackled at the very roots, and not continue with aggressive legislation to make the supply still less than it is now. The Inquiry Committee concludes that three things militate against the supply being maintained, and I wish briefly to touch upon these three headings as set out by Mr. Joseph.

THE LACK OF HOUSES.

The first is the "high cost of land." One cannot help agreeing with the author that too much importance is attached to this item. I find that the London County Council, in their Parker-street House, Drury-lane, expended just under £11 per head for the site, while the cost of their Carrington House, Deptford, per head was about £2 15s., and that of Bruce House, Clare Market, about £12 10s. per head. To those who know, these prices bear a small proportion to the rental. Again, in the outlying urban districts, with twelve houses only per acre, and with the land at £600 per acre, the rent due to land is only 9d. per week, which sum is, of course, reduced if the number of houses per acre is increased, or the land lower in price; 1½d. per week per house per £100 per acre may be taken as a fair basis of calculation for twelve houses per acre.

The second reason given as militating against the supply of houses is rates. Now rates are, or should be, paid by everybody, and, what is more, each class of individual should bear an equal proportion. The poor-rate (made up of education, county council rates, police and poor relief—I am speaking of Extra London) and the district-rate put together, as paid by the lower-rated houses, do not at present cover the cost incurred on their behalf; hence it is difficult to see how these can be reduced. The constant upward tendency of rates ought to have serious consideration; but again it is necessary to go to the root, and not try to shift the rates, which ought to be paid by everybody, on to the shoulders of the few. Mr. Joseph has pointed out certain difficulties created by authorities refusing to "compound," but there is something to be said on both sides. Payment on full assessable value does not always mean that the total amount paid in rates would be less, although the rate in the £ might be less; or, again, where compounding is in existence the rates may be higher than in those districts where non-compounding is in force. It seems, then, that no rule can be laid down as applicable to or advisable for all districts.

We now come to the third reason—the local by-laws. To the minds of some people building by-laws are a bugbear; they are the cause of increased and unwarranted cost in building. Believe me, such a statement is not well founded, and I speak from a good many years' experience of their administration.

REMEDIES FOR SHORTAGE.

We next come to the remedies to be applied, and these may be summed up in—Building by local authorities; public utility societies to be assisted financially; promotion of transit schemes and improvement of existing property. I will only deal with the first two.

Why societies and not local authorities should be assisted financially I fail to see, and why, if financial assistance is to be afforded at all, it should not be afforded to everyone who complies with specific requirements. This principle has been followed in the Housing No. 2 Act so far as local authorities are concerned, by which they may receive a 10 per cent free grant under certain conditions; but why penalise private enterprise in this way? Private builders who cater for working-class houses are surely entitled to the same consideration—subject them to limited profits, if you like, and see that suitable houses are erected and maintained by them, but do not drive them out of the market by unfair competition. There is room for all private enterprise, public utility societies, and local authorities.

Now let me turn for a few moments to rural housing and Mr. Gardiner's paper. First, let me say that the suggestion of teaching hygiene in schools has, I think, the earnest approval of every person interested in housing. It is a suggestion which I, and many others, have advocated over and over again; but how to fit in such teaching in the ordinary school hours is one for the Education Department to settle. Some of the points raised by Mr. Gardiner are as follows: The shortage of houses to be made good, the housing of the poorest is the problem to be faced, the main difficulty being the cost. Private enterprise is prevented from building cottages because the labourer cannot pay an economic rent, and the suggestion that for the housing of the poorest the remedy is for either free grants or the raising of wages. Mr. President, I do not wish to labour the question more than is necessary, but I cannot forbear, with your permission, dealing with a solution of the housing problem put forward by me in 1913 at the conference of local authorities on housing, held at Yarmouth and many other places since that date.

THE FINANCIAL ASPECT.

The financial aspect of the question is the most important point for consideration, especially when it is borne in mind that no charges should fall on the general ratepayer, but that each scheme should in itself be self-supporting, so far as the district is concerned. In carrying out schemes I would suggest that definite maximum rents be provided for, and a maximum wage of 27s. per week in urban districts and 18s. in rural districts form a basis. The rent, calculated on the one-sixth basis, would then be 3s. in rural districts and in urban districts 4s. 6d. per week—the one-sixth basis being one day's pay to go in rent.

I start with the principle that some provision must be made for assistance to local authorities and others on behalf of those whose families require greater accommodation, as the larger the families the greater the accommodation required, and the less the bread-winner has to spend on house rent. How is this to be met, and how is the assistance to be afforded? One way in which the solution of the problem could be assisted would be the extension of the period of the whole of the loan to eighty years, instead of splitting it up into periods of

eight years for land, sixty for buildings, and forty in roads and sewers. This above would reduce the rent to about 8d per week and as the [illegible] could be carried out in good conditions, and the economies that already been made in the rents for such [illegible], it is difficult to see why this could not be carried out. I do not think it at all [illegible] and I am therefore not in agreement with Mr. Gardiner on this point. To do this would be a further penalty [illegible] and to [illegible] of private individuals. I have previously stated [illegible] part the gains [illegible] property.

From careful estimates of the cost of buildings [illegible] Government Board, and from which I am not at present prepared to depart, in normal times I am convinced that, with efficient administration and [illegible] rents. I estimate that with land at £100 per acre, with twelve houses per acre, and in urban districts, [illegible] families up to those of five children at rents varying from 4s. 10½d. to 7s. per week, and in rural districts under the same conditions, but with country gravel roads [illegible] per week. [illegible] per acre.

ACCOMMODATION.

As to the accommodation to be provided this depends upon the number of children at non-earning ages (say up to fourteen years), and I think all will agree that as the birth-rate is more a national than [illegible] Exchequer might well be asked to pay something towards what is a national [illegible] the children especially in the case of those who, owing to low-wage earning capacity, can afford but little out of their wages for rent. This principle has already been adopted in the case of those who within the [illegible] limit, where a rebate of £10 per annum (7s. 6d.) is allowed for each child under a certain age; so that the question is no new one. It is, of course, necessary to look at the question broadly and carefully, [illegible] come from somewhere. A simple solution would be [illegible] per week, to be paid direct to the local authority, or other bodies, or individuals erecting houses under specific conditions, and by them deducted from the rent to be charged, according to the accommodation provided in the houses erected by them and utilised. If such a system was adopted, it would mean that, taking the larger house referred to by me and fixing the rent at 7s. per week, and allowing that five children could be provided for, we get the rent payable by tenant, 4s. 6d.; National Exchequer, 2s. 6d.; total, 7s. and in the smaller house, on the same basis, with accommodation for one child, we get—paid by tenant, 4s. 4½d.; National Exchequer, 6d.; total, 4s. 10½d. Of course in the case [illegible] would have to be made that preference be given to those earning 27s. per week and under, the lowest paid and the largest families having the preference and also that if a person wished to occupy the larger type house, with, say, no children, then he should pay the whole 7s.; if one child, 6s. 6d.; if two children, 6s., and so on, with a minimum of 4s. 6d. per week, and the maximum number of children to be allowed for in the grant being five, the difference being made up by the National Exchequer. The same principle could apply to rural districts, where a cheaper [illegible] is required owing to the lower wages. Thus, taking my estimate of 4s. per week for the smaller type house, the Exchequer allowance would be 6d., leaving 3s. 6d. for the tenant; while for the larger house the Exchequer would pay 2s. 6d., leaving the tenant to pay 3s. 1d. per week.

By adopting such a method the grant from the National Exchequer to local authorities would be applied on an equitable basis. My suggestions, therefore, to facilitate the erection of houses for the working classes embody the following points for consideration

(1) Houses only to be erected, in the first instance, for those whose wages do not exceed 27s. per week.

(2) That preference be given, in letting the houses, to those receiving the lowest wages, and with the largest families.

(3) That proper regulations be made to ensure the full occupancy of the houses erected, or the tenant to pay rent according to the number of his family of non-earning ages.

(4) That the period of loan should be eighty years for land, houses and roads.

(5) That the National Exchequer should make grants to local authorities and others based on the number of non-earning-age children for which accommodation is provided and actually utilised.

I claim that by some such method as this houses could be erected so as to let at reasonable rents within the means of all workmen, and, in addition, some encouragement would be given for the increase of the birth-rate, and so delay the arrival of the period of racial bankruptcy—when the birth-rate is equal to, or below, the death-rate.

THE SOUTHALL-NORWOOD SCHEME.

In conclusion, I would like to give a few particulars of a scheme designed by me, and which would have been carried out if the war had not arisen.

I was instructed by the Southall-Norwood Urban District Council in 1914 to report upon sites for housing, and submit a scheme for their consideration, as they had received orders from the Local Government Board to proceed with a scheme owing to shortage of houses in the district. The detail of a good many sites were gone into, and at last it was decided to purchase a site of about 9 acres—a site admirably adapted for such a scheme, it being triangular in shape and bounded on two sides by parish roads. The land cost £500 per acre. My ideas on housing being to limit the number of houses per acre, I decided that ten houses per acre should be the number, and hence submitted a development showing ninety houses. My reasons for doing this were to limit the road-making charges to the lowest possible, and it may be interesting to know that a fuller development of the estate, while permitting a larger number of houses per acre, would have entailed charging higher rents to make the scheme self-supporting.

I am strongly of opinion that with careful development a low limitation of houses per acre does not in any way entail higher rents. In addition to this, the limitation of the number of houses has the very great advantage of securing more air space. I am not one of those and I am glad to see that Mr. Gardiner is in agreement with me- who believe that the whole of the vacant land on a building estate should be utilised as gardens for the separate houses, because it is not all the tenants who are keen on gardening, and one badly kept garden has a very deleterious effect upon adjoining gardens. I would rather see a small garden for the use of each house, divided by as few fences as possible, and those very low ones, and devote the remaining area as open spaces maintained by the authority out of the rates or let as allotments to those of the tenants who desire such accommodation.

It was [illegible] that my design was based, and for the information of the members the secretary has kindly hung certain of the drawings of the scheme on the walls of this hall. The block plan shows the scheme as a whole, with the space at the rear laid out as a public garden, and the spaces in front of the houses, built in quadrangular form, and also in front of one of the blocks were to be laid out in a similar manner. The scheme is arranged so that almost all the houses should overlook the open space at the rear, and have easy access thereto. It was decided to proceed, as a first instalment, with forty-two of the houses, together with twelve houses in another part of the district. The other plans exhibited show the accommodation to be provided in the various types. My estimate for building these fifty-four houses, with fencing, &c., amounted to £12,675. Some considerable delay was, however, unavoidably occasioned, and it was not until just before the war that tenders were invited for the work. These tenders, on my recommendation, were obtained on the basis of direct purchase of materials, and letting the labour by contract in the several trades, and it was of considerable satisfaction to me to find that, although the war had given rise to a large increase in the cost of certain of the building materials, the expenditure, even if carried out at such abnormal times, would have only been an average of £13 per house more than my estimate. As the increase in prices of materials accounted for at least £22 per house, it is obvious

that in normal times the estimate would have been a very fair one. The rents to be charged for the houses were as follows: Classes A and B, 6s. and 6s. 6d.; classes C and D, 7s. and 7s. 3d.; classes E and F, 7s. 6d. and 8s., the income balancing the expenditure. Unfortunately, owing to the war, the Local Government Board has stopped all such schemes, and hence the carrying out of the scheme has been postponed.

I must thank the members for their forbearance in permitting me to speak at such great length, but the subject is of such paramount importance that any suggestions made for solving the problem ought to receive due consideration.

HOUSING AND TOWN PLANNING.

LONDON COUNTY COUNCIL AND A PROPOSED CONFERENCE.

In a report submitted to the County Council on Tuesday the Building Acts Committee of that body stated that they had had under consideration a resolution of the council passed in December last that it be referred to the committee to report as to the advisability of the council calling a conference of the local authorities in the neighbourhood of London to discuss joint action in town planning under Part II. of the Housing, Town Planning, &c., Act, 1909. The committee reminded the council that the President of the Local Government Board had summoned six sectional conferences, each to consider the question of arterial roads and the relationship of these roads to town planning, so far as concerned the six sections into which for the purpose Greater London had been divided. One hundred and thirty-seven authorities in Greater London were represented at these conferences. The conferences had met and sub-committees had been appointed to collect information, but no definite decisions had been arrived at. The question of town planning was so intimately associated with the question of arterial roads that it appeared to them that no useful purpose would be served in calling a conference to discuss the question of town planning until some definite decisions had been arrived at with regard to the question of providing arterial roads, or at least until some further progress had been made in that direction.

The committee pointed out that there was also the financial aspect of the proposal to be considered. If the council were to call a conference, as suggested, it must be assumed that the council would be prepared to meet any expenditure which might have to be incurred in connection with any schemes for dealing with areas in London which might be put forward as the result of the conference. They believed, however, that the council did not wish at the present time to do anything in furtherance of schemes which might possibly involve them and other authorities in heavy expenditure, and they accordingly recommended that the reference of December last be discharged.

Surveyors' Institution. The Special Diploma examinations in sanitary science, forestry and surveying will not be held this year, the entries having been insufficient.

London District Surveyors. The Building Acts Committee of the London County Council report that they have consented, under sec. 142 of the London Building Act, 1894, to the appointment of a deputy district surveyor in four cases. They have appointed one interim district surveyor under sec. 139, and one special district surveyor under sec. 144.—The district surveyorship for the district of Greenwich and Woolwich became vacant on April 8th, by reason of the retirement of Mr. Alfred Conder. The gross receipts from the district during 1914 amounted to £1,658, of which the Greenwich portion of the district yielded £1,112, and the Woolwich portion £546. In view of the large receipts the Building Acts Committee have divided the district into two districts, the dividing line being the borough boundary. They will report in due course as to filling the vacancies, and in the meantime have appointed Mr. Conder interim district surveyor until the date upon which his successors will take up their duties.

ACCUMULATOR-PROPELLED VEHICLES.

"PHENOMENAL PROGRESS."

Mr. R. J. Mitchell, in a recent lecture before the Junior Institution of Engineers, said the progress which the petrol vehicle has made during the past fifteen years had obscured the fact that on the Continent of Europe, and more particularly in the United States, an immense advance in quite another line of commercial carrying had been made in the use of accumulator-propelled commercial vehicles.

In the States the growth of the electric type had been phenomenal, and the secretary of the Electric Vehicle Association reported that there were now in operation in the American Union nearly 75,000 accumulator-propelled vehicles.

Immense improvement had been made on the mechanical side during the past fifteen years, and the modern electric represented a high degree of refinement as regarded all its fundamental details. These improvements were largely due to the work of the regular automobile engineer, who had made available frames, axles, bearings, steering gear and transmission of unexampled excellence—in fact, of almost unimprovable durability. The electrical engineer, on the other hand, had contributed his quota, and accumulators, electric motors and controller, and so forth, were rapidly nearing perfection; in fact, it might be said that, for practicable purposes, the modern electric vehicle would remain an exceedingly useful machine were it not improved for the next twenty years.

The advantages of the electric were manifold, and included very low cost of operation, a safe speed, very slight damage to road surfaces, great handiness of operation, occupation of little floor space, total absence of fire risk, smoke and smell, and the fact that they could be driven by relatively unskilled labour, with a minimum of tuition.

Showing the economy of the electric from a fuel-consumption standpoint, it should be mentioned that an average machine would give the equivalent of 4 gross ton-miles of work for one unit input of energy. This compared exceedingly favourably with the 30 to 35 ton-miles of energy in commercial work obtainable from a gallon of petrol only on a very well tuned commercial petrol chassis.

The mechanical wear and tear of the electric was infinitesimal as compared with that of an internal combustion machine, and an average figure appeared to be about a quarter of 1 per cent per 1,000 miles of travel, on the initial capital cost of the chassis only.

High speeds in heavy traffic were much to be deprecated, for it should be borne in mind that not only did they cause the unnaturally rapid wearing out of the chassis, but also extensive damage to road surface, and at a rate probably in proportion to the square of the speed.

Tyres for electric vehicles had a specially long guarantee, and in actual practice far outlasted the terms of the warranty.

The modern accumulator had reached the point of being entirely dependable, and in the case of the Edison all-steel alkaline accumulator, a guarantee of four years, enabling the user to depend on at least 100,000 miles service, was available.

The price of electrical energy had come down from a figure sometimes as high as 1s. a unit to an average of 1½d., or thereabouts. Moreover, there were to-day nearly twice as many electricity supply undertakings, thus making it quite practicable to tour over the country on an accumulator automobile.

Drawing Office Requisites.—We have received a copy of the latest catalogue of Messrs. J. Halden & Co., Limited, 8 Albert-square, Manchester. The new list is much the most comprehensive the firm have issued. Many goods find space in it for the first time, and in a variety of ways information has been extended and amplified, while prices have in some cases been reduced. The catalogue is divided into five sections: (*a*) Drawing instruments; (*b*) surveying instruments; (*c*) drawing office sundries, (*d*) drawing office furniture; (*e*) engineering photography; and each of these section lists—which are as tastefully produced as the complete catalogue—is issued as a separate booklet for convenience of reference.

A WIGTOWNSHIRE FERRO-CONCRETE BRIDGE.

Mr. D. H. Robb, engineer to the Machars District [illegible] Wigtownshire, has designed a bridge [illegible] Mochrum Hill [illegible] Some time ago Mr. Robb found it necessary to report to the Wigtownshire County Council that the old Black Burn Bridge was unsafe for traffic in the Black Burn, in Wigtownshire.

Black Burn Bridge before Widening.

[illegible] of the heavy stone arch.

[illegible] struct the bridge, with the exception of the existing abutments and wing walls, as Mr. Robb came to the [illegible] paratively small weight of [illegible] the tender submitted by Messrs. [illegible] Limited, was accepted by [illegible] work was carried out under the supervision of and in accordance with the designs of the [illegible] working drawings were prepared by Messrs. L. G. Mouchel & Partners, of Westminster and Glasgow, who were represented during the execution of the contract by Mr. T. O. Dixon, their district engineer for Scotland.

With the object of consolidating the abutments, and of providing a solid monolithic support at each end for the ferro-concrete girders, the masonry was cut away so as to afford space for the [illegible] pad, 18 in. wide by 12 in. deep. The girder span comprises five ferro-concrete beams, 9 in. wide by 20 in. deep, connected by a continuous decking of the same material, 6 in. thick, the whole in monolithic connection. The two outer beams are continued up to form curbs for the roadway, and from them rise the ferro-concrete posts of the parapets on either side. The bridge, which has a clear span of 28 ft., allows a maximum opening for flood waters, and, while of unpretentious character, is perfectly harmonious with its picturesque surroundings.

Black Burn Bridge—View of Roadway.

Brass Pavement Rollers.—"M. A. C." asks for the names of makers of brass pavement rollers for cement work.

THE UPKEEP OF SURREY MAIN ROADS.

A [illegible] Committee of the Surrey County Council on the expenditure of the council, and have presented a report setting forth the following general conclusions [illegible]

As the result of careful consideration of the facts, your sub-committee have come to the following conclusions in reference to this branch of their inquiry:

(1) That, while motor traffic is still in a transition period, it has affected Surrey with severity.

(2) That the Road Board's figures, as given in their last report, issued in 1913, show that the weight of traffic at observation points [illegible] tionally heavy.

(3) That hard material for [illegible] be imported from other counties with heavy transit charges.

(4) That in Surrey the great arterial roads alone are main roads, so that the average cost per mile is higher than in counties where roads of less importance are included in the list of main roads.

(5) That the [illegible] throughout Surrey are kept generally in a satisfactory condition, and compare favourably with those in contiguous counties. The cost could probably be reduced, but this might involve a lowered standard of efficiency, which your sub-committee fear would not lead to efficient [illegible]

(6) That, in view of the Road Board's discontinuance of the grant of loans, it is a matter of satisfaction that the county council have not been committed, in reliance upon such loans, to the full capital expendi- [illegible] propounded by that board of carrying out extensive main road improvements.

Bridge Model at Royal Academy.—The model of a proposed new bridge across the Thames near St. Paul's Cathedral is to be seen at the Royal Academy Exhibition which opens at Burlington House on Monday. The model is from the drawings of Mr. C. Wontner Smith, and was placed fourth in the recent competition organised by the Bridge Committee of the City Corporation. The construction of this bridge at a cost of nearly £2,000,000 has been under consideration since 1909. The final design has not yet been accepted.

Corrosion of Iron and Steel.

DISCUSSION OF MR. W. J. E. BINNIE'S PAPER AT THE INSTITUTE OF SANITARY ENGINEERS.

We reproduced in last week's issue the valuable paper which Mr. W. J. E. Binnie, M.INST.C.E., F.G.S., presented at the meeting of the Institute of Sanitary Engineers held on the 14th inst. at Caxton Hall, Westminster. The reading of the paper was followed by an interesting discussion, for the subjoined report of which we are indebted to the courteous secretary of the institute, Mr. Hasluck.

Mr. H. Percy Boulnois (Westminster), past-president, in proposing a hearty vote of thanks to Mr. Binnie for his excellent paper, congratulated the institute on having secured Mr. Binnie as a Fellow, and for having had the opportunity of listening to his paper, which was a condensed explanation of a difficult and rather illusive subject. Mr. Boulnois was inclined to think there might be occasions in which, instead of going to the expense of treating water so as to prevent corrosion of mains, it might be more economical to occasionally scrape the mains with a machine. With regard to cast-iron pipes for sewage, he mentioned that the syphons into the docks at Liverpool had been in existence for upwards of eighty years, and were still perfectly sound, as a greasy film had coated them and thus protected them. As to remedial measures, he mentioned the Bower-Barff process, but concluded it could not be practically applied to pipes of large dimensions. He thought that some silicious coating on pipes might be found to solve the problem. He asked for some explanations of some of the terms used in the paper.

Sir William Ramsay, K.C.B. (hon. member), said that the "electrolytic theory" was merely a modern method of expressing the "acid theory" of erosion. The presence of acid is necessary to have the requisite concentration of hydrogen ions. Referring to the changes produced by water in motion, he threw out the suggestion that the attack might conceivably be due to difference in pressure, and therefore in concentration of the hydrogen ions of the water, due to its motion. The non-attack of sewage on iron was doubtless due to its alkalinity, which had the result of diminishing the number of hydrogen ions by combining them with the hydroxl ions of the alkali. He joined in congratulating Mr. Binnie on the very lucid expression of his subject, and especially on the fact that if the advice of those consulted had been taken a very great saving would have resulted.

Mr. H. F. Rutter, M.INST.C.E., said that he approached the subject of the discussion with some diffidence, as it was one of such great complexity that misconception might easily arise. Different conditions produced on the same material very discrepant results. It was quite clear that waterworks engineers were obliged, in some situations, to use steel pipes, as that was, for certain purposes, the only available material. He would, however, like the steel-pipe makers to understand that engineers were by no means satisfied with the durability of steel pipes as at present made, and that they used them because they had no alternative. Whether a solution of the problem would eventually be found in the direction of a perfect protective coating, or whether an incorrodible metal might hereafter be produced by alloying some other element with iron, he would not venture to predict. The extraordinary durability of cast-iron pipes had probably tended to cause engineers to hope for a longer life and more freedom from oxidation than steel pipes had up to the present afforded. Where the water conveyed was of a neutral character—as, for instance, in London—it became almost impossible to assign any limit to the life of large cast-iron mains. He had a year ago examined a 30-in. main laid in London in 1811, and found it both internally and externally in every respect as good as the day it was laid. The internal surface presented a black appearance, and was perfectly smooth except for a few scattered nodules, in no case more than ¼ in. in height. Thus the coefficient of friction was practically the same after 104 years' use as when the pipe was first laid. The pipes were, of course, made of cold-blast iron, and were not coated in any way. His experience seemed to show that the resistance to oxidation of cold-blast iron was superior to that of hot-blast iron. A contrasting instance might be quoted of a 21-in. steel pipe taken out of use owing to alterations a few years ago. This pipe had been used continuously for the conveyance of filtered London water for eighteen years. The whole internal surface was covered with nodular oxidation averaging, perhaps, ½ in. high, below each nodule there being a complementary pit. There was no evidence as to the material which had been used as a protective coating. Apart altogether from the reduced strength of the pipe due to the severe pitting, the increase in the coefficient of friction would have been very serious in any considerable length of main. At a very moderate estimate that coefficient must have been at least four times that of the pipe when new. About a month before the meeting he had occasion to open for examination some 42-in. steel pipes which had been used for fourteen years for the conveyance of raw Thames water through a tunnel beneath the river Thames. The internal surface of those pipes was entirely free from oxidation and perfectly smooth. The whole surface was coated to a depth of about ½ in., with a soft deposit which he took to be clay, the water conveyed containing small proportions of that material in suspension. It was of about the consistency of cream cheese, and could be readily brushed off. Apparently this coating had afforded complete protection against oxidation. The pipes had been given one coat of Siderosthen at the steel works and another after erection, but he was disposed to attach greater importance to the protective action of the deposit than to the coating, Siderosthen applied on the outside of the pipes, exposed to the damp air of the tunnel, having been found quite useless, and having to be brushed off and a special tar varnish substituted within a few months of its application. He could not venture to give the reason for the clay deposit clinging to the steel pipes while showing no disposition to adhere to the cast-iron pipes forming a part of the same main. He might mention that Siderosthen was a tar varnish the basis of which was the tar, which formed one of the by-products of oil-gas distillation. He feared that his remarks had not been very pregnant of suggestion, but trusted that the practical experiences given might possibly be of some interest.

Dr. Eric Rideal said that he considered the electrolytic theory of corrosion constituted a marked advance on the acid theory, since, although expressing potentially the same idea as that theory, it gave a greater insight into the actual mechanism of the process, and it was only by studying this mechanism carefully that practical solutions to the corrosion difficulty would be found. He suggested the following explanation of Heyn and Bauer's experiments of which Mr. Binnie had just given a *résumé*, and which Sir William Ramsey had referred to. On the electrolytic theory of corrosion, the action taking place could be divided into two entirely distinct processes—first, the liberation of hydrogen by the discharge of hydrions; and, secondly, the removal of the liberated hydrogen by means of an oxidiser, such as dissolved oxygen in the water. It appeared likely that the experiments of Heyn and Bauer indicated that the effect of increasing the velocity of the water was primarily to increase the rate of removal of hydrogen by bringing more oxygen in contact with the surface of the metal in unit time, and possibly also by actual mechanical means. After a certain critical velocity the equilibrium between the rate of formation of hydrogen and its rate of removal was reached, and since the rate of formation depended in this case practically only on the nature of the impurities in the iron and steel under investigation, it seemed clear that a further increase in the corrosion was not to be expected after reaching this critical point. He was very pleased that the exact conditions obtaining in the now famous Western Australian Goldfields pipe line had been published, since in actual practice the problem of dissolved oxygen had become an increasingly important one, in part due to the more frequent adoption of air lifts for water supplies. He had in his hand a corroded elbow, one of many taken from a hot-water system where the lifted water saturated with air had been discharged directly into the hot-water system. Under these conditions he had found that the oxygen liberated on heating the water had acted more especially on all the elbows and bends in the pipe where the gas could come in close contact with the metal. He welcomed Mr. Binnie's remarks on the deleterious effects of sea water, which were especially evident in the presence of air, as well as

where ashes and cinders were present. He had found that the practice adopted on the Flagler Railroad system, running from Key West, Fla., to Jacksonville, a part of which was continuously exposed to a salt spray, was well protected by a mixture of tar, cement, paraffin and rosin, provided that the mixture was made up with boiling tar. In tropical countries he had found that 4 parts of magnesium chloride per 100,000 in the water soon made its deleterious effects evident; as a preventative it had been found that zinc paints were more effective than red lead. He was glad that Mr. Binnie had referred to the Catskill aqueduct system of protection by Portland cement mortar, which was a process that he himself had frequently advocated. He could testify to the excellent results obtained in the New York scheme by this method, but it had to be remembered in this connection that the steel pipes had been well treated before lining with the cement. All the mill scale had been removed both by chipping, scraping and scrubbing with wire brushes, and finally the plates of the pipes had been washed with warm sulphuric acid before the final treatment. He rather deprecated the drawing of practical conclusions from experiments conducted with pure substances, such as electrolytic iron, distilled or air-free water, since the electrolytic theory had given the key to a method of practical testing with samples of the actual materials, such as cast iron, wrought iron, or steel, various "rust preventers," or paints, and water or soil with which the pipe was going to be placed in contact. He was more particularly alluding to the method of testing by applied E.M.F., which was practically a method of stimulating the natural effects to such an extent that but a few days need elapse to show the effects of years of the natural process. The results of the method, as far as he had tested it, made him inclined to be hopeful that finally the chemist could give to the engineer figures which, although relative, were actually of significance and value. He hoped soon that standard methods of electrolytic testing could be set up so as to ensure absolute uniformity in procedure all over the world.

Mr. Martin Deacon said he had listened with very great interest to the valuable paper which had just been read by his partner, and he would like to say a word on the subject of the treatment of pipes, whether of cast iron or steel, between the time of dipping or wrapping with hessian and the actual laying in position in the trench. He thought there is little doubt, where the ground in which a pipe is to be laid is of such a nature that some further treatment is required other than the actual dipping, such as wrapping with tarred hessian, that, providing the wrapping is properly done and judiciously handled after the treatment, the desired result will be attained. He thought for many reasons that greater efficiency would be obtained if it were practicable to wrap the hessian at the side of the trench just prior to laying, but the wrapping should be applied soon after dipping, while the bitumen coating is still just plastic, and this can only be done at the founder's works. After applying the wrapping in this manner and recoating to fill every interstice in the hessian, he found that it had adhered so tightly to the pipe that it was a physical impossibility to remove the hessian without actually chipping it off. It follows, therefore, that if the hessian is properly applied it will adhere to the pipe, and this can be done by applying it in a continuous spiral strip, always keeping the strip in tension and revolving the pipe on trunnions. He found on a recent visit to one of the foundries in this country that with the coating, whether simply a bitumen or both bitumen and hessian, the treatment of the pipes after the application was such as seriously to damage the coating. The pipes were rolled along rails to the trucks, which he believed is a common practice, with the result that the coating material was cut and damaged to such an extent as to render it of little value; the same treatment on the works still further damages the pipes, and though a local application may partially remedy the defects, it is nothing more than a patched job, not nearly so effective as the main and primary treatment. He thought that engineers should pay very careful attention to these mechanical defects, which are liable to be overlooked. They are small, but important, points which are frequently not dealt with in the specification. He thought that frequent visits to the foundry works during the process of production of the pipe and the application of the coating material is likely to be the means of the ultimate production of a specification which will deal with points otherwise liable to be neglected, the accumulation of which must materially affect the life of the pipe. If the sole inspection is left entirely in the hands of others, the tendency is for the inspector to become mechanical and be guided solely by the specification, such as it may be.

Mr. G. Bertram Kershaw (member of council) asked whether Mr. Binnie had met with corrosion in septic tanks in the presence of H_2S, due to the oxidation of the sulphur to free sulphuric acid by bacteria of the *desulphuricans* group. Corrosion, attributed to acid secretions of shellfish adhering to the piles, had occurred at a wharf in Hong Kong. The Bower-Barff process had been alluded to. He had some 10-in. pipes, 9 ft. long, treated by this process a few years ago, so that the capacity of the ovens must be fairly large. With regard to corrosive action being set up by contact of cinders or ashes with metal, it had been found at Boston, U.S.A., that a cast-iron pipe laid in the harbour in contact with coal had rapidly become very badly corroded, the sea water acting as an electrolyte. In a case which he was investigating, coal brought into contact with steel was again the cause of galvanic action being set up, corrosion resulting. He had heard of a case where in an estuary the fresh water lying on the salt, and coming into contact with iron, formed a voltaic pile, setting up corrosion. He would like to know, with reference to the Kalgoorlie case, what was the initial amount of oxygen in the raw water, and to what extent it was proposed to reduce it. He assumed the object of double coating the pipes was that by so doing minute pinholes in each coating would be extremely unlikely to become superimposed. Presumably, with a dose of only 3 grains of lime per gallon there would be little apprehension of decreased carrying capacity due to incrustation.

Mr. E. J. Fox (Stewart & Lloyds, Limited) said he thought engineers in general would be indebted to Mr. Binnie for having given a true account of the troubles experienced with the Coolgardie steel pipe line. Engineers without a knowledge of the actual facts had been inclined to blame these steel pipes, and it was well that Mr. Binnie, whose firm was professionally engaged in investigating the troubles, had now made it clear that the steel pipes—*per se*—were not responsible for the troubles. He believed where cast iron was used in connection with this pipe line—namely, for the reducing pieces, valves, &c.—that the corrosion was much more pronounced than it was in the case of the steel pipes. Those acquainted with the conditions were well aware that, had cast-iron pipes been used, not only would the cost of the scheme have been excessive, but almost certainly the corrosion in cast-iron pipes of the same size would have by this time so greatly increased the frictional resistance and consequent pumping costs on its 350 miles of length as to render its further operation impracticable. This view was fully confirmed by the experience in the water supply of Perth, Western Australia, which drew its water from the same source, and in which it had been found that a 12-in. cast-iron main had been reduced in capacity by about 75 per cent in five years by internal corrosion and incrustation, while a 21-in. wrought-steel pipe laid beside it had proved practically free from corrosion after eleven years' use. Mr. Rutter's long experience and use of cast-iron pipes perhaps not unnaturally prejudiced him in their favour; but the instances Mr. Rutter had cited that evening in favour of cast-iron pipes to the detriment of steel pipes could scarcely be called convincing. First, Mr. Rutter referred to a cast-iron pipe which had been in use for over 100 years, and had recently been found in first-class condition. Probably nobody knew better than Mr. Rutter himself that the cast iron of 100 years ago was not the cast iron of to-day, and therefore any comparison between cast-iron and steel pipes should be made between the commercial articles of to-day. Secondly, Mr. Rutter criticised a steel pipe which he had examined, and in which he had found internal incrustation to the depth of about ⅛ in. It was so generally accepted that cast-iron pipes encourage internal nodular growth to a far greater extent than did steel pipes, that the instance cited by Mr. Rutter could only leave the impression that if the pipe to which he referred had been cast iron instead of steel the internal nodular incrustation would have been far greater. Both cast-iron and steel pipes were subject to corrosion if corrosive influences were present, but it was interesting to note that, while in the case of cast iron the internal nodular incrustation often grew to a depth of 2 in to 3 in., in the case of steel it was limited to about

1 in., and while the depth to which corrosion would penetrate in the case of cast iron was about 2 in., this depth was limited, in the case of steel, to about ½ in. In conclusion, the relatively greater proportion of steel pipes used increased yearly, and as long as eight years ago the British Board of Census of Production for 1907 (published in 1909) gave the length of steel pipes bought annually as more than three times the length of cast-iron pipes.

Dr. J. Newton Friend wrote: In his paper Mr. Binnie has given a very interesting summary of the more important factors concerned in the corrosion and preservation of iron and steel. The treatment is, of necessity, brief, and therefore lends itself to almost unlimited discussion. One of the most important sections is that dealing with the relative corrodibilities of cast iron, wrought iron and steel, and, unfortunately, it is one upon which available information is scanty. The work of Thwaite, to which Mr. Binnie refers, was published about the year 1880, and is now of historical interest only. Since that date the methods of manufacturing both cast iron and steel have been completely revolutionised, and conclusions as to the relative corrodibilities of the metals manufactured thirty-five years ago are not logically applicable to those on the market to-day. The same applies, to a large proportion of the work published on the relative corrodibilities of wrought iron and steel, and further research on these interesting problems is urgently needed. At the same time it is impossible for any sweeping assertions as to the superiority of one class of iron over another from the point of view of corrodibility to be true. Recent research has conclusively proved that there are optimum conditions for each type of metal. Within the last two years Mr. C. W. Marshall and the writer have carried out a considerable number of experiments with a typical grey cast iron and a mild open-hearth steel. The results show that the cast iron was far more resistant to alternate wet and dry (*i.e.*, normal weather) conditions than steel. When completely immersed in water or salt solution there was little to choose between the metals, but when exposed to acid-corroding media the cast iron exhibited a very marked inferiority. If as the writer believes, the metals experimented with were truly representative, these results may be taken to apply to ordinary commercial grey cast iron and mild steel generally. It is interesting to note that published work indicates a similar oscillation in the relative corrodibilities of wrought iron and steel under the influence of varying corroding media. The present-day problem therefore resolves itself into the task, not of making sweeping generalisations, but rather of determining which metal is most suitable for any particular purpose. There is every reason why this should be accomplished by extensive experimental research and careful observation, but there is no other method by which the necessary information can be obtained. Furthermore—and this is a point frequently lost sight of—the problem must be attacked afresh whenever radical changes are made in the methods of producing the metals concerned.

Mr. Otto Hehner desired to join in the expression of appreciation of Mr. Binnie's papers. He had had a number of occasions, since he had the honour of collaborating with the late Mr. Deacon and Sir William Ramsay in investigating the causes of the corrosion of the Kalgoorlie main, to test the various theories referred to by Mr. Binnie, and all his further experience had convinced him that the electrolytic theory afforded a satisfactory solution. The character of the supplies which had a tendency of attacking iron was so various that it was not always easy to see the explanation. The electrolytic theory attributes the solvent power to the preponderance of hydrogen ions. Consequently water containing much calcium carbonate should not attack, yet it sometimes does attack. He had found that in at least one such case the development of beggiatoa organisms, which settled upon the pipes, was the cause. Most vegetable organisms developed acids, and these, in contact with iron, implied a local preponderance of hydrogen ions. Mustard and cress allowed to sprout on a polished marble slab etched the surface by dissolving the calcium carbonate. Most waters, however, which attacked iron contained but little carbonate. This was notably the case with the Derwent Valley water supply, which at the present time gave trouble in Nottingham and other Midland towns. This water, especially when hot, dissolved iron rapidly; but he had found that when its temporary hardness (which was only 0·4) was brought up to as little as 2 deg., it lost its solving power. This hardening—that is to say, the introduction of hydroxyl ions—could be readily effected in some cases by mixing a small proportion of the pre-Derwent supply. In connection with the same supply he had found that when hot it powerfully attacked galvanised pipes, a continual evolution of hydrogen being observable. A most minute trace of zinc hydroxide went into solution. As a consequence, Derwent water, which had first passed through a galvanised pipe, no longer attacked iron pipes. He was, however, of opinion that galvanised pipes in household use were undesirable, and afforded only an apparent protection from attack, the dissolved zinc being colourless—not being, therefore, apparent to the user, who would notice a very minute trace of iron rust. He had found considerable deposits of basic zinc carbonate in kitchen boilers and domestic hot-water pipes. A very interesting instance of attack had come under his notice a few years back in the case of a Kentish town supplied with water from the Tunbridge sands. This water had a temporary hardness of 8, and contained, when raised from the borehole, so considerable a quantity of ferrous carbonate that it had to be de-ironed before it could be supplied. For years the removal of the dissolved iron was effected by aërating the water by percolation through porous material. It then entered into the pipe system, and caused no trouble. Soon after the installation of an apparently improved de-ironing plant, consisting of closed vessels in which air was pumped through the water under pressure, and the precipitate of ferric hydroxide removed by filtration, also in closed vessels, the water delivered in the district became highly charged with iron, although on leaving the waterworks it was perfectly free from iron. On taking samples from the cast-iron mains, even at a distance of 4 or 5 miles from the works, no trace of iron could be found, but in the houses the water, both from the taps and particularly from the kitchen boilers, was laden with dissolved and suspended iron compounds. The pipes connecting the cast-iron main with the houses—which often stood a considerable distance away from the road—were of wrought iron; this was powerfully attacked. Now for the explanation: The water as raised from the well contained no less than 12·5 parts per 100,000 of carbon-dioxide—that is to say, had a preponderance of acidity, or hydrogen ions. In the original de-ironing treatment in the open air the carbon-dioxide almost wholly escaped into the air, the de-ironed water not having more than 1·1 part. The treatment in closed vessels did not in any way diminish the free carbonic acid, so that water with upwards of 12 parts of CO_2 and only 8 deg. of temporary hardness went into the main, and, of course, dissolved iron. This solution only takes place in presence of oxygen. Thus, when water saturated the carbon-dioxide, but free from oxygen, is allowed to filter through scrap iron no notable amount of iron passes into solution; but if at the same time air is blown through the scrap, water highly charged with ferrous carbonate issues. In water from which the dissolved gases have been pumped out a bright piece of steel can be kept indefinitely without showing the least tarnish. There are therefore two effective means of combating iron-solvent power—namely, the increase of hydroxyl ions, by the addition of basic materials like lime, calcium carbonate, or even hydroxyl of zinc, so that they preponderate over the hydrogen ions, or the removal of the oxygen, be it by pumping or by other means.

Mr. Binnie, in reply, expressed his thanks, particularly to those gentlemen who had taken part in the discussion. He felt that this discussion would greatly add to the value of the paper, seeing that those who contributed to it were such eminent authorities on the subject. He was very grateful to all those who took the trouble to attend, and especially Sir William Ramsay, whom they were all delighted to welcome there that evening. Now that he had become an honorary Fellow of the institute, the author felt sure that he was expressing the feelings of the other members in hoping that they would soon see him again. With regard to the remarks made by Sir William Ramsay, he was very much interested to hear his suggestion for depositing silicon in the interior of steel pipes, and he should like to see that tried. A process had been invented for protecting the surface of steel by means of granulated glass, and it was claimed that this gave practical immunity. The author had hitherto had no experience of this process, but was making certain investigations in connection with it. The author was glad to have his own personal experience with regard to the small amount of corrosion which took place

[illegible] Mr. Rutter's remarks were [illegible] blast iron resisted corrosion better than cast iron as made to-day. The difference in behaviour of the cast-iron and steel portions of the 42-in. main to which Mr. Rutter referred was difficult to explain. The steel pipes were coated internally with Siderosthen, which appeared to answer well for the inside of the pipe, but not for the outside, and he gathered that the cast-iron pipes were dipped in the ordinary way. The Birkenhead pipes were to receive a final internal coating of Siderosthen, and it was to be hoped that this would prove as effective as it was when applied to the 42-in. main referred to by Mr. Rutter. His firm had been led to adopt Siderosthen on account of the way in which it had protected iron railings exposed to moorland air for many years. The author was very much impressed with the explanation put forward by Dr. Eric Rideal to account for the difference [illegible] steel or cast iron was exposed to the action of still or moving water. It was difficult to account for the difference of behaviour of the two metals, but he was inclined to think that the general explanation put forward by Dr. Eric Rideal was correct. The importance of removing mill scale could not be over-estimated, and the author's firm were at present having an experiment carried out with a sand blast designed to effect this object. It was very desirable to have a reliable accelerated corrosion test, and to bring this about electrically was preferable to the use of dilute acids, as it was known that entirely different results were obtained when dilute sulphuric acid was used to accelerate corrosion than were found to take place under natural conditions. The author had read Dr. Eric Rideal's interesting paper contributed to the Society of Engineers, and hoped that he would pursue this branch of the subject to the advantage of the engineering profession. In reply to the points raised by Mr. Kershaw, the author had noted that, whereas iron placed at the bottom of a septic tank did not corrode rapidly, the reverse was true when the iron was at or near the surface in at least one case which had come under his notice. The amount of dissolved oxygen present in the Kalgoorlie water with which the experiments were carried out was normal —viz., about 6·5 c.c. per litre. This was reduced instantaneously to about 1·4 c.c. per litre when sprayed in the vacuum chamber. The vacuum amounted to ¾ in. of mercury, and, whereas a steel plate immersed in the ordinary Kalgoorlie water lost in weight 2·38 milligrammes per square centimetre in seven days, the loss over the same period when the plate was immersed in the water freed of its dissolved oxygen to the above extent only amounted to 0·15 milligrammes per square centimetre, the activity of corrosion being reduced to about one-sixteenth. Practically the same result was arrived at by adding 3 grains of caustic soda per gallon. Mr. Kershaw was correct in the explanation which he gave of the reason which led to the recommendation that the pipes should be dipped twice. The author was glad that Mr. Kershaw had raised the point with regard to the possibility of the lime reducing the carrying capacity of the pipe when added in excess quantities to the water, as this had taken place close to the point where the lime was added. The author believed, however, that the quantity of lime added to the water had been increased from 3 to 6 grains per gallon, but he was unable to state whether the deposit was the result of the increased dose. Mr. Bertram Blount raised the point that the dissolved oxygen could only be removed chemically, and this was no doubt true. When the water had been treated with ferrous sulphate and alkali, or when it had been charged with ferrous carbonate by filtering it after it had been carbonated through vessels containing metallic iron, the dissolved oxygen disappeared; but the cost of the process worked out at £7 13s. 4d. per 1,000,000 gallons, and was prohibitive. The milk of lime treatment reduced the attacks to one-sixteenth, and only cost 12s. 8d. per 1,000,000 gallons treated. The de-aëration effected the same amount of reduction and was recommended in conjunction with the lime treatment, and was estimated to cost slightly less than this treatment under the special conditions obtaining at the Mundaring reservoir, where the vacuum pumps could have been worked by the fall of the water from the reservoir to the pump-house. With regard to the statement made by Mr. Fox, that if cast iron had been used for the Coolgardie mains tuberculation would have been more pronounced, the author could not say whether this would have been so or not, but it would have been possible to scrape the main and keep it fairly clear of tuberculation if it had been cast iron; whereas it was impossible to scrape the steel main owing to the fact that if a fresh surface had been exposed for attack its strength would have become insufficient. With regard to the relative amount of tuberculation in steel and cast-iron mains, the author could not agree that tuberculation nodules never protruded to a greater extent than 1 in. in the inside of steel pipes, as in the case of the Coolgardie main they had been carefully measured and were found to exceed 1 in. over long lengths of main. The author was much indebted to Dr. J. Newton Friend, who had made this subject his own, for the interesting contribution which he was good enough to make in writing. The information given by Mr. Otto Hehner, with regard to the corrosive activity of the Derwent Valley water, and that derived from the Tunbridge sands, and the steps which were taken to overcome the difficulty was of great value. It was known that the water to be supplied to Birkenhead would be of very much the same character as the Derwent water, and arrangements were contemplated for the addition of lime after filtration in order to prevent, as far as possible, corrosive attacks on pipes.

GOVERNMENT HOUSING SCHEMES.

THE LONDON COUNTY COUNCIL'S POWERS.

[illegible] County Council report that they have had before them a proposal submitted by one of the principal architects to H.M. Commissioners of Works for laying out an estate in Woolwich and for the erection of a large number of houses for the accommodation of workmen employed at Woolwich Arsenal. The work is being executed under the powers conferred upon the Commissioners by the Housing Act, 1914. "We have," the committee state, "made several suggestions for alterations in the scheme, and we understand that the suggestions will be adopted. We are, however, informed that the commissioners hold the opinion that the London Building Acts do not apply to schemes carried out by the commissioners in London under the Housing Act, 1914. In view of the special circumstances which made the execution of the scheme a matter of extreme urgency, we have refrained from raising the question of the extent to which the London Building Acts apply to this particular scheme, but we have caused a letter to be sent to the commissioners informing them that the council cannot accept the view that the Building Acts do not apply to such schemes, and that the action taken in this particular instance must not be construed as in any way prejudicing the council with regard to the point should it hereafter be thought fit to raise it in relation to any similar scheme which may be put forward in future."

Asphalt and its Application in Sanitary Work.—Mr. H. Percy Boulnois, M.Inst.C.E., past president, will take the chair next Wednesday at a meeting of the Institute of Sanitary Engineers, at which Mr. Nandy Hoskins, chairman of council, will open a discussion on this subject. The meeting, which is to be held at Caxton Hall, Westminster, will commence at 8 p.m.

Government and Road Board Grants.—The County Councils Association on Wednesday adopted a resolution protesting against the requirement of the Treasury—to which reference is made in a "Minute" in this issue—that the Road Board should make it a condition of a grant towards the improvement of certain roads that they should be satisfied as to the adequate maintenance of other roads towards which they have made no grant. The resolution also expressed the opinion that the Road Board grant for 1915-16 towards the scheme previously sanctioned for the use of improved materials upon the more important main roads ought not to be largely reduced in order to relieve the Parliamentary votes for war purposes, at the cost of the Roads Improvement Fund, from the charge of remaking roads destroyed by military traffic.

Assistants' and Students' Section.

Conducted by SYDNEY G. TURNER, Assoc.M.Inst.C.E.

All communications in regard to this page must be addressed to The Editor, St. Bride's House, 24 Bride-lane, Fleet-street, E.C. *Envelopes must be marked "Assistants' Section" in the top left-hand corner. Correspondents are invited to submit questions for consideration and answers to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.*

QUESTIONS.

This week answers are invited to the following questions:—

474. Roof Truss. When one end of a steel roof truss is supported on roller bearings, what provision is made to counteract the movement and to prevent damage to the slates and timbers? How would any movement in the truss affect the roof covering? How much is a 50-ft. span roof likely to move? ("T-Square.")

475. Hydraulics. A pipe 5 in. in diameter delivers a certain quantity of water per minute with a loss of head of 4 ft. Determine the loss of head if the same quantity were delivered through a pipe 4 in. in diameter, assuming the same coefficient of friction.

476. Vectors.—State the essential properties of vector quantities, and distinguish between "vectors" and "scalars," giving two examples of each.

477. Levelling.—In a series of levels, if the first back sight read 3·25 on an ordnance bench mark of 28·30, the sum of the back sights be 12·95, and fore sights 17·20, what will be the ordnance reading of the last fore sight? (E. W. P., *Southampton.*)

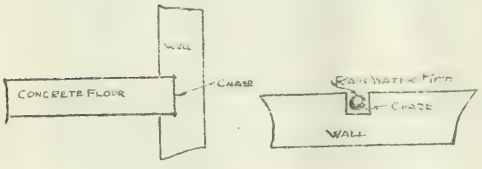
478. Levelling.—It is required to find the difference of level of two pegs on opposite banks of a river, and it is known that the collimation line of the level you have to use is out of adjustment. How would you find the difference of level required? (E. W. P., *Southampton.*)

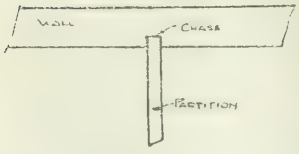
[The Editor is at all times glad to hear from readers who desire to submit questions regarding matters of general interest, points of daily practice, &c., for insertion in the "Assistants' and Students' Section." Questions which are published are taken into consideration, as well as other matter, in awarding the Monthly Premium.]

REPLIES TO QUESTIONS.

471. Building Construction.—What is a "chase"? Explain its function, and give sketches in illustration. (M. T. R., *Rhyl.*)

A chase is a vertical or horizontal recess, cut or groove-formed in a wall to receive pipes, &c. For small pipes, where the exact position is not known





when the wall is built, it will be found advisable to cut the chases at the time of fixing the pipes. Chases for partitions, floors, &c., whose position is known, are better if formed as the work proceeds. Chases may be formed for taking hot-water pipes in buildings, thus saving floor space. The illustrations show some of the uses that may be made of chases. (T. S. page.)

473. Retaining Wall.—Explain carefully the different ways in which a concrete retaining wall may fail, and state how such failures can be avoided. (M. T. R., *Rhyl.*)

The ways in which a concrete retaining wall may fail are as follows: (1) By overturning. The wall will overturn if the resultant line of thrust falls outside the base line, as in Fig. 1. The resultant thrust is obtained by combining the force due to the weight of the wall with the force due to the pressure of the material which the wall supports. We shall see below that failure from this cause is improbable. (2) If the intensity of stress induced by the resultant thrust on the earth supporting the foundations of the wall exceeds the safe bearing strength of the earth at the site in question, the wall will overturn. (3) The intensity of compressive stress in the concrete due to the resultant thrust should not exceed 20 tons per square foot, or the concrete may fail by crushing. (4) If the resultant line of thrust falls outside the middle third of the section, as in Fig. 4, tension in the concrete results. This is permissible, though not advisable, up to about 30 lb. per square inch, and the position of the line of thrust, as shown in Fig. 2, is the more satisfactory. It is evidently more probable that the wall will fail by tension in the concrete than by overturning, since the former can occur before the line of thrust passes outside the section, which is a necessary condition for overturning to ensue. (5) The wall may fail by sliding upon its base. Sliding will occur if the resultant line of thrust makes with the normal to the base line an angle greater than the friction angle, as in Fig. 3. We can now consider the methods by which the above-mentioned ways of failure may be avoided: (1) Overturning due to resultant line of thrust passing outside base. Should the method given below for avoiding tension and excessive compression in concrete be used, the wall cannot fail from cause (1). (2) Overturning due to insufficient bearing strength of the earth underneath foundations can be avoided by making the latter of sufficient area. (3) and (4) Consider 1 ft.-run of wall.

The intensities of stress due to weight of wall are—

$$\frac{W}{A} \pm \frac{W.a}{Z}$$

where W = weight of 1 ft. run of wall

A = area of 1 ft. run of base

a = distance between centre of base-line and point where line of action of W intersects base-line

Z = modulus of horizontal section and for 1 ft. run of wall

$$Z = \frac{I}{y} = \frac{\frac{b \times H^3}{12}}{\frac{H}{2}} = \frac{bH^2}{6} = \frac{H^2}{6} \text{ (since } b = 1\text{)}$$

The intensities of stress due to earth or water pressure are found by considering the wall as a cantilever fixed at its base. Therefore we have—

$$W.L. \times \frac{1}{y} \text{ of } Z = \frac{bH^3}{6} = \frac{H^3}{6} \text{ (since } b = 1\text{)}$$

where W = force tending to overturn wall

L = distance from point of application of W to base = H, if the material is earth or water

f = intensity of stress at base due to overturning force

$Z = \frac{H^2}{6}$ = modulus of section

In the case of water

Force tending to overturn wall = $\frac{1}{2}$ W H²

where W = weight of unit volume of water

and H = weight of wall

In the case of earth, assuming that there is no surcharge, Rankine's formula is

$$P = \frac{1}{2} W H \left(\frac{1 - \sin a}{1 + \sin a} \right)$$

where W = weight of unit volume of earth,
H = height of wall,
a = angle of repose of earth.

The above formula is seldom, in practice, used, as it is assumed that the resultant pressure is not exerted, but also

It is obvious that the statement made is incorrect. For, let the intensity of stress at one side of base be zero.

Then $\frac{W}{A} = \frac{W}{Z}$

$$\frac{I}{A} = \frac{\frac{bd^3}{12}}{\frac{b}{d}} = \frac{d}{6}$$

... the resultant line of thrust is within the middle third. If, therefore, this limit be passed, the concrete is stressed in tension. Take a similar example (see Fig. 1). A concrete wall 24 ft. ... ft. wide at the base and 6 ft. wide at the top, retains earth to its full height. Test the wall for stability, assuming that the concrete weighs 120 lb. per cubic foot, the earth 112 lb. per cubic foot, that the angle of repose is 30 deg., and that there is no surcharge.

... the intensities of stress due to weight of wall, we have—

Weight of 1 ft. run $= \frac{24}{2} (6 + 8) 120 = 20160$ lb.

We find from the figure that $x = 8$ in.

$$P = \frac{W}{A} \pm \frac{W x}{Z}$$

$$= \frac{20160}{8} \pm \frac{20160 \times \frac{2}{3}}{\frac{8 \times 8}{6}}$$

$$= 2520 \pm 1260$$

= 3780 lb. per sq. ft. compression at B,
and 1260 ,, ,, ,, ,, A.

... the intensities of stress due to weight of earth we have—

Weight of earth pressure upon 1 ft. run ... $\times 112 = 24$...

$$\left(\frac{1 - \sin}{1 + \sin} \right) = 10752 \text{ lb.}$$

$$\text{W.L.} = \frac{bd^2}{6}$$

$$10752 \times 8 = \frac{8 \times 8}{6}$$

$$= \frac{6 \times 8 \times 10752}{8 \times 8}$$ ... sought per sq. ft. ... at A and ... at B

The nett intensities therefore are—

(a) At A 1260 + 864 = 9924 lb. per sq. ft. compression.
(b) At B 3780 − 864 = 1284 ,, ,, ,, ,,
= 24 ,, ,, ,, ,,

The latter is within the safe limits of tension for concrete, but many engineers would prefer to thicken the wall, and thus bring the resultant line of thrust within the middle third. In designing retaining walls for water the following graphic method is useful: The width of wall at base may be made ... resultant ... height, and ... side

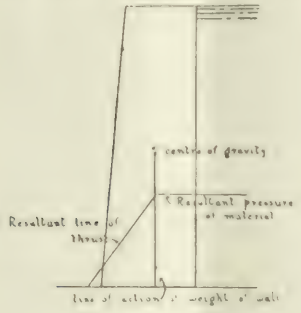


Fig. 1.

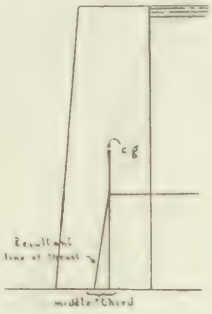

Fig. 2.

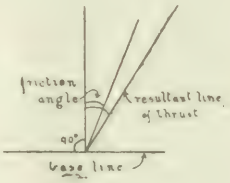

Fig. 3.

Fig. 4.

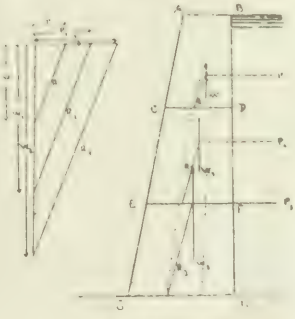

Fig. 5.

Fig. 6.

... battered to 1 in 12, the wall being then tested for ... as follows. Divide the wall into sections as shown in Fig. 5, and find the positions of the ... of gravity of the figures ABCD, ABEE and ABGH. Next find the weights of these sections, and mark them off on a scale line, as in figure. Find the water pressure on BD, BF and BH, and mark off in a similar manner; then from these we can find the resultants R_1, R_2 and R_3 of the forces W and F, W and P, W and P respectively. Draw on the section the lines of action of the above forces, adding the resultants, as shown in figure. The dotted lines indicate the outlines of the middle third of the section, and should the resultants fall within these lines the design may be considered as satisfactory. An interesting case is that of a wall triangular in section. Suppose the dam to be empty. The resultant line of thrust then passes through the extremity of the middle third of the section. If now the sloping side of the wall should happen to be subject to wind pressure, the intensity of stress at the windward side of the base changes from zero to tension, and provision should be made for this

in the design. (6) Should it be suspected that, owing to the character of the soil under the wall, or from any other cause, sliding is likely to ensue, it is best to arrange the base as shown in Fig. 6, thus ensuring that the resultant line of thrust does not make with the normal to AB an angle greater than the friction angle of the surfaces in contact.

To sum up, the stability of a concrete retaining wall depends upon the nature of the subsoil, the design of the base, and the position of the resultant line of thrust. (B. K., *Newport, Mon.*)

EURIPIDES.

DESIGN OF THE MADRAS CITY WATERWORKS.

To the Editor of THE SURVEYOR.

SIR,—In the issue of your journal dated January 22, 1915, there appeared a description of the new works connected with the Madras city water supply. The claim made therein that Mr. J. W. Madeley, special engineer to the Corporation of Madras, was responsible for the entire design and construction of the works is absolutely unwarranted. The entire scheme for the improvement of the water supply of Madras, including its distribution in the city, was prepared by me, and the vitally important portion of the scheme—namely, that relating to the conveyance of the supply from its source to the city, its filtration and elevation—was prepared by me, and was accepted by the corporation and sanctioned by the Government of Madras some time before Mr. Madeley set his foot on Indian soil.

My scheme was the first complete scheme ever prepared for the improvement of the Madras waterworks. The scheme possessed a wealth of detail never attempted in any of its forerunners, of which there were not a few. In forwarding the scheme to Government, Mr. W. Hutton, ASSOC.M.INST.C.E., sanitary engineer to Government, remarked: "I think Mr. Nowroji is to be congratulated on the careful manner in which the work has been done, and the exhaustive character of the report describing the work. The scheme has been drawn out on sound principles, which, if carried out in Madras, will give the city what is of first importance to any town—viz., a pure and wholesome supply of water—delivered into houses uncontaminated and at a sufficient pressure." The Sanitary Commissioner said that the scheme had his entire approval, and the Sanitary Board, of which the chief engineer, Public Works Department, is the president, and the Surgeon-General a member, "unhesitatingly recommended its adoption and execution." The chief engineer who scrutinised the engineering details of the scheme stated that there was nothing to urge against the principles of the scheme, which were sound. He, however, made a few alterations in engineering details, such as strengthening the section of the conduit where it was subjected to extra earth and water pressure. He also recommended that the elevated iron tank should be larger. These alterations raised my estimate of Rs.22.5 lakhs to Rs.23.6 lakhs. Thus, slightly modified, it was finally accepted by the corporation and sanctioned by Government for execution. The Government were also graciously pleased to offer my services to the corporation to carry out the scheme I had designed, a proposal which was cordially welcomed by the commissioners. Unfortunately, at this juncture certain grave questions as regards the design and execution of the drainage works, on which some 30 lakhs had already been spent, arose. It was alleged that many lakhs spent on these works were money wasted. The commissioners, however, did not acquiesce in what they described as a sweeping condemnation of the works, and asserted that things were not as bad as they had been represented. They, however, admitted that the matter was sufficiently serious to call for a halt in the execution of the works and to subject them to a careful scrutiny, with the view of rectifying defects and avoiding them in the future. In this dilemma Government proposed, and the corporation, after demurring to it more than once, agreed to obtain an expert in municipal engineering from England on a salary equivalent to that of the chief engineer of a province. It was quite in the fitness of things that, having decided to obtain an engineer presumably of high attainments, commensurate with his salary, primarily for the drainage works, he should also be given the control of the execution of the waterworks. The corporation, however, consistently held to the opinion that it would be advantageous to employ me on the execution of the waterworks since I had designed it. So, when the special engineer arrived, the corporation passed a resolution requesting Government to place my services at their disposal for the execution of the waterworks under the supervision of the special engineer.

In the meantime I was deputed again to prepare the second part of the improvement scheme—i.e., the extension and enlargement of the distribution system. My estimate for improving the distribution system amounted to Rs.14.5 lakhs, in addition to the 23.6 lakhs for the main part of the scheme, referred to above. It thus happens that the entire project, as now completed, or rather approaching completion, was originally designed by me.

The question may rightly be asked, how far was my original scheme adhered to in its accomplishment. As the executive officer in charge of the works I constructed the first part of the scheme, including the roughing filter, 7 miles of conduit, and filters covering an area of 7 acres, three large covered reservoirs for storing filtered water, the suction well, and foundations to engine-house up to basement level. These works form the most important portion of the scheme and most difficult of execution, being all underground, some 22 ft. below the surface in heavily water-logged soil. With the exception of the last-mentioned item of work they were all constructed and are identically as designed by me. I have also designed and supervised the construction of some smaller waterworks in this Presidency, and I say without fear of contradiction that the works referred to above were carried out with less deviations from the original design than is usually the case with works of such magnitude and intricate details. I may also claim that of these alterations, which all relate to details of construction, a very substantial number emanated from me. Alterations are inevitable in the construction of all works, large or small, more in the larger works than in the smaller ones. Such alterations become necessary owing to the revealment of unforeseen circumstances and conditions, as also to the fact that during construction the engineer has more time to consider details than during the preparation of the scheme.

Of the component parts of the main scheme the engine-house and the elevated tank were redesigned by Mr. Madeley. The necessity for redesigning the engine-house was fully anticipated by me. In paragraph 122 of my report I said: "The plan of the engine-house is merely suggestive of the architectural character of the building. Its second purpose was to approximate the cost of the engine-house as near as possible. It would be redesigned to the dimensions considered necessary by the successful tenderer for the pumping plant." When I designed the scheme the rival claims of oil, steam and electric power for driving the pumping engines were vigorously urged by those partial to or interested in the supply of electric power or the manufacture of oil and steam engines. Engineers who have designed and executed waterworks know that the design of an engine-house depends upon the pumping plant finally adopted. It depends not only on the motive power, but also on the type and make of the pumps. It is, however, a significant fact that the pumping plant actually installed is of the very type recommended by me after fully discussing the economic merits of various classes and types of pumping plants; for, after all, the crucial test of a pumping plant is the working cost of a given amount of work. I provided triple-expansion surface-condensing engines, with Babcock & Wilcox boilers, superheaters, and Green's economisers. The other work redesigned by Mr. Madeley was the elevated iron tank. I have already stated the reason for redesigning. The chief engineer had recommended a tank lower than the one designed by me. In the redesign all the main principles and features of my design were incorporated. These were a foundation consisting of a monolithic mass of concrete covering the whole area occupied by the tank, and not merely under the supporting walls and pillars, a peculiarity of design now adopted wherever a heavy foundation is necessary, as in tall buildings of the sky-scraper type; a masonry plinth or tower to support the iron tank; a ferro-concrete floor; and a limit of 25 ft. for the maximum depth of the iron tank. All these cardinal principles and features of my design have been reproduced by Mr. Madeley in his redesign.

As regards the distribution system, though there is

considerable difference in the alignment of the new pipes and in other matters, in their general principles the original scheme and Mr. Madeley's revised scheme are very similar. In its broad outline my scheme provided for a population of 600,000, with an allowance of 25 gallons per head per day. The minimum size of pipes main was fixed at 6 in. The pipe system was strengthened by providing new pipe lines to Tondiarpet and Mylapore, the extreme northern and southern districts of Madras, where the supply at present is scanty and defective. All dead ends were abolished, and pipe routes were so arranged as to prevent any interruption of supply in the event of a burst in any main. Scour valves and air valves were included. The taps provided were of Tylor's self-closing type, which I claim to have introduced, if not in India, certainly in the Madras Presidency after one of my visits to England, when one of the proprietors of the firm demonstrated to me at his works the utility of the tap. The sizes of pipes were calculated by Kutter's formula, with a coefficient of 0·013 for a maximum delivery of the day's supply in twelve hours. Without exception, all the principles enumerated above, and all the main features of my scheme were adopted and reproduced in Mr. Madeley's revised distribution scheme. Where Mr. Madeley diverged from my scheme was in the alignment of the lines for augmenting the supply to Tondiarpet and Mylapore, and in the provision of a little extra pressure and more numerous branch lines than I had.

Thus the portion of the work which is most important from an engineering point of view, and in the construction of which more difficulties were encountered than in the rest of it, has been executed identically as designed by me, and the rest of the work—namely, the engine-house, elevated iron tank, and the distribution system—were redesigned by Mr. Madeley, embodying all the essential principles and features of my original scheme. There is therefore no justification whatever for the statement that Mr. Madeley was wholly responsible for the design of the works.

Two years ago, when Government ordered my reversion to my permanent post, the commissioners of the corporation held a special meeting to request Government to permit the retention of my services in the corporation until the completion of the waterworks. The Hon. Dr. T. M. Nair, who moved the resolution to that effect, recounted my *rôle* in the design and execution of the works. In the course of a long and convincing speech, marked by consummate ability, he [illegible] Chetpet Service Reservoir and Pumping Station, and the Kilpauk Service Reservoir and Pumping Station, and the Kilpauk Service Reservoir and Pumping Station, and the Kilpauk

Institution of Municipal and County Engineers.

COUNCIL MEETING.

A meeting of the council of the Institution of Municipal and County Engineers was held at 92 Victoria-street, Westminster, S.W., on April 17th, those present being Messrs. J. S. Pickering (president, in the chair), J. Patten Barber, W. Nisbet Blain, H. P. Boulnois, J. A. Brodie, J. S. Brodie, Chas. Brownridge, G. F. Carter, J. W. Cockrill, A. E. Collins, E. J. Elford, Frank Harris, T. W. A. Hayward, W. T. Lancashire, E. B. Martin, Frank Massie, P. H. Palmer, Norman Scorgie, Allan Stevenson, R. J. Thomas, H. T. Wakelam, C. F. Wike, O. E. Winter, the consultant secretary, and the secretary. Apologies for absence were received from Messrs. A. D. Greatorex, E. P. Hooley, L. S. McKenzie, G. A. Phillips, and H. E. Stilgoe.

THE MEMBERSHIP ROLL.

The following candidates were elected:—

Members: Messrs. P. A. Benn, city surveyor, Lichfield; G. R. Collinson, deputy borough engineer, Swansea; D. M. Davies, engineer to the Neath Rural District Council; J. B. Fallowfield, surveyor to the Church Urban District Council; A. Pike, town engineer and surveyor, Volksrust Municipality; H. Taylor, deputy borough engineer, Barnsley; H. Taylor, deputy borough engineer and surveyor, Luton; and R. A. Webb, senior assistant engineer, Lagos Municipal Board, Nigeria.

Associate Members: Messrs. R. A. Gandy, assistant to borough engineer, Bedford; and M. Sabry, engineering assistant to Leeds sewerage department.

Students: Messrs. E. H. Elgar, engineer's office, Walthamstow Urban District Council; E. A. Lister, borough engineer's office, Bridlington; and W. Muir-Smith, borough engineer's office, Eastbourne.

Transfer from Associate Member to Member: Mr. G. E. Jarman, municipal engineer, Amritsar, India.

LETTERS OF CONDOLENCE.

It was resolved to express the sympathy of the council with the families of the late Prof. Henry Robinson and Mr. W. Dyack in their bereavement.

CITY OF LONDON NATIONAL GUARD VOLUNTEER CORPS.

It was resolved to nominate Captain W. H. Prescott as the representative from this institution on the committee of the above-mentioned corps.

PROTECTION OF ANCIENT BUILDINGS.

A letter was received from the Society for the Protection of Ancient Buildings as follows:—

"I am desired by my committee to approach your institution on the subject of the repair and extension of ancient buildings in the care of the municipal and county surveyors.

"Cases have lately occurred when the society has learned too late that works of repair have been undertaken with results that the lovers of ancient buildings deplore, and this, not through lack of appreciation of their value on the part of the city and county councils, but because, not having had a large experience in this special branch of their work, the surveyors had not known where to get the appropriate materials for the work nor the best means of employing these.

"My society wishes me to place its services, as a consulting body, at the disposal of all surveyors who have at any time to consider these proposals, and it does this hoping that this offer will be appreciated as an example of this society's wish to help in the difficult matter.

"The society does not wish to force its views unasked or unwanted on all the local authorities, as it realises that in this matter, as in all others, freedom of individual thought is necessary if good results are to follow. The society is, however, strongly of opinion that friendly discussion of various cases can be followed by nothing but good.

"The terms on which this offer is made are as follows:—

"The society will consider any proposals which come before it free of cost, and it will, if desired, obtain and consider a report on any building at a nominal cost to cover the expenses in connection with the work involved.

"The society approaches your influential institution with this offer believing that it will be welcomed by you, and that the exchange of ideas, either privately or at the public direction of the local authorities, will prove of use to those concerned in the upkeep of the ancient monuments of the past.

"I am further desired to inform your institution that this society would welcome the opportunity to arrange for a paper to be read before your members at one of your ordinary meetings on this interesting and important subject."

It was resolved to welcome the invitation to co-operate with the society and to arrange for a paper on Protection of Ancient Buildings to be read at the forthcoming annual general meeting.

ELECTRIC VEHICLE COMMITTEE.

A letter was received from the Electric Vehicle Committee of the Incorporated Municipal Electrical Association inviting the nomination of a representative. It was resolved to nominate Mr. A. E. Collins as a representative from this institution.

STANDARD SPECIFICATION FOR SALT-GLAZED WARE PIPES.

Draft clauses for insertion in the Standard Specification for Stoneware Pipes dealing with the thickness of stoneware on spigot ends and the sockets were submitted by Mr. E. J. Elford, and after discussion it was resolved to forward them to the Sectional Committee of the Engineering Standards Committee on Salt-glazed Ware Pipes.

PREMIUM SCHEME, 1915-16.

It was resolved that the premium scheme for the year commencing May 1, 1915, should be similar to that for 1914-15—viz., three prizes of £5 5s., £4 4s., and £3 3s. respectively, for the three best original papers read at a meeting in connection with the institution, or published in the *Journal*, the council reserving the right to withhold all or any one of the prizes in the event of no paper of sufficient merit being presented.

ELECTION OF DISTRICT OFFICERS, 1915-16.

The report of the returning officer and scrutineers as to the scrutiny of the nomination papers and ballot lists for the election of district officers for the year 1915-16 was received. The result of the election was as follows:—

Metropolitan District.—District chairman, G. W. Humphreys (London County Council); district representatives, P. Dodd (Wandsworth), O. E. Winter (Hampstead); district secretary, Norman Scorgie (Hackney).

North Wales District.—District chairman: J. P. Evans (Wrexham); district representative, W. Jones (Colwyn Bay); district secretary, J. England (Wrexham).

West Midland District.—District chairman, A. T. Davis (Shropshire); district representative, F. C. Cook (Nuneaton); district secretary, F. C. Cook (Nuneaton).

Southern District.—District chairman, R. Read (Gloucester); district representative, L. S. McKenzie (Bristol); district secretary, F. R. Phipps (Basingstoke).

Irish District.—Vice-president, J. W. Leebody (Co. Tyrone)*; district chairman, H. F. Gullan (Belfast)*; district representative, R. H. Dorman (Armagh)*; district secretary, M. Sellars (Dundalk).*

East Midland District.—District chairman, F. G. Mawbey (Leicester); district representative, W. B. Purser (Kesteven County Council); district secretary, E. H. Crump (Hinckley).

South Western District.—District chairman, James Paton (Plymouth); district representative, T. Moulding (Exeter); district secretary, D. Edwards (Taunton).

South Wales District.—District chairman, W. Harpur (Cardiff); district representative, G. A. Phillips (Glamorganshire); district secretary, H. Alex. Clarke (Briton Ferry).

North-Eastern District.—District chairman, J. P. Wakeford (Wakefield); district representatives, L. Roseveare (South Shields), W. J. Steele (Newcastle-on-Tyne); district secretary, F. O. Kirby (Doncaster).

Scottish District.—Vice-president, Allan Stevenson (Ayrshire); district chairman, J. Young (Ayr); district

representative, T. Nisbet Glasgow), district secretary, D. V. Donald (Grangemouth).

South-Eastern District. District chairman, A. Dr[illegible] and (Surrey), district representative, H. W. Bowen (West Sussex), district secretary, J. L. Redman (Gillingham).

Dublin District. District chairman, H. J. Wakelam (Middlesex), district representatives, J. A. Webb (Hendon), E. Wilks (Norwich), district secretary, H. Collins (Colchester).

North Wales District. District chairman, J. S. Brodie (Blackpool), district representatives, W. Stubbs (Blackburn), A. W. Brodie, (St. Helens), district secretary, A. W. Bradley (St. Helens).

Indian District. District chairman, L. P. Marshall (Durgaon), district secretary, A. F. Henderson (Chittagong).

African District. District chairman, W. Dickson (Johannesburg), district secretary, T. W. Smithorpe (Pretoria).

BOARD OF EXAMINERS.

It was resolved to add the name of Mr. [illegible] Wilson on the list of the Board of Examiners.

MUNICIPAL AND COUNTY CLUB.

It was resolved to accept the offer of the Municipal and County Club during the annual general meeting, and to offer the thanks of the council for the club's kindness.

BADGE FOR VICE-PRESIDENTS.

A suggestion was received from the South-Eastern District for the provision of a badge for Vice-presidents, and it was resolved to refer the matter to the General Purposes Committee for discussion and report.

CHARLES JONES MEMORIAL FUND.

It was reported that a replica of the portrait of the late Mr. Charles Jones in the Ealing Town Hall could be obtained for the amount subscribed, and it was resolved, therefore, to purchase such a replica to be hung in the council chamber of the institution.

DEPARTMENTAL COMMITTEE.

A resolution was received from the Eastern District suggesting that the attention of all the districts should be drawn to the appointment of departmental committees to deal with matters affecting municipal and county engineers, so that each district should have an opportunity of reporting to the council on the matter. The suggestion was considered very valuable, and it was resolved to carry it out. It was resolved that such discussions should not be open to the Press or be published.

PERIOD FOR BALLOT.

A letter [the full text of which was given in last week's SURVEYOR] was received from the hon. district secretary for the African District drawing attention to the impossibility of South African members returning ballot papers within the period prescribed by the by-laws. The council decided to point out that any alteration in the period would have to take into consideration the maximum time occupied in transmission to and from the most distant members all over the world, which would involve a very great extension of the time allowed for the ballot.

SPECIAL COUNCIL MEETING.

A special meeting of the council, to discuss the question of heavy traffic and to nominate witnesses to appear before the Departmental Committee, was held at 92 Victoria street, Westminster, S.W., on April 17th. Mr. J. S. Pickering, president, occupied the chair, and there were present Messrs. J. Patten Barber, W. Nisbet Blair, H. P. Boulnois, J. A. Brodie, J. S. Brodie, Chas. Brownridge, G. F. Carter, J. W. Cockrill, A. E. Collins, E. J. Elford, Frank Harris, T. W. A. Hayward, W. T. Lancashire, E. B. Martin, Frank Massie, Norman Scorgie, Allan Stevenson, R. J. Thomas, H. T. Wakelam, C. F. Wike, O. E. Winter, the consultant secretary, and the secretary.

NOMINATION OF WITNESSES.

It was resolved to nominate Messrs. W. Nisbet Blair, J. A. Brodie, A. E. Collins, J. S. Pickering, R. J. Thomas and H. T. Wakelam as witnesses to appear before the Departmental Committee with power to add to their number.

In order that no aspect of the subject should be overlooked, it was resolved to invite each hon. district secretary to ascertain the opinions of the members in his district, and to forward them to the [illegible] not later than May 22, 1915.

ROAD CONFERENCE June 24th to 26th.

In connection with the [illegible] the secretary announced that on the occasion of the forthcoming annual general meeting of the institution it has been decided to hold a road conference in conjunction with the Road Congress and Exhibition arranged by the County Councils Association, and that representatives of authorities attending the congress and exhibition are, Mr. Robinson states, cordially invited to be present at the conference. Previous conferences, he adds, have proved so successful, and the papers and discussions of such value in the elucidation of the problems of road [illegible] and administration, that, in view of the great and increasing importance of such matters, it is hoped that full advantage will be taken by authorities of this invitation.

The following is a preliminary list of the papers to be read and [illegible] at the conference:—

"The Improvement and Maintenance of Highways in connection with Modern Traffic Conditions," by C. F. Gettings, county surveyor, Worcestershire.

"Improvement and Maintenance of Highways," by J. S. Brodie, M.INST.C.E., borough engineer, Blackpool.

"Some Recent Experiences in the Surfacing and Maintenance of Roads, particularly on a Clay Subsoil," by J. A. Webb, surveyor, Hendon Rural District Council.

"[illegible] Haulage of Materials on the Highway," by F. W. Smart, chief engineering assistant, Bedfordshire.

"Mechanical Traction for Municipal Work," by E. J. Elford, borough surveyor, Southend-on-Sea.

"Haulage by Mechanical Means *v.* Horse Power," by J. Rush Dixon, M.INST.C.E., borough engineer, Wakefield.

"Haulage by Mechanical Means," by T. W. E. Higgens, ASSOC.M.INST.C.E., borough engineer, Chelsea.

"Reinforced Concrete for Roads, Sewerage, &c.," by A. E. Collins, M.INST.C.E., city engineer, Norwich.

"Fire Brigade Organisation and Equipment," by W. A. Farnham, engineer and surveyor, Foots Cray Urban District Council.

"Notes on Sewage Treatment by Forced Aëration," by J. P. Wakeford, M.INST.C.E., city surveyor, Wakefield.

"Ejectors," by I. Shone.

"Protection of Ancient Buildings."

PROVISIONAL PROGRAMME.

Thursday, June 24th.—General business of the institution.
Presidential address and presentation of premiums.
Road conference.
Annual dinner.

Friday, June 25th.—Road conference.
Opening of Road Exhibition.

Saturday, June 26th.—Visits to Engineering Works.

Cost of Horse-keep. The following summary of the cost to the Nuneaton Corporation of horse-keep per week (exclusive of horsekeeper's wages) appears in the annual report of Mr. F. C. Cook, ASSOC.M.INST.C.E., the borough engineer and surveyor of Nuneaton: Bedding, 11·42d. per horse per week; forage, 11s. 4·27d. per horse per week; [illegible], 10·35d. per horse per week; shoeing, 1s. 3·31d. per horse per week; veterinary surgeon, 4·23d. per horse per week; sundries, 5·05d. per horse per week; total, 15s. 2·65d. The sum charged by haulage contractors for horse, cart and man per day is 7s. 6d. The work done by the corporation horses is booked in the same way as if it were carried out by the hired hauliers. Putting the effective life of a horse at seven years, and allowing for stable rent, horsekeeper's wages, and all other charges, the nett saving in maintaining a stud of fourteen horses, as compared with hiring from hauliers, was £112 17s. As a matter of fact, the borough engineer points out, the saving is considerably greater, inasmuch as the corporation horses are at hand for all emergencies, and are more convenient for the work of the town in every way.

* Nominated by the council, as no nomination papers were received from the members on or before the prescribed date.

THE STABILITY OF QUAY WALLS ON EARTH FOUNDATIONS.*

By F. E. Wentworth-Sheilds, M.Inst.C.E.

In spite of the large amount of experience which has been gained in the construction of quay walls, it is still one of the most difficult problems in engineering to design a wall on an earth foundation with confidence that it will be stable when completed. A warehouse or a bridge can now be designed not only with the assurance that it will bear its load, but also with a knowledge of its factor of safety sufficiently accurate to satisfy the designer that material has not been wasted. But the same certainly cannot be said of a retaining wall on a soft bottom—at all events, not of a wall, say, 40 ft. to 80 ft. high, such as is commonly needed to sustain the quays of a modern dock. Even if the designer of such a wall is assured that it will stand, he cannot with any confidence tell one what factor of safety it possesses. The cause of his uncertainty is, of course, the difficulty of ascertaining the actual lateral pressure imposed by an earth backing, and the actual resistance offered by an earth foundation. His difficulties are thus different from those of the engineer who has to design large masonry dams. The latter structures are invariably placed on a foundation of solid rock, and the designers' chief care is that the stresses in the masonry of which the dam is composed shall not exceed a safe limit. The dock engineer, on the other hand, has to be careful that his wall shall not move as a whole on the comparatively soft material on which such structures have in general to be placed. The object of this paper is to consider the uncertainties and difficulties which the designer of a quay wall has to face, and, if possible, to ascertain how far calculations can assist him, and how far he must trust to judgment based on experience. It is also intended to urge upon the Concrete Institute the importance of collecting information upon this subject in the hopes that by degrees these difficulties and uncertainties may be cleared away.

A retaining wall may fail, as a whole, in two ways:

(1) By sliding forward on its base, and

(2) By overturning.

It may be said at once that, as regards quay walls, at least, the former mode of failure (by sliding forward) is by far the more common.

The conditions of stability in a "gravity" wall may be summarised thus:—

The forces tending to thrust the wall outwards (generally the lateral pressure of the earth backing) must be at least equalled by the forces tending to restrain it or thrust it inwards. The latter forces are generally the pressure of the water under it in front of it, the resistance of the earth in front of its toe, and the horizontal resistance to shear (or the friction) at the base of the wall. If these horizontal forces balance, the wall cannot slide forward.

The resultant of the outward forces, however, is almost always at a higher level than the resultant of the inward forces. Thus a couple is formed tending to overturn the wall about its toe. This couple induces a counter couple tending to keep it upright. The forces forming this counter couple consist, on the one hand, of the weight of the wall acting vertically downwards, together with the weight of any earth or water which may lie above the base of the wall, and, on the other hand, the upward resistance of the earth under that base.

If the upward resistance of the earth beneath the wall is capable of forming with the downward weights a couple at least equal to the overturning couple, the wall cannot overturn.

In order that the earth beneath the wall shall be capable of forming this righting couple, two things are necessary. It is obvious that the centre of the earth's resistance must be forward of the centre of gravity of the wall and of other loads on the base, and generally it is forward also of the mid-point of the base of the wall. Consequently the intensity of upward resistance is generally greatest at the toe and least at the heel. In order to preserve stability the resistance at the toe must not be greater than the maximum which the earth is capable of offering, and that at the heel must not be less than the pressure induced by the tendency of the earth to rise at this point.

Calculations for the stability of quay walls cannot in our present state be always relied upon, and failures on the one hand and waste of material on the other are liable to occur even to the most careful and experienced designer. This, however, is not saying that such calculations should be entirely ignored. On the contrary, they are most useful in suggesting means for increasing in the most economical manner the stability of designs which are known or suspected to be weak.

The author here dealt with some devices which have been used for increasing the stability of quay walls—namely: (1) Admission of water into dock, (2) sinking foundations deeper, (3) building buttress walls in front on main wall, (4) making wall wider, (5) removing a portion of the backing, (6) improving backing, (7) sloping base of wall, (8) driving piles under base, (9) anchor ties, (10) lengthening toe.

In conclusion it may be said that, owing to the difficulty and expense of making experiments on large walls, it is the more important that careful records should be kept and published of both successes and failures in this class of structure. Such records should include not only dimensions of the wall, and careful notes as to the nature of the materials employed, but also the calculations for stability, with the formulæ used, the assumptions made for the values of constants in those formulæ, and the reasons for such assumptions.

It is, of course, unlikely that it will ever be possible to design large quay walls purely from rules and without some measure of judgment, but if a body of information, as suggested above, could be collected and analysed, it would help to clear away some of the uncertainties which now beset that interesting, though troublesome, problem—the most economical design of high quay walls on earth foundations.

* Abstract of a paper read at the last meeting of the Concrete Institute.

A GOOD MATERIAL FOR PATCHING.

Owing to the restriction of loans from the Road Board this year as a result of the abnormal conditions to which the country is subjected owing to the national crisis we are at present passing through, one assumes that much of the work done upon the roads throughout the country during the year will take the form of repairs, rather than actual construction, and there is accordingly bound to be a large amount of patching done.

Bi-Tarco, which contains a large amount of pure bitumen and other agglomerating substances, forms an ideal binder for this class of work, and very large quantities of this material are used annually in this connection.

It is interesting to know that Messrs. R. S. Clare & Co.'s materials comply in every respect with the requirements of the High Explosives Department of the War Office.

WE AGREE.

The following is from *Punch* of Wednesday:—

"Wanted, a Two-legged Horse, not less than 16 hands.—Apply, Borough Surveyor, Tamworth.—*Tamworth Herald.*

"Unless the animal is wanted for the local museum, we would suggest that one with more legs, even if fewer hands, would be preferable."

Fungus in Effluent Pipes from Sewage Farms.—Will any surveyor who has had trouble with this nuisance and successfully dealt with it kindly communicate with a fellow official who is anxious to obtain information respecting the question? Address "A. B. C.," c/o The Editor, The Surveyor, 24 Bridle lane, Fleet-street, London, E.C.

Architects' Volunteer Training Corps.—The council of the Society of Architects, in response to an appeal for financial assistance from the committee of the Architects' Volunteer Training Corps, which now forms the 4th Battalion of the Central London Regiment (Volunteers), is sending the committee a donation of 25 guineas towards the Preliminary Expenses Fund. Major E. C. P. Monson (T.D.), president of the society, has been gazetted Sub-Commandant of the corps, and will be glad to hear from any members of the society who are not eligible for H.M. Forces and have not already joined any other Volunteer corps, with a view to their joining the Architects' Corps.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of SURVEYOR *readers with a view to making the information given under this head as complete and accurate as possible.*

INQUIRIES HELD.

Axbridge R.D.C. (April 20th. Mr. W. O. L. Meade-King). £1,000 in connection with the scheme, almost completed, of improving the East Brent to Weston-super-Mare road.—It was explained that of the originally estimated cost of £7,800 the Road Board had made a grant of £2,000 and the county council had granted £500, the arrangement being that the remainder of the expense should be borne by the Axbridge Rural and the Weston-super-Mare Urban District Councils in the proportions of four-fifths and one-fifth respectively. Evidence in support of the application was given by the county surveyor, Mr. E. J. Stead, and the surveyor to the rural council, Mr. J. K. Dunster.

Ballymena U.D.C. (April 23rd. Mr. P. C. Cowan). £7,000 for the extension of the waterworks. It was stated that the [illegible] obtained agreements from the owners of [illegible] properties with one exception. Under the old scheme the council were only entitled to a supply of water from the Quoile River of 1,440,000 gallons a week, but under the new arrangement they would be entitled to take a supply of 3,400,000 gallons. The owner [illegible] put under these agreements about £2,200 as compensation. Mr. J. E. Crousdaile, M.INST.C.E., Belfast, stated that he had prepared plans and specifications for the laying of an extra 7-in. pipe from the reservoir to the filter-beds, at a cost of £2,989, with £610 for [illegible] a total of £3,600, which, with the compensation allowances, brought the total [illegible] to £37.

Belfast R.D.C. (April 21st. Mr. P. C. Cowan).—£329 for the purpose of [illegible] and Whitehouse [illegible]. The [illegible] he need scarcely remind the council that in these war times it was the duty of local authorities to reduce capital expenditure as much as possible and to keep it to a minimum. That was for various reasons. First of all the [illegible] of interest were high; and, secondly, labour was dear. Those were reasons why works involving capital expenditure should not be gone on with except they were really urgent. Mr. Hugh Harper briefly outlined the nature of the extensions proposed. Three separate loans had been sanctioned by the Local Government Board. The first was for £6,500, the second for £3,500, and the third for £800. All the works which were required to be done, and for which those moneys were obtained, had now been completed and the money paid over. The present inquiry had to do with extensions on the Antrim-road, costing £88; the Ballyclare-road, costing £99; and the Carnmoney-road, costing £119.—There was no opposition.

Croydon T.C. (April 20th. Mr. George L. Pepler). —This was an inquiry into an application for permission to prepare a town planning scheme for an area of 800 acres in the Beulah Hill district of Croydon.—There was no opposition, except in the form of an intimation from the Ecclesiastical Commissioners that they did not wish 150 acres belonging to them to be included, as they had already decided that its development should be on town planning lines.

Malton R.D.C. (April 20th. Mr. A. W. Brightmore). £820 for a water supply scheme for Whitwell. —It was stated that several years ago Sir Edmund A. Lechmere, the lord of the manor, carried out successful boring operations, and provided water for the village at a cost of about £700. Two years ago he offered to hand the plant over to the Malton Rural District Council, and this offer was accepted. It had, however, been found necessary to make extensions, and it is for that purpose that the money it is proposed to borrow is required. The clerk (Mr. G. S. Cattle) asked that the repayments should be spread over a period of thirty years.

Portrush U.D.C. (April 26th. Mr. P. C. Cowan). £500 for the extension of the waterworks. Evidence as to the urgency of the scheme was given by councillors and officials. In the course of the inquiry it transpired that a serious waste of water was going on to the extent of 2,300 gallons per hour. The quantity used throughout the town was 5,000 gallons per hour, or 120,000 gallons per twenty-four hours for a population of 2,000. Mr. Cowan remarked that there [illegible] as would supply the whole town.

APPLICATIONS FOR LOANS.

Bedwellty U.D.C.—£3,000 for gasworks extensions.

Carlisle T.C. [illegible] of the [illegible] Blackwell road.

Holland C.C.—£345 for small holdings adaptation works, and £220 for school building improvement.

Mansfield T.C.—£300 for sewerage works.

Nottingham T.C.—£4,500 for hospital extension.

Stoke Newington B.C.—£4,000 for the electricity undertaking.

LOANS SANCTIONED.

Birmingham, Tame and Rea Drainage Board.—£47 [illegible]

Gloucestershire C.C.—£4,300 for school buildings.

Seaford U.D.C.—£568 for sewerage works.

FORTHCOMING INQUIRIES.

APRIL

1. **Biggleswade.** For the construction of a [illegible] (Mr. A. W. [illegible] 5,000
4. **Newport (Mon.).** [illegible] disposal (Mr. P. M. Crosthwaite) ... 14,820
5. **St. Albans.** For works of sewage disposal (Mr. A. W. [illegible] 4,761
6. **Farnham.** For works of sewage disposal (Mr. A. W. [illegible] 15,240

ASSOCIATION OF MANAGERS OF SEWAGE DISPOSAL WORKS.

By permission of the town council and the borough engineer, Mr. Ernest J. Elford, M.INST.C.E., M.I.M.E., a visit will be paid to the Southend-on-Sea sewage disposal works and refuse destructor on Saturday, May 8th. Objects of interest: Grit and screening chambers; modern sedimentation tanks; roughing filters; percolating filters; pumping station and plant, including Humphrey pump; destructor works.

PROGRAMME.

2.50 p.m.—Visitors to alight at Prittlewell Station (G.E.R.) and proceed to the works (five minutes).

3.15 p.m.—Visitors will be conducted over the works by the borough engineer, who will give a description of the works.

5 p.m.—Visitors will be entertained at tea

Visitors arriving early will find the following places of great interest—viz.: Corporation promenade pier; swimming bath; esplanades; Boulevard, Thorpe Bay and Southchurch cliffs, bandstand, &c. Trains leave Liverpool-street (G.E.R.), 1.50 p.m.; Southend to Prittlewell, 1.35, 2.0, 2.15, 3.20. Trams from Southend to Prittlewell—about fifteen minutes' walk from works.

Proposed New Water Supply for Lanarkshire.—An inquiry has been opened in Edinburgh into the Provisional Order of the Middle Ward of Lanarkshire for the introduction of a new water supply. Under the order the eastern area of Dumbartonshire is sought to be included in the Lanarkshire area.

Wolverhampton Water Bill.—The hearing of the case for and against the Wolverhampton Corporation Water Bill, which occupied the attention of the Select Committee of the House of Lords all last week, reached its closing stages on Wednesday with the termination of the evidence against the proposed pumping station at Ivetsey and the delivery of speeches by counsel.

Manchester City Surveyor's Appeal.—As the result of a special appeal issued recently by the city surveyor of Manchester, Mr. T. de Courcy Meade, and a visit from Captain Walkley, twenty-nine of the city surveyor's staff have joined the Army, making, with the twenty-three already enlisted since August, a total of fifty-two out of the 154 members of the staff.

The Government and Epping Forest.—At the meeting of the City of London Corporation, Mr. Harry Bird, chairman of the Epping Forest Committee, mentioned that there were several proposals before a Governmental inquiry now in progress which very seriously interfered with Epping Forest. Several important arterial roads were under discussion, and it was only by the courtesy of the conference that the superintendent of the forest was permitted to attend

Municipal Work in Progress and Projected.

The Editor invites the co-operation of Surveyor *readers with a view to making information given under this head as complete and accurate as possible.*

The following are among the more important projected works, of which particulars appear below: Buildings—Tottenham; housing and town planning—Merthyr, Holmfirth; refuse disposal—Newark; roads and materials—Brighton, Dulverton; sewerage and sewage disposal—Aylesbury, Dorchester, Golcar, Pontefract; water, gas and electricity—Clutton, Kidwelly. Particulars of other projected works will be found on our "Local Government Board Inquiries" page.

BUILDINGS.

Dulverton R.D.C.—It has been decided to rebuild Broc Bridge, situated on the road leading to Southmolton, and to improve the approaches. Towards the rebuilding of the bridge the Somerset County Council are making a grant.

Fermanagh C.C.—Professor Scott, of Dublin, has been appointed architect in connection with the scheme for a new sanatorium which it is proposed to build at Enniskillen.

Holme Cultram U.D.C.—Mr. J. C. Boyd, engineer, reported recently to the council that the Silloth sea wall had been completed at last. The council decided to appoint Mr. Boyd consulting engineer in connection with the structure for one year.

Hull T.C.—The Health Committee have resolved (after hearing a verbal report from the town clerk as to an interview with the Local Government Board) to proceed with the work of building the tuberculosis hospital, with which good progress has already been made. The committee refused, after a long discussion, to allow the substitution of "first quality Swedish" timber for "St. Petersburg" timber in the contract.

Tottenham U.D.C.—Subject to the approval of the Local Government Board, it has been agreed to purchase 14½ acres at Devonshire-hill, at the rate of £550 per acre, as a site for a proposed hospital.

HOUSING AND TOWN PLANNING.

Holmfirth U.D.C.—A revised plan of the council's housing scheme has been forwarded to the Local Government Board.

Merthyr T.C.—A scheme for the erection of workmen's houses is to be prepared for Gellyfaelog.

Taunton T.C.—In consequence of the increased cost of timber through the war, a sum of £56 has been added to the tender of Mr. H. G. Smith (which originally amounted to the sum of £1,765) for the erection of twelve additional workmen's dwellings at String-lane.

Weetslade U.D.C.—The council are giving consideration to the housing conditions of the district.

PARKS AND OPEN SPACES.

Stourbridge T.C.—The proposed purchase by the council of the Studley Court estate for the purposes of a public park has been referred to the Baths and Parks Committee.

REFUSE COLLECTION AND DISPOSAL.

Chatham T.C.—The town clerk of Rochester has written stating that his corporation do not see their way to join the Corporation of Chatham in establishing a joint refuse destructor for the two towns.

Newark T.C.—The council on Monday adopted a recommendation of the Sanitary Committee to consider the provision of a dust destructor at once.

Teddington U.D.C.—It was decided last week to send up the names of sixteen men for use in the output of munitions. The chairman, Dr. Langdon-Down, said that if they went he would suggest that the collection of refuse should be made every other day instead of daily, and the same with street scavenging, and work that was done weekly might be done fortnightly.

Wolverhampton T.C.—The tender of Messrs. Mossay & Co., Limited, London, at £630, has been accepted for the supply of a 2½-ton Orwell electric vehicle and equipment for the removal of ashes from the generating station at Commercial-road, the expenditure to be paid out of the reserve fund.

ROADS AND MATERIALS.

Abergele and Pensarn U.D.C.—An estimate for repairing and tar-painting three roads, amounting to £677, has been forwarded to the Road Board.

Arbroath T.C.—A scheme is to be prepared for the further development of Viewfield-road.

Bath T.C.—The city surveyor, Mr. C. R. Fortune, and several members of the corporation have been appointed as a deputation to visit such places as they think fit to inquire into new methods of carrying out repairs and laying out new streets.—The city surveyor has received instructions to obtain tenders for making up parts of Chaucer-road and Bath-road.

Brighton T.C.—The Tramways Committee recommend tramway rail renewals and the repaving of the front yards with granite, at an estimated cost of £1,700.

Bury St. Edmunds T.C.—The borough surveyor, Mr. W. D. Harding, has received instructions to "make the best arrangements he can" with a tar distiller for the supply of 10,000 gallons of distilled tar if required.

Cheadle and Gatley U.D.C.—The tender of the Taroads Syndicate, Limited, at 1⅞d. per yard super., has been accepted for tar-spraying.

Delvin (Ireland) R.D.C.—It has been decided to adopt direct labour on the whole of the roads of the district.

Dulverton R.D.C.—Owing to the shortage of labour the council have decided to purchase a stone breaker, and are also contemplating the purchase of a tractor and trucks.

Fermanagh C.C.—A large number of new works came before the council last week, and the county surveyor stated that in one case the "road" proposed to be repaired was a little boreen, about the width of a donkey cart; in another case the lane ended in a bog and was little used by anyone; and in another the lane was for the accommodation of one man. All these lanes were illegal, and he was tired of protesting. The council, however, passed all the proposed works.

Flaxton R.D.C.—It has been agreed to accept the offer of the War Office to make a grant of £1 17s towards the repair of roads at Strensall.

Guildford T.C.—The Highways Committee reported that they had selected Mr. T. Davies, of Aberystwyth, as general foreman, but that he had since declined the appointment. They now recommended that the council appoint Mr. W. Chamberlain, of Chesham, at a salary of £3 a week instead of £50s. a week with a house. Mr. Heath said the committee had again been met with the difficulty that as soon as they chose a man his council made it worth his while to stop with them. As they had no suitable house to offer the general foreman, they thought it would be better to pay him another 10s. a week, and let him find his own house. The recommendation was agreed to.

Hertford R.D.C.—The surveyor, Mr. I. W. Riggs, has received instructions to carry out repairs to the road at Bennington leading from Blue Hill Farm, including widening at certain points and the cutting of a ditch to carry off the water.

Kingston (Surrey) T.C.—Of thirteen tenders received for the supply of 1,700 tons of broken granite at 16s. 4d. per ton delivered, that of the London Granite Company has been accepted.—The Highway Committee have informed the Commissioners of Police that they consider no necessity exists in the borough for kerbs to be whitened.

Lowestoft T.C.—The borough surveyor, Mr. G. H. Hamby, has received instructions to prepare plans for making up the road leading from Bridge-road, near Oulton Broad.

Notts C.C.—The county council on Tuesday last decided to postpone a portion of the Road Board scheme in the county, estimated to cost £16,126, thereby reducing the cost of the works to be carried out during the current year to £28,948. Owing to the increased cost of living since the outbreak of war, the

council complied with a request of the roadmen, and advanced their wages by 1s. a week.

Perthshire C.C.—The Perth District Committee have resolved to engage the services of a road engineer to report upon the state of the local roads.

Perth T.C.—It is proposed to relay with tarmacadam the footpath from Princes-street to Craigie, through the South Inch.

St. Germans R.D.C.—The chairman, Mr. John Spear, stated that an inspector from the Road Board had visited the district in connection with the repairing of certain roads, the cost of which would be defrayed by the board. The inspector had suggested that the work should be done by direct labour, and that if the council experienced any difficulty in getting the necessary labour the Government would be prepared to draft men into the district to do the work. Mr. T. Vosper said it was impossible to do the work by direct labour. They could not get the men. It was decided to ask for contracts with regard to the making up of the road at Wearde, which was to be done first.

Sandgate U.D.C.—It has been agreed to purchase 6,000 tons of crude tar from the Folkestone Gas Company at 3d. per gallon.

Sunbury U.D.C.—The Local Government Board having intimated that any loans sanctioned before March 12th which had not been taken up would require further sanction, the clerk, Mr. C. E. Goddard, had written to them with reference to resurfacing the Staines-road at a cost of £1,844. The board have now replied that they are not prepared to give the further sanction at present.

Woolwich B.C.—Two Laffly motor sweepers are to be purchased at a cost of £1,276.

SEWERAGE AND SEWAGE DISPOSAL.

Abersychan (Mon.) U.D.C.—The Building Committee have been asked to consider the question of constructing a sewer from the isolation hospital, at an estimated cost of £300.

Aylesbury R.D.C.—Messrs. Elliott & Brown have prepared a scheme for sewage disposal works in Cambington-lane. The estimated cost, exclusive of land, is £4,960.

Barrowford U.D.C.—The Local Government Board is being asked to sanction a scheme for the extension of the sewage disposal works.

Dorchester T.C.—Subject to the approval of the Local Government Board, it has been decided to make various alterations to the sewage disposal works, comprising extensions to existing tanks, increasing the depths of and false bottoms for filters, the provision of rotary type distributors, extra pumping plant, and laying out further land for irrigation purposes.

Golcar U.D.C.—The council have asked the Local Government Board for authority to proceed with the Crimble sewage scheme, at an estimated cost of £3,500, explaining that they have received an order from the court requiring them to cease polluting the local stream.

Hemel Hempstead T.C.—The borough engineer, Mr. W. R. Locke, is preparing a scheme for the treatment of the sewage from the new isolation hospital.

Maidstone R.D.C.—The surveyor, Mr. T. A. Busbridge, has received instructions to prepare a scheme of sewage disposal for the parish of Bearsted.

Plympton R.D.C.—With reference to a circular from the Local Government Board dealing with co-operation between civil and military authorities in sanitary matters, the medical officer, Dr. Scott, said the effect of the circular was that the Government expected the officers of the district council to supervise the sanitation of all the camps in the district. It was a pretty big order. The Local Government Board promised to recoup the council for any additional expenditure that would be incurred. He did not know how the work was to be done, but he proposed to report on the matter to the Works Committee at an early date.

Pontefract R.D.C.—Plans have been approved by the council for the extension of the Ferry Fryston sewage disposal works.

Seaford U.D.C.—An intimation has been received that the Local Government Board would not raise any objections to the council's proposals for works of sewerage and sewage disposal in connection with the camp, and were prepared to issue their formal sanction to the loan required for defraying the cost on the receipt of a copy of the resolution of the council authorising the application.

Windsor R.D.C.—The clerk reported that in consequence of a communication received at the last meeting, he had, as authorised by the council, written to the Public Works Loan Board asking whether there would be any difficulty arising in advancing the remainder of the loan arranged for carrying out the sewage scheme now in progress. He had received a reply from the board's secretary that if the council satisfied him it was impossible to postpone the completion of the sewage works, or that the scheme was an absolute necessity for the health of the locality, no difficulty would be raised to the remainder of the loan being advanced, but the council should not undertake any fresh work before communicating with the Local Government Board.

WATER, GAS, AND ELECTRICITY.

Ballycastle R.D.C.—A letter has been received from the Local Government Board again asking the council to expedite the arrangements connected with the scheme for the improvement of the Cushendun water supply. The clerk said that the plans were ready, and on receipt of this letter he had forwarded them to the board.

Brighton T.C.—The Lighting Committee recommend the acceptance of the tender of Messrs. Richardsons, Westgarth & Co., at £1,925, for the supply and erection at Southwick power station of a surface condenser.

Clutton R.D.C.—A scheme is under consideration for providing water supplies for a number of parishes.

Coleraine U.D.C.—The clerk stated that a letter had been received from the Public Works Loan Board asking that the instalment on the loan of £1,000 for improvements at the waterworks should be regularly paid. He took it that this meant that the loan had been granted, and he might advertise for tenders for the work.

Kidwelly T.C.—The borough surveyor, Mr. J. Morgan, has prepared a scheme of water supply for Llangadog.

Kingstown U.D.C.—The Dublin and South District Electric Supply Company have executed a deed of transfer of their electric lighting undertaking to the urban district council.

Lampeter T.C.—The improved water supply scheme has been completed at an excess of £200 over the contract price, due to defects found in one of the mains.

Mansfield T.C.—The Local Government Board have sanctioned a scheme, estimated to cost £2,000, for the provision of transforming and converting plant in connection with the electricity undertaking, additional current being required for the Clipstone camp.

Morecambe T.C.—It has been agreed to provide £1,700 in the estimates for the electric lighting of the town.

Nelson T.C.—The gas undertaking produced a nett profit of £5,299 last year, and the electricity undertaking a profit of £1,138.

South Westmorland R.D.C.—The Local Government Board's refusal to sanction the loan for the Meathop water supply is regarded by the council as serious, as the work had been done as a matter of urgent necessity, and partly to provide re-employment. The Local Government Board are to be asked to reconsider their decision.

Taunton T.C.—Having regard to the satisfactory financial position of the water undertaking the council have agreed to transfer from the profits to the borough funds a sum of £770, equal to a 2d. rate.

MISCELLANEOUS.

Bath T.C.—The city surveyor, Mr. C. R. Fortune, has prepared the annual statement as to the cost of the stud and upkeep of the stables for the year ended March 31, 1915. This showed that the cost as a whole had been somewhat less than the previous year, the weight of fodder consumed being 178½ tons, which amounted to 37·78 lb. per horse per day. This included 1·73 lb. per horse per day for extra feeds when engaged upon early and late cleansing. The quantity of litter was 27 tons, or 5·71 lb. per horse per day.

Belfast T.C.—The nett profit of the tramway undertaking for the year ended March 31, 1915, was £52,033.

Guisborough R.D.C.—The clerk reported that a representative from the Local Government Board recently had an interview with the chairman and surveyors of some of the Cleveland local authorities to ascertain what employees were available for war work. The surveyor, Mr. H. D. Woodcock, said if many more men went away for war purposes there would be nothing left for him to do, and he would offer his services for the manufacture of war munitions.

Kingston (Surrey) T.C.—The names of thirty workmen have been furnished to the Local Government Board as possibly available for use in increasing the output of munitions of war.

Southampton T.C.—The tender of Messrs. J. Morris & Sons, Limited, Manchester, at £1,085, has been accepted for the supply of a motor fire engine of 150-500 gallons per minute capacity, complete with 50 ft. fire escape and first aid equipment.

Stowmarket U.D.C.—It has been agreed to purchase for £320 a new fire steam engine out of the surplus possessed by the council.

Twickenham U.D.C.—The names of fifty-eight workmen have been sent to the Local Government Board, with a view to their release if required in connection with the manufacture of munitions of war.

York T.C.—It has been decided that the following works are imperative, and that their abandonment would involve heavy financial loss to the city: Hull road tramways extension; cottages for tramwaymen at Fulford; extension of the electric mains to Strensall, Poppleton, and Naburn; completion of the laying out of the Glen estate at Heworth; cooling tanks at the electricity works; and the purchase of the Tang Hall-lane site for a housing scheme.

PERSONAL.

Mr. S. W. Gibson, surveyor to the Darenth Valley Drainage Board, has received an increase of salary.

Mr. John Edward Stafford, formerly borough surveyor of Burnley, died recently, we regret to state.

Mr. Francis H. French, borough surveyor of Harwich, has been elected a member of the Royal Sanitary Institute.

Mr. Samuel Catley Parmenter, formerly surveyor to the Braintree Urban District Council, who died recently, aged eighty-three, left £33,319.

Mr. J. F. Wardle, surveyor to the urban district council of Wirksworth, has been appointed highways surveyor to the Bolsover Urban District Council.

Mr. L. Howarth, Bournemouth, was on Tuesday last appointed chief sanitary inspector to the Lowestoft Town Council and port sanitary authority at a salary of £200 a year.

Mr. W. Walker, surveyor and sanitary inspector to the Uttoxeter Rural District Council, was presented recently by the council and officials with a clock on the occasion of his marriage.

Mr. E. B. B. Newton, M.INST.C.E., borough surveyor of Paddington, has accepted a commission in the Royal Engineers (T.), and the council have adopted a proposition welcoming his decision to serve in his Majesty's Forces.

Mr. Henry Catchpole and Mr. Henry Arthur Newman have been appointed deputy engineer and deputy surveyor respectively to the Finchley Urban District Council during the absence of the engineer and surveyor (Mr. C. J. Jenkin) in Serbia.

Mr. S. H. Gardner, one of the surveyors to the Southmolton Rural District Council, has been appointed to act temporarily as highway surveyor of the district superintended by the late Mr. R. Kelland. Mr. Gardner had acted on behalf of his colleague during the latter's illness.

Mr. J. C. Haller, the present acting surveyor, was on Tuesday last appointed county surveyor of Nottinghamshire, at a salary of £500 per annum. The council on the same occasion agreed to a reorganisation of the county surveyor's and architect's departments, and a separation of the duties.

Mr. Peter Finnegan, of the county surveyor's office, Monaghan, has distinguished himself in the recent examination in Dublin for qualification as assistant county surveyor, by obtaining first place in all Ireland. Mr. Finnegan has received the warm congratulations of the Monaghan County Council on his success.

Mr. L. Marsden, aged thirty-six, sanitary inspector to the Heston and Isleworth Urban District Council for the past three years, has been appointed to a similar post under the Twickenham Urban District Council, at a salary of £140 per annum, rising by annual increments of £10 to £170, with an additional £10 per annum as inspector under the Game Act and Petroleum Acts. There were 113 candidates.

Mr. T. P. Frank, borough surveyor of Newark, sent in his resignation on Monday. Mr. Frank, it will be recalled, has been selected to fill the office of borough surveyor of Stockton-on-Tees. The Mayor of Newark said they regretted that Mr. Frank was going to leave them, and expressed the town council's appreciation of his services. The mayor's remarks were endorsed by Alderman Atter, chairman of the Highways Committee.

Mr. W. Stubbs, ASSOC.M.INST.C.E., borough engineer of Blackburn, has resigned, after holding office for nineteen years. The salary attached to the position is £700 a year. Mr. Stubbs's retirement is due to failing health. The General Purposes Committee of the corporation have placed on record their high appreciation of his work during the nineteen years he has held the position, and he has been invited to supervise until its completion the Parsonage reservoir scheme which he has organised.

The council of the Institution of Civil Engineers have made the following awards for papers read and discussed during the session 1914-15: The Telford Gold Medal to Mr. A. L. Bell (Rosyth); Telford premiums to Mr. C. W. Anderson (Chakradharpur, India), Sir Thomas Mason (Glasgow), Dr. H. F. Parshall (London), and Mr. H. E. Yerbury (Sheffield); and the Crampton Prize to Mr. F. D. Evans (Kuala Lumpur, F.M.S.). The awards for papers to be published in the "Proceedings" without discussion will be announced later.

Sanatoria Building.—It is of vital importance that sanatoria should be built absolutely free from damp. Tuberculosis is a disease where dryness and warmth are necessary. Many architects for sanatorium work specify that the buildings shall be treated with waterproofed concrete and in all cement renderings. The recently erected Knightwick sanatorium was treated with the powder Pudlo.

Town Planning Institute. At a meeting of this body to be held at 9 Conduit-street, W., on Friday, May 14th, Mr. Thomas H. Mawson, HON.A.R.I.B.A., will read the remainder of his paper, entitled "Some of the Larger Problems of Town Planning"—some extracts from the first portion of which appeared in THE SURVEYOR of March 19th. The annual meeting is now fixed for the afternoon of June 23rd.

FOR OTHER ADVERTISEMENTS
See End of Paper.

BEDDINGTON AND WALLINGTON URBAN DISTRICT COUNCIL.
SURVEYOR.

The above Council invite applications for the appointment of Surveyor to the Urban District. The approximate area of the district is 3,200 acres; rateable value, £120,000; population, 15,300.

The salary will be £300 per annum, and the person appointed must devote the whole of his time to the duties of his office, and not engage in any outside work.

Applicants, who must be over 25 and under 40 years of age, must be thoroughly qualified to undertake all duties in connection with the office of Surveyor to an Urban Authority.

Applications, in candidate's own handwriting, stating age, experience and qualifications, accompanied by copies of not more than three recent testimonials, and endorsed "Surveyor," must reach me not later than 12 noon on Tuesday, 11th May next.

Canvassing in any form is strictly prohibited, and will be deemed a disqualification.

T. BOOTH,
Clerk to the Council.

Council Offices,
Manor-road,
Wallington,
Surrey.

SOME RECENT PUBLICATIONS.*

Municipal Office Organisation and Management. A Comprehensive Manual of Information and Direction on Matters connected with the work of Officials and Municipalities. Edited by William Bateson, A.C.A., F.S.A.A., borough treasurer of Blackpool. Price 20s. nett. London: Sir Isaac Pitman & Sons, Limited.

The subject of municipal organisation is of such great importance to the country generally that a new work of the dimensions of the present one requires more than passing comment. The present time, in view of the serious depletion of staffs owing to the European War, seems a most fitting one for the issue of a work on office organisation, as it is only by the most careful attention to system that undermanned office routine, which is so essential for efficient administration, can be maintained satisfactorily.

It will be impossible in the brief review we are undertaking to deal fully with the various sections into which the work is divided, some of which are written by independent authorities, but a few points upon the introduction and opening chapters call for special mention.

Mr. Bateson, in his opening remarks, draws attention to the absolute necessity of a knowledge of detail for successful organisation. At the same time, where extensive areas or municipalities are being reorganised, the chief officer should be equally capable of appreciating the importance of delegating to the assistants under him the multifarious duties and details for which he is responsible. In these days of specialisation and departmental administration, the organiser must be quick to recognise organising ability in others, for the acme of efficiency can only be obtained by individual excellence in all officers. To obtain this effectively, Mr. Bateson points out the necessity of making each assistant or clerk solely responsible to the chief for the work specially delegated to his appointment, and he also emphasises the necessity of written reports.

At last year's annual meeting of the Institution of Municipal and County Engineers, in the discussion upon the paper entitled "Organisation as Applied to a Municipal Engineer's Department," questions were raised as to the inadvisability of written reports as tending to waste of time and lessening of responsibility, but we are of opinion the principle then enunciated, and again set forth in Mr. Bateson's book, cannot be too much emphasised in public offices, where no break in the efficiency should ever be contemplated. In this connection Mr. Bateson rightly points out the disadvantage of abnormal secrecy being exercised by the chief officials and lays down the principle of making the deputy-chief cognisant of all important matters, in order that, should anything untoward happen to the one or the other, no break in the effective administration should occur. Similarly the principle of inter-departmental communications and conferences is advocated, with especial reference to statistical departments.

We notice the old principle suggested in the past by the Local Government Board for the clerk to issue orders for all departments does not appear to be advocated, and with this we entirely agree, since it is the chief of each department who should be solely responsible for the issue of orders, providing duplicates of these are sent to the accountant's or treasurer's department as an additional check.

Useful diagrams are provided showing the various sections into which departmental work can be divided, but these should not be taken too literally, as, although one can see that Mr. Bateson has wisely consulted engineers and surveyors upon these, what may be suitable in one district may often be usefully modified in another.

We ought here to sound a note of warning as to "over-organisation," since, while we agree as to the importance of organisation and specialisation in municipal offices where the number of officials exceed three and four figures, the consideration of any system must be dealt with on broad lines, and the real organiser only adapts to the circumstances of his particular case those factors which will avoid this pitfall. Mr. Bateson also draws attention to the large number of 25,403 local authorities which have the control of local revenues, and the following paragraph indicates the enormous expenditure upon local government and the importance of efficiency in administration.

"In addition to the annual revenue and outlay in current accounts, there was, at March 31, 1912, a responsibility on the principal rate-spending local authorities to repay, within prescribed periods, no less a sum than £413,000,000 in respect of loans raised for public works and purposes; but towards the redemption of this sum there was an accumulated amount of over £22,000,000 standing to the credit of sinking funds and similar funds. Ten years ago the Chancellor of the Exchequer called attention to the fact that in the period from 1880 to 1890 local indebtedness in England and Wales had increased by £62,000,000, and that in the decade from 1890 to 1900 the amount had been further increased by £95,000,000, making an increase of £157,000,000 in twenty years; while the State in that time had reduced its gross capital liabilities by £132,000,000. It is not easy to discover the relationship between local and Imperial loan indebtedness. The former is largely remunerative, but the latter is not."

Most useful chapters in the book are those on the collecting and recording of statistics. These could be studied with advantage by all departments of local authorities. Section 4, dealing with the town clerk's department, has been written by Mr. Arthur S. Wright, and is undoubtedly an excellent *résumé* of the work required by this department. Mr. Wright has also dealt fully with the various Public Acts regulating elections, and the information with regard to committee work, Provisional Orders, arbitrations, and the relationship with Government Departments [illegible] local matters.

In section 5, under the heading of "Finance Department," rate estimates and the intricacies connected therewith are very ably discussed by Mr. Bateson in his usual comprehensive manner. Personally we favour the income and expenditure system, although the receipts and payment system is also dealt with. The importance of a "working balance" cannot be too widely emphasised, as if this is maintained by a municipality considerable economy can be effected in regard to discounts, in addition to obtaining a name for prompt payment, and thus being able to purchase at the very best prices. Mention should also be made of the importance of quarterly statements of receipts and expenditure for submission to the Finance Committee. We have always advocated similar statements for the consideration of every spending committee, and where any material variation occurs above or below the estimate, the chief of the department should lay the reasons for such variations before his committee.

Under section 6, Mr. Harold Greenwood gives a most useful article upon local taxation licences, and we know of no more comprehensive record having been condensed into such a limited space.

In section 7 Mr. Bateson suggests a printing and stationery branch of the finance department. While we agree that this may be advantageous for large municipal organisations, such as the London County Council, the Metropolitan Water Board, or similar authorities, we must again sound a note of warning as to over-organisation, which must be borne in mind by the lesser authorities. In section 8 the public health department is fully dealt with by Mr. Fred Berry, who inclines to the card system. This we agree can be very usefully adopted for public health work, and lends itself to easy reference.

Mr. W. J. Pringle, in section 9, gives a very complete *résumé* of a police department, including fire brigade work, testing of weights and measures, and so forth. It is, of course, clear that the authorities affected under this section are comparatively few; but organisation is none the less important, and the principles set forth and the several tabulations should prove very helpful. Mr. Pringle has also given skeleton plans for central and divisional police stations and other buildings, and, though we think there is room for improvement in the designs, it is helpful to the designer to have the ideas of a gentleman of such known ability as Mr. Pringle, who is the chief constable for the county borough of Blackpool. The details as well as the administration charts are most comprehensive, and should prove of exceptional utility to new county boroughs when taking over police administration. We are not fully in agreement that police and fire organisation should necessarily be controlled by the same chief, as we consider that in large municipalities there is room for two entirely separate departments, while with the smaller authorities it is often more desirable for the fire protection department to be under the engineer to

*Any of the publications reviewed, or referred to as received, will be forwarded by the St. Bride's Press, Limited, on receipt of published price, plus postage in the case of nett books.

the council. The importance of organisation, however, is equally great in either case, and the information given as to fire brigade work is very useful.

In section 10 Mr. Percy Farnworth, borough treasurer of Bolton, deals with both the history and management of parks and pleasure grounds, and gives a brief *resume* of the powers of local authorities, with information as to by-laws and charges. The same writer similarly treats cemeteries and burial grounds under section 11, and the numbering method shown on the diagrammatic plan of a cemetery could be usefully considered by any local authority taking over the duties of a burial board.

Baths and wash-houses in section 12, and markets and fairs in section 13, are both dealt with by Mr. Farnworth, and call for no special comment.

In sections 14 and 15 the working of the Old Age Pension and National Insurance Acts are fully explained by Mr. Bateson himself, and the tables and information given in connection with the latter should be of great benefit to all municipal authorities.

Mr. Walter Powell, chief librarian of Birmingham, gives a very excellent *résumé* of public library work in section 16, mentioning briefly the card charging system as applicable to both "closed" and "open access" libraries. Mr. Powell appears to have very carefully considered the needs of borrowers, and his section of the work and the several forms for comparative statements should be read by all librarians.

Under the head of municipal trading Mr. E. Cooke deals with gas undertakings, Mr. S. B. N. Marsh writes upon a tramways department, and Mr. F. J. Alban is the author of an article on waterworks; but we are not informed as to the authorship of electricity departmental organisation. These four sections may briefly be considered as trading departments, and as such are upon a somewhat different plane to all the others, although we incline to the opinion that waterworks should not technically be described as a trading department, the efficient supply of water being an absolute necessity.

It is impossible, in the limited space at our disposal, to review fully the excellent suggestions made by the several specialists, but from a preliminary perusal we consider that, although in detail there may be room for some modifications, the principles enunciated are excellent, and can form the basis for the creation or remodelling of departments with proper organisation which should lead to ultimate economy.

Mr. R. Eccleshall, in section 21, deals with the justice's clerk's department, while in section 22 Mr. W. S. Body writes upon housing and town planning. We are of opinion that this latter section could have been treated in a more elaborate manner, although the brief *résumé* given by Mr. Body is excellent from the layman's point of view.

We are somewhat surprised that such a limited space should have been allocated by Mr. J. E. Pickles to the education department, this being one of the principal spending departments connected with a large municipality; but what has been indicated in the few pages given to it should be of considerable utility to those whose education departments require reorganising. We are also somewhat astonished at the limited space allowed to sections 24 and 25—viz., the surveyor's department and the sewage disposal works. In the latter case we are informed the author is Mr. J. D. Watson, the able chief engineer to the Birmingham, Tame and Rea District Drainage Board, and that is sufficient to indicate that the subject matter is well worth careful perusal. There is, however, room for further suggestions in regard to the surveyor's department, and we anticipate that in any future issue this will be amplified. As a whole we can confidently recommend this book as one which should find a place upon the library shelves of every municipal officer, and we feel sure that it will for many years remain the standard work upon the subject. In conclusion we must compliment Mr. Bateson upon the ability and energy he has displayed in bringing together so much useful data upon a subject which is so bound up with efficiency in municipal administration, and we confidently anticipate that his work will be widely read.

The Modern Factory: Safety, Sanitation and Welfare. By George M. Price, M.D. Price 17s. nett. London: Chapman & Hall, Limited.

The scope of this work, which is published in New York by Messrs. John Wiley & Sons, is indicated by the title and sub-title. The subjects dealt with are of the greatest importance from the point of view of public health, having regard to the very large proportion of the population which to-day finds employment in factories. A preliminary chapter deals with the factory, its rise, growth and influence, while among the more important matters subsequently considered may be mentioned fires and their prevention, accidents and safety, light and illumination, factory sanitation, air and ventilation, industrial dusts and dusty trades, industrial gases, poisons and fumes, and factory legislation. The book may be described as a comprehensive review of the safety and sanitary conditions of factories and workshops as they are, together with an account of the methods of safety, sanitation, efficiency and welfare of factories and workshops as they should be.

Masonry as Applied to Civil Engineering. By F. Noel Taylor. Price 6s. nett. London: Constable & Co., Limited.

Although the introduction of steel and reinforced concrete has to a certain extent ousted masonry from the supreme position which it formerly occupied as a material of engineering construction, it is still used to a very large degree for certain classes of work. In setting forth the theoretical considerations with regard to masonry structures, therefore, the author of this work is dealing with a subject of practical importance. The first chapters are devoted to a description of the several stones used in constructional work, and to a discussion of labour on stones. The structures dealt with in later chapters are retaining walls, dock and sea walls, dams, bridges, towers and pillars. Finally, the subjects of monolithic construction and shoring and underpinning are discussed. The book is clear in style and copiously illustrated, while the author has, as far as possible, avoided the use of the higher mathematics.

SEWAGE WORKS MACHINERY.

GAS ENGINES REPLACE OIL ENGINES AT SUNBURY.

Mr. H. F. Coales, the surveyor, has presented an exhaustive report on the condition of the engines and machinery at the Sunbury Urban District Council's outfall works, and outlining a scheme the council has had in view for some time as to replacing the old and now inefficient oil engines. A new gas engine and air compressor had been installed, and had been tested over a period of fifteen months with very satisfactory results. The average running cost per hour of the gas-engine plant was a little under 4½d., while the cost of the two oil engines—the combined power of which does not equal that of the gas engine—was 2s. per hour. The average cost of oil used at the works prior to the installation of the gas engine was £400 per annum, and the estimated cost for gas engines would be £108, or an average saving of £292 per annum.

In view of these figures and the absolute necessity of providing a duplicate plant, the surveyor recommended the council to proceed with the laying down of a second gas engine, plant, and air compressor, and to remove the two old oil engines, which would be credited in the contract. The new machinery would be in duplicate, the engines could be worked alternately, and the wear and tear of continuous running would be avoided. There was just sufficient room in the engine-house and generation shed for the new machinery, so no structural alterations would be necessary. Estimates were submitted for different types of engines, the one recommended being a 66 max. h.p. Hornsby-Stockport gas engine and gas plant, and a 550 cub. ft. Reavell air compressor at a cost of £760. A compressed-air self-starting apparatus was also recommended to be fitted to the present gas-engine. An extra £100 would be required to provide for removing the old engine foundations, and making new foundations, new pipe trenches, alterations to pipes, &c., bringing the total outlay to, approximately, £860.

It was unanimously agreed to purchase the new plant recommended, subject to the consent of the Local Government Board, and Mr. Coales was warmly complimented on his clear report.

National Housing and Town Planning Council.—The council of the Society of Architects have, at the invitation of the National Housing and Town Planning Council, appointed delegates to attend a series of conferences which are being held in London on April 20th and 21st, Edinburgh April 27th and 28th, Liverpool May 12th and 13th, and Leeds May 19th and 20th.

Institution of Municipal Engineers.

MEETING AT NEWARK.

Members of the North-Eastern and Eastern Districts of the Institution of Municipal Engineers met a most enjoyable time at Newark-on-Trent, Notts, on Saturday, when various interesting buildings, ancient, restored and modern, were inspected, explanations of same being given by the local members, Mr. H. W. Lockton, M.S.A., and Mr. P. A. Watford, surveyor to the Claypole Rural District Council. The members were received at the town hall by the mayor, Mr. J. C. Kew, who welcomed them to the old and ancient borough of Newark, and gave a most interesting particulars of the town hall, which was built in 1773. H. Wright called their particular attention to the ball-room, which is considered to be one of the best Adams rooms in the country. The mayor's chain of office and the magnificent corporation plate, which were on view, were greatly admired by the members, the mayor explaining that in the Civil War some of the plate was melted down, the "siege pieces"—money relics of the "silver bullets" of the days when Newark was besieged being in existence to-day.

A visit was then paid to Newark Castle, where Mr. P. A. Watford pointed out, among other things, the Norman gateway, the room in which it is supposed that King John died on October 18, 1216; and the stones temporarily housed in the crypt which were dredged from the river Trent, and believed to be part of a Roman [illegible] wheel, the site of the castle built in 1130 by Bishop Alexander being previously that of a Roman [illegible].

The Ossington Coffee Palace, Trent Bridge, and Grestrap Library were pointed out by Mr. H. W. Lockton, who afterwards gave an explanatory statement in regard to the parish church, where the organist, Mr. W. T. Wright, A.R.C.O., gave a short, but much appreciated, organ recital.

An inspection was then made of the restored Tudor hall in the Old Magnus Buildings, formerly the Magnus Grammar School, and now in the hands of the borough elementary education authority for various educational purposes. Other interesting buildings examined were the shop which was formerly the Old Moot Hall, where the courts were held of the important Manor of Newark; the house occupied by the Governor during the Siege of Newark; old inns, such as the "Clinton Arms," "White Hart," and "Saracen's Head," which last-named has been in existence 1341, the shop where Byron's first poems were printed, Beam end Close, dating from 1330; the hospital, built in 1880; and the new Magnus Grammar School, designed by Messrs. Sheppard & Lockton, and built comparatively recently, at a cost of £10,000, excluding the cost of the land.

Before leaving the town hall, Mr. W. Matthews Jones, the president of the institution, voiced the thanks of the members to the mayor for his kindness in receiving them and giving them such a welcome.

The Mayor, in response, said he was glad to have an opportunity of recognising the good work and the high status of the profession which they represented.

Mr. W. Matthews Jones also cordially thanked the head master at the Magnus Grammar School for his courtesy, and said he felt sure that under such a talented head master the scholars who had the privilege of attending that magnificent school would have a splendid start in life.

Rev. H. Gorse, in acknowledgment, said they were very proud of their grammar school in Newark, as they were of most things in the town, and he could only hope that they would get as good a school in their respective towns as Newark had, and also get as good and real support from the inhabitants of their town as the Magnus Grammar School received from the people of Newark.

Tea was served at the "Saracen's Head Inn" by Host C. Smith, and the subsequent proceedings were of a most interesting character.

Mr. W. Matthews Jones (Chester) presided, supported by the Mayor of Newark, Mr. J. C. Kew. Also present were: Messrs. H. W. Lockton (Newark), P. A. Watford (Claypole), John Bailey (Spalding), C. A. Howard (Brigg), A. Harford-Stevens (Blaby), Geo. Mathews (South Holland), G. A. Penwill (Peterborough), G. H. Kemp (Newark), F. Harrison (Newark), J. S. Ewart (Bridgford), G. Wooldridge (Newark), F. H. Ellis (Sleaford), A. Parry (Sleaford), W. G. Shepherd (Kesteven), R. J. Kettleborrow (Belvoir), R. Parker (Southwell), R. Madins (Newark), G. Belson Chilvers, hon. district secretary, and B. Wyand, secretary of the institution.

The PRESIDENT, having given a few historical facts in regard to Newark and Chester, said that the members had been particularly interested in the various places they had visited, both ancient and modern, and especially by the beautiful parish church. In this connection he paid a warm tribute to the skill of the organist, Mr. W. T. Wright. It was very gratifying to see that the people of Newark were keeping up their old structures, but, coming from an ancient city which was particularly jealous of its ancient monuments, he must say he had seen some things in Newark which would not be tolerated in Chester. At the rear of the house occupied by the Governor at the Siege of Newark he found some fine half-timbered work which had been whitewashed over. In another instance he found that a tradesman had put a frightful sign over some very beautiful old work. Speaking of their institution, he said it was formed so that the members might derive benefit from meetings such as they had had that day, where members could take back to their own towns impressions which would be of value to them. Their object was to improve their minds and improve themselves, and so to help others. There was one matter of regret he would have to mention. He noticed in THE SURVEYOR they were advertising for a surveyor and engineer to their corporation, but the advertisement said the gentleman appointed must be an associate-member of the Institution of Civil Engineers or of the Institution of Municipal and County Engineers. Nothing was said of the Institution of Municipal Engineers. They as a body considered themselves quite equal if not in advance of the Institution of Municipal and County Engineers, their members having to have practically the same qualifications, but they were debarred by the advertisement from applying for the appointment. He hoped if any member of their institution were among the selected candidates, he would have an opportunity of expressing his views.

In conclusion the president cordially thanked the Mayor for his kindness.

The MAYOR, in response, thanked the president for his references to Newark, where he saw they maintained appreciation for the noble town, with its glorious history and traditions. He was very glad to have met the members, because it was always a good thing to get new ideas. He had heard with interest what had been said of Chester with regard to what they did to individuals who despoiled ancient property which they had purchased, over which, he took it, the local authority had no control. He hoped what he had heard would bear fruit if ever in Newark they had a chance of interfering with any projected vandalism which might occur in their midst. They did treasure the premises which the president had referred to, and were glad that even so much remained intact. He was pleased to meet them because their profession had a great bearing upon the public life of the country, and especially upon public health. The amenities of our towns were largely in their hands. They had to do with new buildings, town planning, and the opening out of old courts, and replacing of old worn-out buildings; also those matters of sanitation which had so much influence on public life. Speaking of the parish church, he said it had been his pride and privilege to have succeeded in raising nearly £2,000 for the repair and restoration of the tower. The mayor also referred to the restoration of the Tudor Hall, which they had visited, and reminded them that the work had been carried out by one of their members, Mr. Lockton. As a Newarker he was proud to think they had recovered this splendid structure from what was most unpromising material when it fell into the hands of the corporation. He hoped the new school designed by Mr. Lockton would for many years remain a memorial to that gentleman's ability. With regard to what the president had said concerning the advertisement for a new borough surveyor and engineer, he could only hope it would

not prevent members of their association applying. There was no doubt Newark was a stepping-off place for able young men, and he instanced the case of the present borough surveyor, who was leaving a post at £250 to take one which would rise to £750. He hoped all their members would not only improve their minds, and acquire knowledge, but be ambitious and keep before them high ideals of the public service.

The function concluded with votes of thanks to Mr. G. Belson Chilvers, the hon. secretary of the district; Mr. W. T. Wright, the organist; Mr. Ewart, who after tea gave a musical monologue and a ventriloquial sketch; and Mr. Lockton and Mr. Watford for arrangements made by them in the planning of a very enjoyable day.

VISIT TO LONDON NEW COUNTY HALL.

By the permission of Mr. W. E. Riley, the council's official architect, a visit was paid on Saturday, April 24th, by the members of the Southern and South-Eastern Districts of the institution to the new County Hall works of the London County Council. Among the members present were Messrs. Horace Boot and E. A. Stickland, past-presidents of the institution; John Denton (Tettenhall), C. A. Trimm (Kingston-on-Thames), T. C. Barralet (Godstone Rural District Council), F. Leslie Morrison (Islington), H. J. Higgins (Lewisham), G. E. Gulliver (Lewisham), and Arthur Palmer, honorary secretary of the Southern district, and a number of visitors also attended. The party was conducted over the work by Mr. Gilbey, the assistant clerk of works, who answered questions galore, and carefully explained the various aspects of the work and of the drawings to the entire satisfaction of everyone.

The building, so far in carcase only, is of a composite construction—viz., brick with stone facings, upon a steel framework, the whole standing upon a horizontal concrete raft of 5 ft. depth at one level—*i.e.*, without the usual footing courses.

This raft, being considerably below high-water mark, is held intact by a heavy granite embankment wall built very deep upon wood piles, due allowance being made for the natural actions of the river and periodical dredging. The stonework upon all façades is of Cornish granite and Portland stone, the latter of which has all been worked in London.

The Council Chamber on plan is approximately central, with the departments and offices built upon the square about it. The chief façade fronts upon the Thames, with a members' private terrace in crescent form at a level well above the public embankment. It is this central feature, with its 38-ft. columns which appears to receive the bulk of the architectural beauty in elevation, thus breaking the somewhat plain monotony of the outer flanks.

The approximate estimated cost of the building was £1,500,000, and the site occupies an area of some 5½ acres. An excellent model of the whole building to scale was shown to the party prior to their departure giving a very good idea of what its appearance will be on completion.

Fire-Resisting Glazing.—Two reports have been issued by the British Fire Prevention Committee on recent investigations undertaken by them with wired glass as applied to window openings and to skylights. These tests are a continuation of a series of tests with wired glazing, which they started some ten years back at the instance of Messrs. Pilkington Brothers, Limited, of St. Helens, and the series of some seven reports, spread over the last decade, shows the remarkable manner in which the fire resistance of glazing of this type has been successfully developed. The two reports now presented afford remarkable evidence of the fact that wired glazing, when used vertically in windows, has withstood the heavy strain of the British Fire Prevention Committee's tests for a period of ninety minutes at temperatures gradually increasing to 1,500 deg. Fahr., the fire tests being immediately followed by the application of water from a steam fire engine applied at close range. Further, when used horizontally, this glazing has withstood a fire test of an hour's duration at similar temperatures, followed by a similar application of water. The maximum size of any piece of glazing under test in a vertical position was 4 ft. by 1 ft., and the maximum temperature attained in the skylight test was 1,600 deg. Fahr. Both tests are records for wired glazing, and claim considerable attention, as they put modern wired glazing, when suitably fixed, in the same fire-resistive rank as fire-resisting partitions and doors of considerably greater thickness and weight.

THINGS ONE WOULD LIKE TO KNOW.

(Contributed.)

Is it not to be hoped that the Departmental Committee of the Local Government Board who are investigating the question of the weights on the axles of heavy motor cars on our roads will take a broad view of the question, and, while endeavouring to safeguard our roads from vehicles which are known to be disastrous to them, will take care not to cripple the industries of the country by imposing restrictions which may be difficult or even impossible for the manufacturer to meet?

* * * *

Are not some of the principal points to be considered by the committee weight and speed, and the construction, diameter, width and character of the wheels and tyres? In connection with this, will it not be necessary for the committee to carry out some experiments, as there is at present much contradictory evidence as regards the damage caused by solid rubber twin tyres as against iron tyres? And is it not sometimes contended that the former type of tyre is the most damaging that can be used on a road?

* * * *

Were any municipal surveyors present on Thursday, the 22nd inst., at the annual meeting of the Roads Improvement Association? Would they not have been rather interested to have heard from a member of the Enfield Council that the landowners there are so powerful that they run the council? Would they not also have been interested to hear that several of the larger corporations are now so convinced of the good work done by the association that they are contributing annual subscriptions towards its support?

* * * *

What has been done with the special committee of the Royal Sanitary Institute on the "Abolition of Privies and Pail-closets"? If it is still in existence should it not take to heart the excellent letter of "Thothmes" in last week's issue of THE SURVEYOR, in which the danger of stored fæcal matter and flies is pointed out? Is it not to be greatly regretted that the Royal Commission on Sewage Disposal did not "dispose" of such methods of sewage "treatment" once and for ever?

* * * *

What is the trend of modern road construction at the present time? Is it towards a thin carpet of artificial asphalt, as some road engineers contend, or is it still in the direction of some form of tar-macadam, including, of course, tar-slag? Is it a fact that "tar" grouting is going out of favour because with this process the amount of grouting used must be excessive if anything like a successful result is to be obtained?

* * * *

What is the reason for the sudden activity of the council of the Institution of Civil Engineers? Why is it that, in addition to making an attempt at fixing the fees to be charged by their members for professional services, they are now proposing to call a special meeting to amend some of the by-laws? How long was it that the celebrated Rip Van Winkle slept? And have we any information as to what he did when he awoke?

* * * *

Will it not be a grievous pity if the proposed bridge over the Thames at Goring is to be a toll-gate bridge? Is it not common knowledge that such toll bridges have all eventually had to be freed at enormous cost to the ratepayers? And is it not to be hoped that the respective counties of Berkshire and Oxfordshire will be able so to finance the commissioners that the bridge will be a free one on completion?

Scarborough's Town Planning Scheme.—The Scarborough Town Council have adopted a comprehensive scheme of town planning and housing. The areas affected are in the Central and East Wards, the oldest and most congested districts in the town, and the scheme includes the construction of a new thoroughfare from the Newborough-street end of North-street (near the site of the Old Bar) to a point on the Sandside near the entrance to the Marine-drive and Promenade, the length of the new street to be approximately 1 mile. The scheme will be carried out in sections, the work being spread over a number of years.

ROADS IMPROVEMENT ASSOCIATION.

ANNUAL GENERAL MEETING.

The Hon. Arthur Stanley, C.V.O., M.P. (vice-president), occupied the chair at the twenty-eighth annual general meeting of the Roads Improvement Association, held at the Institution of Civil Engineers on Tuesday, the 22nd inst.

Mr. Robert Todd Chapman, who moved the adoption of the annual report, drew attention to the more important features of the association's activities during the past year. He emphasised the great good that had come from the association's conferences with road surveyors. Although the Horseshoe Competition had not succeeded in producing an ideal stone to meet modern road conditions, it had stimulated much general interest, and had demonstrated that there were other ways of dealing with alleged slippery roads than grumbling about them. The association proposed to continue its strong opposition to the re-enactment of the tax of 1d. per ton upon motors in any form whatever, and it was encouraging to note that the Government Departments were supporting this view. The report specified a very large number of actual improvements in various areas throughout the country upon which the association had been engaged. Every year saw a great increase in the association's activities, in spite of the marked improvement that had taken place in the condition of our roads during the last few years. Good roads were becoming more and more vital to the successful handling of commerce and the comfort of present-day life.

In seconding the report, Mr. W. Joynson-Hicks, M.P., congratulated the association upon its successful year's work. He was particularly gratified to notice how, during the last year or two, there had been a growing tendency for more consideration to be extended to all road users by local authorities and by the law courts. This was largely due to the educational work of the association.

The fact that the association had given considerable attention to the alleged needless damage caused to road surfaces by fast motor vehicles was remarked upon by Mr. W. Worby Beaumont. A report had been prepared in which certain alterations were suggested to the existing Local Government Board's regulations regarding heavy vehicles which it was thought would be more fair towards the owners of the vehicles, in addition to reducing the strain of such traffic on the roads. The matter was still receiving attention.

Mr. E. S. Shrapnell-Smith (hon. treasurer), in moving the adoption of the accounts, pointed out that the association had finished up last year with a small balance in hand of £96. Many economies had been effected for the carrying on of the work during the ensuing year, but, as the association only had a very small reserve—less than a year's income—he was counting upon a full measure of support from the constituent bodies for the current year. As definite evidence of the association's increasing influence with the authorities, and the growing recognition of the importance of its work, he was pleased to announce that the corporations of Liverpool, Bradford, Blackpool, Sheffield and Hornsey had this year intimated their intention of becoming subscribers to the association, and he believed several others would follow this example.

Speaking in support of the accounts, Mr. H. Percy Boulnois stated that, as an old municipal officer, he would emphasise the importance of the hon. treasurer's last announcement. Subscriptions of this character were only given by corporations after very careful consideration, and they demonstrated very definitely the confidence in the association and the utility of its work. He drew attention to the smallness of the association's annual income—barely £1,000—and considered that the amount of work it accomplished was remarkable.

Votes of thanks to the council and officers for their work in the past year, and to the chairman, the Hon. Arthur Stanley, M.P., for presiding, concluded the meeting.

Coast Sand Dunes (By Gerald O. Case, St. Bride's Press, Limited, 24 Bride-lane, E.C., price 5s.).—**The rapid increase of sand wastes around our coasts is indeed a serious one, and Mr. Case has done a valuable work in the writing of this book.**—*Southport Guardian.*

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

President—Mr. J. S. Pickering, M.Inst C.E., Borough Surveyor and Water Engineer, Cheltenham.

METROPOLITAN DISTRICT MEETING.

A Metropolitan District meeting is to be held this (Friday) evening at the offices of the institution, 92 Victoria-street, Westminster. All members in Greater London are specially invited to attend.

AGENDA.

7.30 p.m.—(1) To confirm minutes of the meeting held on March 26, 1915.

(2) To receive report of the secretary of the institution as to the election of district officers.

(3) To appoint Executive Committee.

(4) To consider communication from the council in reference to the question of heavy traffic. Discussion to be opened by Mr. O. E. Winter (Hampstead), as follows:—

(*a*) Construction of motor vehicles and traction engines.

(*b*) Approval of routes by road authority.

(*c*) Contribution by owners of vehicles to cost of road maintenance.

Norman Scorgie,
Hon. Secretary pro tem.

Hackney, N.E.

SCARBOROUGH MEETING.

An institution meeting will be held in the North-Eastern District at Scarborough on Saturday, May 8th.

Programme.

10 a.m.—Assemble at the town hall.

10.15 a.m.—Reception by his Worship the Mayor (Mr. C. C. Graham). A paper entitled "Catering for the Wants of the Holiday-maker," by Mr. Harry W. Smith, Assoc.M.Inst.C.E., borough engineer and surveyor, will be taken as read. Any discussion thereon may take place at the close of the meeting after the various works have been inspected.

10.45 a.m.—Inspection of Spa improvements, beach bungalows, South Cliff Gardens, bathing pool, &c., in the South Bay.

1 p.m.—Lunch at the Grand Hotel. (Tickets, 3s. each.)

2 p.m.—Meeting of the members of the North-Eastern District to consider—

(*a*) The report of the Executive Committee as to the desirability of reporting the proceedings of district meetings in the Press.

(*b*) Any other business.

2.30 p.m.—Leave the Grand Hotel by char-à-banc (tickets 2s. each) for the Castle Hill, to view the damage caused by the bombardment on December 16, 1914, by the German battleships, and to inspect the Keep.

3.15 p.m.—Leave the Castle Hill, and inspect the Alexandra Gardens, Floral Hall, Peasholm Park, and the beach bungalows and bathing establishment in the North Bay.

4.30 p.m.—Leave the north end of the Royal Albert-drive by motor char-à-banc for drive along the Marine-drive, Valley Park, to the Mere.

5.15 p.m.—Afternoon tea at the town hall by the kind invitation of his Worship the Mayor (Mr. C. C. Graham).

AYR MEETING.

At the Scottish District annual meeting to be held at Ayr on June 4th and 5th, papers on town planning, municipal housing, road work, and scraping of water mains will be submitted.

On the first day visits will be paid to the municipal works of the town, and the following day will be devoted to inspections of experimental road stretches in Ayr County and Hillhouse Quarry, and to a visit to Loch Doon.

MATLOCK MEETING.

The arrangements for the institution meeting to be held at Matlock on June 12th include visits to the new sewage works, the brine and electric baths, and other undertakings.

J. W. Dudley Robinson,
Secretary.

92 Victoria-street, S.W.

CONCRETE INSTITUTE.

The sixth annual general meeting of the Concrete Institute will be held at Denison House, Westminster, S.W., on May 6th, at 7.30 p.m., after which discussion will be resumed on Mr. Osborn C. Hills's paper entitled "The London Building Acts, with some Suggested Amendments."

The paper by Mr. E. A. W. Phillips, M.Inst.C.E., M.C.I., entitled "Lime Concrete in the East," which was to have been read on May 6th, will be read on May 22nd, at Denison House, Westminster, S.W., at 7.30 p.m.

It has been decided to abandon the fifth annual dinner this year.

H. Kempton Dyson,
Secretary.

APPOINTMENTS VACANT.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, *but those responsible for their despatch are recommended to arrange that they shall reach* The Surveyor *office by noon on* Wednesdays *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

ROAD FOREMAN.—May 1st.—Denbigh Town Council.—Mr. E. Parry, town clerk.

INSPECTOR OF NUISANCES.—May 3rd.—Corporation of Bradford. £95 per annum.—Mr. F. Stevens, town clerk.

BOROUGH SURVEYOR.—May 3rd.—Corporation of Newark. £250 a year.—Mr. Godfrey Tallents, town clerk.

SANITARY INSPECTOR. — May 5th. — Newport (Salop) Urban District Council. £121 per annum.—Mr. J. S. Underhill, clerk.

GAS ENGINEER AND MANAGER.—May 7th.—Corporation of Stoke-on-Trent. £500—£700 per annum.—Mr. E. B. Sharpley, town clerk, Town Hall.

SEWAGE WORKS MANAGER.—May 8th.—Bingley Urban District Council. 45s. per week.—Mr. Alfred Platts, clerk, Town Hall, Bingley.

SURVEYOR AND SANITARY INSPECTOR.—May 8th.—Wirksworth Urban District Council. £90 per annum.—Mr. J. Gratton, solicitor and clerk, Town Hall, Wirksworth, Derbyshire.

ASSISTANT TO SURVEYOR.—May 8th.—Maidstone Rural District Council. £2 10s. per week.—Mr. Thos. A. Busbridge, surveyor.

GASWORKS ENGINEER AND MANAGER.—May 10th.—Spalding Urban District Council. £150, with residence.—The Clerk, Urban District Council.

INSPECTOR OF NUISANCES.—May 10th.—Annfield Plain Urban District Council. £130—£150.—Mr. T. L. Watchman, clerk.

BOROUGH SURVEYOR. — May 15th. — Newport (I.W.) Town Council. £225—£250 per annum.—Mr. T. Ross Pratt, town clerk.

CLERK OF WORKS.—Tyldesley Urban District Council. £2 10s. per week.—Mr. Francis E. Jones, engineer and surveyor, Council Offices, Tyldesley.

ASSISTANT ENGINEERS.—Public Works Department, Government of the Gold Coast. £350—£400 a year, with furnished quarters.—Crown Agents for the Colonies, Whitehall-gardens, London, S.W.

ENGINEER.—Public Works Department, British Guiana. £300—£400.—Crown Agents for the Colonies, Whitehall-gardens, S.W.

ENGINEERING AND SURVEYING ASSISTANT.—Derbyshire County Council. £150 per annum.—County Surveyor, County Offices, Derby.

TEMPORARY ROAD FOREMAN.—Corporation of Cheltenham.—Borough Engineer, Cheltenham.

MUNICIPAL CONTRACTS OPEN.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, *but those responsible for their despatch are recommended to arrange that they shall reach* The Surveyor *office by noon on* Wednesdays *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

Buildings.

CARLISLE.—May 4th.—For pulling down property and clearing sites, for the corporation.—Mr. H. C. Marks, city engineer and surveyor.

DUNDEE.—May 5th.—For alterations to the office premises, for the parish council.—Mr. T. M. Cappon, architect, 32 Bank-street, Dundee.

LAMBETH.—May 6th.—For covering-in with corrugated-iron sheets, and the provision and erection of sliding doors at the depot, for the borough council.—Borough Engineer, Town Hall, Brixton-hill, S.W.

HUDDERSFIELD.—May 7th.—For the extension of the filter-house at Longwood reservoirs, for the corporation.—Waterworks Engineer, Town Hall.

DARTON.—May 10th.—For the erection of boundary walls and other works, for the urban district council.—Mr. S. Wilkinson, surveyor.

HOLYWOOD.—May 10th.—For the construction of a storage reservoir, filter and auxiliary works, for the urban district council.—Mr. J. A. Hanna, engineer, Ocean Buildings, Belfast.

GLASGOW.—May 13th.—For the erection of a sanatorium and children's home, for the corporation.—Mr. J. Lindsay, town clerk, Glasgow.

EAST LANCING.—May 17th.—For the erection of seven timber groynes at Shoreham, for the Sea Defence Commissioners.—Messrs. R. B. Grantham & Son, civil engineers, 5 Little College-street, Westminster Abbey, S.W.

Iron and Steel.

RICHMOND (Surrey).—May 5th.—For the supply of 100 tons of heavy cast-iron pipes and special castings, for the corporation.—Mr. J. H. Brierley, borough surveyor, Town Hall.

ST. PANCRAS.—May 11th.—For steel constructional work, for the borough council.—Mr. C. H. F. Barrett, town clerk.

WELLINGBOROUGH.—May 12th.—For the erection of a steel Dutch barn at the sewage farm, for the urban district council.—Mr. R. S. Henshaw, engineer and surveyor.

GOSPORT AND ALVERSTOKE.—May 13th.—For the supply of a pair of 18-in. stroke horizontal cross high-pressure, double-acting air compressors, with all necessary valves, pipe connections and foundations, for the urban district council.—Mr. H. Frost, engineer and surveyor, Gosport.

Roads.

ROMFORD.—May 3rd.—For the supply of broken granite and granite chippings, for the urban district council.—The Surveyor.

SWANAGE.—May 3rd.—For providing materials and labour for tar-spraying, for the urban district council.—Mr. W. H. Pearce, surveyor.

ELHAM.—May 4th.—For the supply of granite and basalt, for the rural district council.—The Highway Surveyor, Lyminge, Kent.

CAERLON.—May 4th.—For the execution of kerbing, channelling, and paving, for the urban district council.—Mr. T. R. P. Herbert, clerk, Skinner-street, Newport, Mon.

LLANDAFF.—May 5th.—For the supply of mountain limestone, for the rural district council.—Mr. James Holden, surveyor, 20 Park-place, Cardiff.

ST. GERMANS.—May 5th.—For remaking part of a road, for the rural district council.—Mr. F. E. Cleverton, clerk, 4 Buckland-terrace, Plymouth.

BROMSGROVE.—May 5th.—For the supply of 500 tons of 2½-in. machine broken granite, and 400 tons of unbroken granite, for the urban district council.—The Surveyor.

FULHAM.—May 5th.—For making up a new street, for the borough council.—Mr. F. Wood, borough surveyor.

BRUMBY AND FRODINGHAM.—May 7th.—For the supply of 800 tons of whinstone, for the urban district council.—Mr. Joe Green, surveyor, Council Offices, Frodingham, Scunthorpe, Lincs.

EAST ASHFORD.—May 8th.—For the supply of 300 barrels of tar, for the rural district council.—Mr. J. Kingsford, clerk, 7 Bank-street, Ashford.

JARROW.—May 8th.—For the cementing of footpaths, for the corporation.—Mr. J. Scott Weir, borough engineer, Town Hall.

MIDLOTHIAN.—May 8th.—For the supply of tools, ironmongery, brushes, oils, and other articles, for the roads department.—Road Office, County Buildings, Edinburgh.

The Surveyor

And Municipal and County Engineer.

Vol. XLVII. MAY 7, 1915. No. 1,216.

Minutes of Proceedings.

Public Soft-water Supplies.

Can a case be made out for a public soft water supply in addition to the ordinary water works, where the latter service provides a very hard water? It is a matter for consideration. Of course, the proposal is quite possible of accomplishment, but is it desirable? We know only too well the disadvantages in the use of very hard water. While for potable purposes it may be very palatable, and in some respects good for the younger generation, there are the outstanding objectionable qualities—the waste of soap and the incrustation of boilers and pipes. The housewife and the manufacturer are at one in their condemnation of very hard water. The housewife cannot extract the best from her tea or her dolly-tub, and the manufacturer is compelled to employ a solvent composition in his warfare against the formation of scale in his boiler. Most people have their own limited private supply of rain water, but, unless it is very carefully conserved, it will fail at some time or another when used freely for baths and general cleansing purposes. And once this supply has given out, the unhappy householder can do nothing to replenish it—he must use hard water. The domestic tank, too, often becomes fouled by the washing in of impurities from the roofs. The water not seldom is highly coloured and offensive to the smell, particularly when heated. Now the ideal conditions for the householder would exist if he were given an abundant constant supply of clean, soft water from a source beyond the sooty atmosphere of a town. How is it to be done? In the usual way, as from other water supply works—the construction of an impounding reservoir in a suitable watershed; the collection of rain water in showery seasons; and the delivery of it through a system of pipes at a constant pressure. The water not being required for drinking purposes would not need to be filtered. Such an auxiliary supply would mean a very much less general consumption of the ordinary hard water. The effect of this would be that the latter supply would last a town for a much longer period without augmentation. Further, the hard water could be treated as a more valuable commodity than the soft unfiltered water, which could be used for all general purposes, such as cleansing, swilling, and the sanitary services. There are objections to a duplicate system of water pipes in a town. Not only is there the expense of the two sets, but the liability of the workmen inadvertently tapping the wrong main. As against this objection, however, the two sets of pipes could be proportionately smaller than in the case of a single system. It would seem that a small rain-water supply main would be all that was necessary if people had adequate storage tanks upon their premises, for in such a case the replenishment would be continuous night and day.

Taking all the above points into consideration, is a municipal engineer likely to recommend to his council a soft-water in addition to a hard-water supply? One cannot think that he is, in spite of what has been advanced in favour of the two. Is there an alternative system? The obvious answer is: Soften the hard water and supply it in one set of pipes—kill two birds with one stone in fact. But there are objections to a softening system too. If the water is made quite soft, it is not so good for potable purposes as hard water, and if it is only softened down to a certain extent it is not such a good cleanser as rain water. There again it seems uneconomical to soften water for use on the sanitary services and in swilling, and so forth. In the case of water softening by a public authority, no doubt there could be a saving to householders in that the provision of rain-water cisterns would be unnecessary. But we must bear in mind that the permanent water service would then be of one uniform type—there would be no choice for the user. If, on the other hand, a scheme could be devised whereby the water was softened one day—or one week—and not the next, then the householder, provided with storage tanks and stop taps, could get in a fresh supply of softened water for his bath and his washing, and the town would be saved half the cost of softening the whole of the town supply. It would be a somewhat difficult problem, perhaps, to pull all these public and private strings to the general satisfaction, but there is not general satisfaction by any means in the use of crude, hard-water supplies now. Of course, if individual householders themselves softened the water on their own premises, they might, by a system of duplicate service pipes, strictly assign the two waters to their respective best uses. The expense, we are afraid, would prevent many householders undertaking the work, and probably it would either be considered altogether too luxurious or too absurd. There are to-day, no doubt, a few folk who provide themselves with softened water "in parts" by a partial softening process, just as there are public authorities who provide inferior quality water for street watering or public baths. The cost of softening the whole of a town's hard-water supply would be cheaper, probably, than paying the outgoings, including interest and loan repayments, on a separate soft-water supply installation. And it is the question of cost that weighs chiefly with municipalities. Ideally, the two sets of water would be the better service for consumers, but the objections before noted weigh too heavily against the idea.

* * *

Highways in British Columbia.

The economic importance of a good system of highways in a country in course of development can hardly be over-estimated. The realisation of this fact by the Government of British

Columbia has resulted in considerable activity in recent years. Thus, since the year 1908, there have been constructed in that province no less than 7,000 miles of highways in addition to some 2,200 miles of "trail." These facts appear from a most interesting article specially contributed by Hon. Thomas Taylor, the Minister of Public Works, to our Toronto contemporary the *Contract Record*, and the successful achievement of so much work is specially creditable having regard to the unique character of the prevailing conditions. Thus, the immense territory to be opened up, and the widely-scattered population, coupled with the extreme variations in climatic and physical conditions, necessarily render the development of an adequate highway system both difficult and costly. It is perhaps specially worthy of note that highway engineers in British Columbia have been faced with problems arising from motor traffic similar to those which have confronted their *confrères* in this country. So acute, indeed, has the situation become that special legislation has had to be passed to govern the use of provincial highways by self-propelled vehicles. Such legislation, however necessary it may be as a temporary expedient, is essentially retrograde—a fact which is amply demonstrated by the history of highway administration in this country. The only way of progress is to adapt the roads to the traffic, rather than the traffic to the roads, and this is fully recognised by Mr. Taylor, who frankly acknowledges that traffic restrictions must ultimately have an adverse effect on rural districts, and points out that in a very short time British Columbia must face the problem of constructing a trunk road system at considerable expense capable of carrying a combined traffic of a heavy type. So thoroughly is this realised that at the present time very great thought and care are being given to the mapping out of what will ultimately be a great trunk road system for the whole province, and surveys and investigations in connection with the projected scheme are now in progress. The backbone of the scheme as outlined at present consists of a trunk road running generally north and south through the province, and another road or other roads running east and west. It is proposed to connect up these with the Great Pacific highway in the United States and the Transcontinental road of the Dominion of Canada. In connection with both of these undertakings the province has up to the present time set a splendid example to other countries by the extent and quality of the work that has been completed.

* * *

Dublin Corporation and Decayed Workers.

An idea, now almost obsolete, used to prevail that any kind of labourer—the lame, the aged, the halt, and (in many instances) the feeble-sighted—were quite good enough for road work. Many factors have contributed to the creation of other and better ideas on the subject of road making and road maintenance, and gradually we have witnessed the evolving of a system which, while not perfect by any means, is yet a great improvement upon that which it has displaced. The better order of things is making itself felt in Ireland, slowly perhaps, but with sureness, and for this we have to thank the seriousness and sense of responsibility which the municipal surveyors there have brought to the discharge of their duties. That Dublin should show the way in fixing a high standard of efficiency in so far as its road department is concerned would be quite in accordance with the fitness of things. That it does this may be doubted, if we are to judge from the terms of a report submitted recently to the Corporation Paving Committee by Mr. Norman Chance, the assistant engineer. After dealing with the financial aspect of the subject, Mr. Chance glances at the moral situation, and what he states is certainly rather striking. Premising that having regard to the very large amount spent on wages it is of the first importance that the wages staff should be efficient, he proceeds to call attention to the fact that among the men engaged are a large number no longer capable of heavy labour. Out of about 150 labourers, excluding those employed in the depots, it appears that "no less than forty-five men, or 30 per cent (on a conservative basis), are incapable of ordinary labour." How such a state of things should be permitted is not clear on the surface. It is obvious that the professional advisers of the Dublin Corporation are not responsible for it, and we can only surmise that it is part of some system of patronage appertaining to the members of the corporation. If so, it stands self-condemned, and should cease without delay. Even if these helpless and useless workmen have spent the better part of their lives in the service of the corporation, there can be no justification for their continuing to be members of a staff which is called upon for what is essentially active service. They ought to be relegated to the pension list, and, in justice to the department and those who are responsible for its administration, their places on the working staff should be filled by men who are efficient. Being a business concern, the paving department of the Dublin Corporation should be conducted upon business and commonsense lines.

* * *

Urban and Rural Housing.

In our last issue we were able to present to our readers a full report of the valuable contribution made by Mr. Reginald Brown, M.INST.C.E., to the recent discussion at the Surveyors' Institution on "Urban and Rural Housing." In his introductory remarks Mr. Brown called attention to the fact that much of the overcrowding and insanitation that exist are largely due to the occupiers themselves. We agree that this may be a factor in the situation, and that there is plenty of scope for sound educational work in domestic hygiene. Apart from this fact, however, it must be admitted that there is to-day a general shortage of accommodation both in town and country. Dealing with the remedies for this unfortunate state of affairs, Mr. Brown advocated equality of treatment between local authorities, public utility societies, and private builders in the matter of financial assistance. For this there is a good deal to be said, although we cannot here enter into an argument on this aspect of the question. Next, Mr. Brown suggested an increase in the period of the loans for buildings, roads and sewers to eighty years. This would have an undoubted effect in reducing rents, but it is open to question whether part of any reduction secured by this expedient would not be at the expense of the general ratepayer. We cordially agree that the crux of the problem lies in the difficulty of providing for the man with low wages and a large family, and Mr. Brown's suggestions in this connection are most interesting. He proposes that in letting houses preference should be given to those receiving the lowest wages and with the largest families; and that the National Exchequer should make grants to local authorities and others based on the number of children of non-earning age for whom accommodation is provided and actually utilised. To this scheme one school of politicians would probably object that it is in effect subsidising low wages, but Mr. Brown would no doubt prefer to regard it as a bounty given for the purpose of

encouraging a higher birthrate—a matter of national concern. Mr. Brown's contribution to the discussion was of peculiar value, inasmuch as it was based on a full knowledge of the facts.

* * *

The Royal Sanitary Institute.

Perhaps the most interesting part of the annual report of the Council of the Royal Sanitary Institute for 1914 is that which deals with the work accomplished in connection with the war. In the first place, the Institute has, by means of its examinations and equipment, been able to give medical attendance, at the request of headquarters, to many lectures and demonstrations to the officers and men of ambulance and sanitary companies. In this effort the council have had the co-operation of many well-known lecturers in these subjects, who readily gave their help, and devoted a large amount of time to the work, and the staff of the Institute, though reduced to half its usual number by reason of those who have enlisted in the Army, willingly undertook the extra work involved in the arrangements for these lectures. The lectures and demonstrations given up to the end of the year numbered over 100, with a total attendance of officers and men of 13,000.

In addition to this important educational work a willing response has been made to several requests by the military authorities that the Institute should make known the formation of new ambulance and sanitary companies. The publication of these requirements in the Journal brought them under the notice of the 4,500 members and associates throughout the Empire, and offers of enlistment were received by the Institute from all parts of Great Britain, and from India and Canada. At the present time no fewer than 200 members and associates are connected with the Army and Imperial Forces. The report also refers to the organisation of National Health Week, and states that prior to the outbreak of war over 100 towns and districts had under contemplation the observance of Health Week in some form. This showed very good progress as compared with previous years, but, in view of the prevailing circumstances, the committee after full consideration decided to postpone any general celebration until the conditions are more propitious.

Problems of Artificial Lighting.

The subject of artificial illumination has received considerable attention in recent years, and the consequent progress, both in theory and practice, has rendered possible the production of architectural effects which were formerly unattainable. The problem of artificial illumination as applied to buildings, which was discussed at the last meeting of the Society of Architects, ought not to be regarded entirely from the æsthetic point of view important as this may be. In addition, it must not be forgotten that another primary consideration is the optical comfort of the inmates. The discussion was opened by Mr. S. D. Chalmers, M.A., the head of the department of technical optics at the Northampton Institute, whose very instructive paper was avowedly limited to the relation of artificial illumination to architectural effects. He pointed out that the great contrast between the Classic and Gothic styles is closely associated with the variation of the lighting conditions, and, applying the same general principles to interior ornament, he argued that the more diffuse and less direct the lighting the more is it necessary to intensify the mouldings, carvings, and other relief. When the lighting comes from above in a comparatively narrow beam the ornament must be in low relief, while a general diffused lighting from in front is more suitable for cases of deeper relief. Particularly where rooms are to be used mainly by artificial light, the architectural features should be designed in relation to the actual method to be employed. For this and other purposes Mr. Chalmers concluded that there is room for development and the production of new and improved arrangements.

* * *

A Lesson in Tact.

One scientific man has devoted his attention to a particularly dead-alive subject, dealing with the subject of road repairs which appeared under the heading "Cycling Notes and News" in a recent issue of our contemporary the *People*. The writer begins by pointing out that road repairing and tarring operations will soon be in full swing, and proceeds to suggest that cyclists in each locality should wait upon the surveyor for the purpose of impressing on him "the necessity of doing the work in a systematic manner." He then refers to the pamphlets on road making and repairing which can be obtained from the Roads Improvement Association, and suggests by implication that these may usefully be employed as a species of tract for distribution among surveyors and road foremen. The last sentence must be quoted in full: "Many surveyors are willing enough to do the work properly, but, unfortunately, *they do not always know how*, and information upon the subject, *if tactfully given*, is often welcome." (The italics are ours.) A new terror will indeed be added to the existence of the surveyor if he is to be subjected to a continuous campaign of spiritual conversion or education at the hands of the cyclists of his district. Modern highway construction and maintenance is far too technical a matter for the mere amateur, and although the complaints of cyclists, as of every other class of road user, are entitled to the most careful consideration and attention, we venture to suggest that as a body they are not fitted to give instruction to surveyors in the rudiments of their business.

* * *

Water Waste.

Water engineers are familiar with the fact that, even with the most thorough precautions and the best possible system of inspection, it is not practicable to prevent a considerable amount of waste from taking place. Indeed, Mr. F. F. Longley, who has recently reported on the question to the St. John's, Newfoundland, municipality, estimates that the cities which have devoted most attention to the measurement of the water supplied, and having every service metered, are unable to account for from 15 to 30 per cent of the total flow. Mr. Longley was originally consulted owing to the fact that the municipal board found that the supply and pressure were apparently becoming inadequate. Calculation showed that the supply amounted to 166 gallons per day per head of the total population, or to no less than 300 gallons per day based upon the population actually connected with the distribution system. This, of course, showed either abnormal waste on the part of the consumers or the existence of some wholesale leakage. No appliances for measuring waste which would give the best results were available, but the methods of location devised by Mr. Longley met with considerable success, the general conclusion being arrived at that by far the greater part of the waste occurred in the house services. Hence the recommendation for a general installation of meters as rapidly as finances would permit, and the further suggestion that night inspection by sounding at the cocks should be repeated periodically.

Heavy Traffic Problems in London.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS DISCUSSION.

The heavy traffic problems of London were the subject of discussion at a Metropolitan District meeting of the Institution of Municipal and County Engineers held at 92 Victoria-street, Westminster, on Friday evening last. Mr. T. W. A. Hayward (Battersea), vice-president, occupied the chair, and there were present Prof. E. R. Matthews (University of London), Messrs. J. Birch (East Ham), W. Nisbet Blair (St. Pancras), P. G. Killick (Finsbury), Norman Scorgie (Hackney), E. F. Spurrell (Holborn), J. Sutcliffe (Deptford), E. Willis (Chiswick), O. E. Winter (Hampstead), and J. Williams (Hampstead).

Mr. Winter observed, in introduction, that we were now passing through what was nothing less than a revolution in traffic, and that one of the effects of the war, the increasing cost of horses and the improvements that were going on in mechanical vehicles, would be to hasten that revolution. In considering the questions to be dealt with by the Departmental Committee, they had to take a broad and comprehensive view. The transit of people and goods were vital considerations for London, and as engineers they did not want to place any unreasonable restrictions on mechanical transport. Undoubtedly their own experience showed them that it was, on the whole, a more economical method of traction, and not only that, but it had many highly important sanitary advantages over the old system of horse traction. He had with him a diagram showing the effect on the total cost of road maintenance in Hampstead since the introduction of heavy motor traffic—commencing with the year 1904. They would see from that that they had been able to reduce their total expenditure on highway maintenance and construction during the past three or four years. A high figure in 1912 was accounted for solely by the fact that motor omnibuses commenced to run on a new road which they were compelled to deal with at once. It was imperative that when such traffic went on to a road the use of ordinary macadam had to be discontinued immediately. He thought the diagram was very instructive. It referred not only to heavy-traffic roads, but to the whole of the roads in his district. He did not say that the diagram proved that the cost of their main roads had decreased; on the contrary, he thought the cost of maintenance of those roads had increased. On the other hand, there had been a saving in the cost of maintaining side roads which had been reconstructed on methods more adapted to motor traffic, in spite of the first cost. So it looked as if road costs were not going to be increased if the roads were reconstructed in a proper manner to meet the traffic. Therefore, as engineers, he thought they should not show any prejudice against heavy motor traffic, but rather encourage it as against horse traffic, not only for economical reasons, but on sanitary grounds. But there were certain restrictions and regulations which might reasonably be put forward in connection with heavy motors and traction engines. Heavy motors, he suggested, should be provided with wheels of larger diameter, and the tyres should be of rubber or other forms of resilient material. He thought that was especially desirable in London. In Hampstead the damage which the heavy traffic had caused to property as a result of the vibration had brought forth many complaints. He was inclined to think that the adoption of the bigger wheel would, with the rubber tyre, considerably reduce that trouble, and at the same time be more economical with regard to the effect on the roads, and, he ventured to submit, more economical as regarded the maintenance of the vehicles themselves. The next suggestion was that there should be a strict limit of weight on small wheels in any new regulations. There was no doubt the heavy weights carried on motors on small wheels had had a very destructive effect on their roads—on foundations, at any rate. In Hampstead 6 in. of concrete had been found quite inadequate. At the same time, he thought the heavy motor 'buses were the chief offenders in that respect. His view was that heavy vehicles with steel tyres should be restricted to a speed of 4 or 5 miles an hour. That would encourage the use of rubber tyres, which he thought was becoming one of their chief requirements in London. If traction engines were to be allowed in the London area he regarded it as a reasonable restriction that they should be provided with proper springs. The vibration these vehicles set up at present with the heavy loads they carried was no doubt a cause of great damage. He suggested that all projecting bars on the wheels of these vehicles should be removed and diagonal cuts substituted. As to contributions by owners of vehicles to the cost of road maintenance, as they knew, Middlesex last year obtained power to impose a charge per mile on motor omnibuses passing over the new Great West Road, and he thought it might be fairly arguable that special traffic like the London 'bus traffic should contribute some reasonable sum towards their roads. At present a tramcar contributed £203 per annum, and, it was estimated, a motor 'bus about £40. That seemed to him somewhat disproportionate and highly favourable to the motor 'bus. The 'bus was a popular means of conveyance, and they did not want to arrest its development in any way, but he thought it reasonable, having regard to the charges put upon its competitor, the tramcar, it should be made to contribute in a greater degree than it did at present. Even allowing for the larger carrying capacity of the tramcar, the motor 'bus was highly favoured as things stood. With regard to the question of the approval of routes by road authorities, it seemed to him the road authority ought to be consulted before a 'bus route was opened up. At present there was a great waste of public money because of the sudden adoption of a 'bus route on a road that was totally unfitted to carry such traffic, and in Hampstead they had had to spend hundreds of pounds in repairing roads damaged in that way. Then it sometimes happened that a road after having been put in a condition suitable for the heavy 'bus traffic was deserted for a more profitable route. The local authority was thus put to a quite unnecessary expenditure.

Prof. E. R. Matthews inquired whether the sudden increase in cost shown in the diagram exhibited by Mr. Winter was due to loan charges. [Mr. Winter: No.] Proceeding to refer to the vibration caused by motor-'bus traffic in London, the speaker suggested that it would be a great advantage if tests could be made as to the extent of that; it might prove of interest particularly to those members who gave evidence before the Departmental Committee. He could quite understand that owners of 'buses would take up the attitude that the conditions of to-day were different to what they had been in the past, and that the roads must be constructed so as to meet the altered conditions. If it were proposed to put forward proposals for a contribution by the companies it would be interesting to have a suggestion as to the basis on which that should be made.

Mr. E. Willis (Chiswick) observed that in the case of very heavy tractors the more driving wheels they had the less strain there was on the roads. In that connection he thought there was a future for the pedrail system, which lessened the tractive effort by as much as 300 per cent. In place of a wheel there were feet which came down with a universal joint something like an ankle joint, and these, instead of destroying, actually compressed the road. At Chiswick he had had the same experience as Mr. Winter in the matter of concrete foundations, and had found it necessary to replace 6-in. with 9-in. and 12-in. material. All trenches were now reinstated with 12 in. of concrete, which he found absolutely necessary in order to get a satisfactory surface. His view was that they must make their main roads free of any charges to motor 'buses and heavy locomotives; at the same time they ought to have power to regulate the traffic on other roads. If an authority could obtain a guarantee that motor-'bus traffic would continue to use a certain route for a long period they would then be willing to incur some expense. Frequently the 'buses went on to a road in which there were trees, and that promptly upset the whole character of the district owing to the pruning that became necessary.

Mr. E. F. Spurrell (Holborn) quoted figures showing how motor traffic had increased the cost of road maintenance in his borough. The heavy traction engines had even cracked some of the granite setts which they had put down in recent years.

Mr. W. Nisbet Blair (St. Pancras) stated that he also had had to take up 6-in. concrete foundations

under wood paving which had carried traffic for fifteen years without any damage occurring. A macadam road, he thought, with its appurtenances, was to be taken up in a completely new manner. They had to raise it all, and put in 12 in. of concrete. In other districts macadam roads had to be taken up to make room for tramway tracks along the centre; they simply could not keep the macadam on the roads. It was all "alive." He had found that the 9 in. by 4-in. setts which had since been adopted were split in the manner described by Mr. Spurrell. The motor lorries which were responsible for the damage carried coal, and they had also broken up portions of 3-in. by 6-in. sett paving. He attributed it to the steel-bound wheels and narrow tyres of these vehicles, and the speed at which they were run. They carried a nett loan of 10 tons, which was nearly all on the back wheels. Such traffic did undoubtedly crush the setts, and the damage occurred whatever form of grouting was adopted. The remedy was to make the surface as smooth as possible; the more they reduced the impact by substituting a rolling contact, so much would they reduce the damage. But he did not think the whole cost should fall upon the ratepayers of a district the roads of which had to bear a traffic that [illegible] with roads in other districts. With regard to 'bus traffic the central districts had to bear the heavier burden in maintenance, and he considered that the companies owning these vehicles should be called upon to make a contribution [illegible]. Parliament had always thought fit to impose on tramway systems. At present the companies paid rates on the property it occupied, but the districts through which the 'buses ran did not benefit. His view was that a reasonable basis for contribution should be on the 'bus mileage. He agreed that restrictions should be placed on the design of heavy vehicles, and that where these travelled at more than a walking pace the adoption of resilient tyres should be required.

Mr. NORMAN SCORER (Hackney) said it seemed to him that they had been paying too much attention to motor 'buses. When they considered that steam cars, road locomotives and traction engines paid nothing but their licence duties towards the upkeep of the roads, then he thought they had a grievance. But there was a danger in taxing these vehicles unduly, because whatever tax was put on them would not be borne by the owners, but would be handed down to the commodities they carried. Mr. Willis had spoken about the pruning of street trees. But the highways were not made for trees. Roads were a means of passage, and should be kept as open as possible. At the same time one class of vehicle should not be favoured as against another. He joined issue with Mr. Blair on the suggestion as to 'bus mileage being an equitable means of taxing. The City of London and the borough of Holborn probably had a greater 'bus mileage than any other district in the Metropolis, but he did not think the latter in its [illegible] areas did as much damage to the roads as they did in the outer fringe. The explanation of that was that the damage to the highways was caused by the pace at which the vehicles travelled. In those central areas the average speed was about 5 miles an hour; but it was very different in the outside districts, so he thought the 'bus mileage basis would be unfair. Mr. Brodie, of Liverpool, recently put the case in a nutshell when he said they had to endeavour to encourage the use of mechanically propelled vehicles for the purpose of transit, and that the fewer restrictions they put on it the better. They ought not, he said, to worry about the weights on them. He admitted that in Liverpool an odd sett or two was broken occasionally, but his policy had been to say nothing about it, but simply repair the damage. His (the speaker's) view was that Parliament would be very jealous of giving any other authority power to charge a rate per mile, and they had to remember that where it had been granted it only referred to vehicles plying for hire.

The meeting unanimously passed the following resolutions:—

(1) "That the damaging effect of heavy motor vehicles can be minimised by the use of wheels of large diameter, rubber or elastic tyres of a width properly adapted to the weight of the axle load, and suitable springs, and that all reasonable means of reducing the damage to roads caused by such vehicles should be enforced. (2) that heavy locomotives be fitted with proper springs, and that projections on the wheels be removed."

It was agreed that the resolutions should be brought to the notice of the council of the institution.

In the course of the meeting reported above the following were elected to form the Executive Committee of the Metropolitan District: Messrs. J. Rush Dixon (Woolwich), P. G. Killick (Finsbury), E. B. B. Newton (Paddington), J. Sutcliffe (Deptford), C. A. Hazeltine (Stepney), and E. W. Swinstead (St. Pancras). The two last named were elected as associate members, but we find on reference to the institution list that Mr. Swinstead belongs to the class of member.

HYDRATED LIME IN ROAD CONCRETE.

The State Roads Commission of Maryland, under the supervision of Mr. H. G. Shirley, chief engineer, is making some interesting experiments on the effect of about 10 per cent of hydrated lime mixed with the Portland cement used for concrete highway pavement. The first experiment (states *Engineering News*) was made in the summer of 1913 on a State road in Wicomico County. The proportions of hydrated lime to cement, by weight, varied from 10 per cent to 11 per cent.

The most noticeable effect of the hydrated lime on the wet mixture was increased plasticity. The ease with which the wet concrete slipped from the chute showed this. With a plain 1:2:4 mixture without the lime there was a tendency for the concrete to stick to the sides of the chute.

In reporting on the condition of the road in August, 1914, Mr. W. F. Childs, junr., resident engineer, stated that the sections in which the lime was used were apparently more homogeneous and dense. This condition was so discernible that he could readily pick out the sections in which the lime was used by observing the difference in the finish of the road surface. There was an apparent lack of laitance, and a uniform wearing of the surface. There were no signs of checks, or of transverse or longitudinal cracks. On adjacent sections, where lime was not used, there were transverse cracks. Apparently the hydrated lime had a tendency to reduce the effect of temperature changes, and thereby to prevent cracking.

In a report on a road built at Accident, in the fall of 1914, Mr. L. T. Downey, resident engineer, stated that it was found by experiment that with a medium wet mixture small cracks appeared in the pavement, but in a wetter mixture this was not noticeable. He attributed these cracks to the stone absorbing moisture. The addition of 10 per cent by weight of hydrated lime to the Portland cement seemed to give density to the mixture; the men on the strike board observed that it was harder to pull the board when lime was used. The lime gave the mixture a richer appearance, and it apparently retarded the setting somewhat. By December 8, 1914, cracks other than joints seemed to be fewer on sections where the lime was used than on other sections of the road.

Similar experiments have been made by the United States Office of Public Roads, and by the United States Bureau of Standards, upon the effect of hydrated lime in cement mortars.

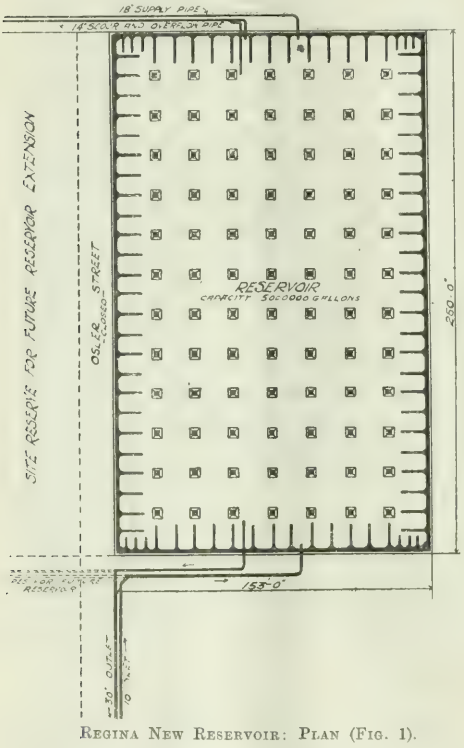
Trade Wastes Disposal Charges.—Ossett Town Council have confirmed a recommendation of the Sanitary Committee that for the disposal of trade refuse the following charges should be made in respect to the effluents of special trades: Fellmongers, 3d. per 1,000 gallons; tripedressers, 5d.; piggeries, 4d.; slaughterhouses, 3d.; collieries, 2d.; cab proprietors, tramways, railways, laundries, and mineral water manufacturers, 1½d.; gasworks, 3d.; leather curriers, 3d.; and coke washers, 2d.

Steam Roller Conversion for Traction Purposes.—In a report presented on Wednesday the Works Committee of Camberwell Borough Council stated that the borough engineer, Mr. W. Oxtoby, had reported to them that at the present time there was considerable difficulty in getting the number of men and horses required for the various services of the council, and especially for the cartage of material, and he had suggested that for traction purposes one of the council's steam rollers should be fitted with tractor wheels. Such wheels could be supplied and fitted at a cost of about £100 and it was believed that the cartage of material to the southern portion of the borough by the use of horse labour would be considerably reduced. The committee had therefore authorised the borough engineer to have tractor wheels fitted to the steam roller, with the necessary accessories.

The City Reservoir, Regina.

By R. O. WYNNE-ROBERTS, M.INST.C.E., M.CAN.SOC.C.E.

The part of Boggy Creek watershed from which the City of Regina, Saskatchewan, obtains its main supply of water is about 72 square miles in area, and the nearest point is about 6 miles distant as the crow flies or 8 miles by road. The watershed has a pear-shaped boundary, the narrowest and lowest point being at the south-west corner, where the city owns land. On this land about forty-five artesian wells have been sunk under the writer's advice. The water in all cases overflows the surface, and is collected and conveyed by underground pipes to Barton pump well, which has a capacity of 270,000 gallons In a pump-house adjacent to the well there are two 80-h.p. Crossley oil engines, and two 2,000,000 gallons per day



Regina New Reservoir: Plan (Fig. 1).

turbine pumps to raise the water to Tor Hill reservoir. This reservoir has a capacity of 5,000,000 gallons, is built of reinforced concrete, circular in plan, 202 ft. in diameter, 25 ft. deep, and stands about 90 ft. above the pumps and about 120 ft. above the city street level. The water is conveyed from this reservoir to the city by an 18-in. steel main, which has a maximum delivering capacity of about 3,500,000 gallons per diem.

In an adjoining section are located a number of springs yielding from 400,000 gallons upwards, according to the season. This constituted the only source of supply for the city until 1911, and was quite inadequate. This water is conveyed by 15-in. vitrified pipes to a basin half way to Regina, and thence by a cast-iron main partly 12 in., but principally 10 in., in diameter. The present total yield is from 2,500,000 to 3,000,000 gallons per day, but it is estimated that Boggy Creek area will yield up to 4,000,000 or 5,000,000 gallons per day by extending the collecting lines and sinking additional wells.

The 10-in. supply is pumped into the city mains by an electrically driven turbine pump, but the 18-in. ordinarily affords a gravity pressure of 45 lb. per square inch. When the demand is great and the pressure is diminished, then the water is pumped by a 5,000,000 gallons per day Escher Wyss turbine pump driven by a Bellis & Morcom high-speed steam engine.

ADDITIONAL SUPPLY.

The writer some time ago reported to the city council on the question of additional water supply, and recommended the adoption of a scheme which involved the taking of water from five watersheds contiguous to Boggy Creek, making a total area of about 200 square miles, and estimated to yield about 10,000,000 gallons per day. This scheme can be carried out piecemeal provided the initial works are properly laid out. A part of the scheme was a 27-in. steel main to tap the Silver Stream area, with a branch to Tor Hill reservoir. As the existing mains from Boggy Creek were delivering the maximum quantity on gravitation pressure system, it was deemed desirable to lay the part of the 27-in. main from Tor Hill reservoir to the city so as to supplement the quantity and pressure. The cost of the pipe line was estimated at about $508,000 [£101,600], which was a large amount to incur under the prevailing financial conditions. As a city reservoir would be necessary, even with such a main, City Works Commissioner Thornton considered that the reservoir would suffice for the time being. The supply to the reservoir is from the 10-in. line, and the night surplus from the 18-in. main.

Having considered all points of the scheme, it was decided to build the reservoir. There are two sites available—one near the cemetery, on which a duplicate of the Tor Hill circular reservoir could be constructed, and the other a piece of land near the power-house. Having regard to the convenience of a reservoir near to the power-house, and the obviation of the cost of laying a large main from the other site, the power-house site was selected. This land, however, was limited, and did not permit of embankments; consequently the writer designed a rectangular basin covering the entire site and part of a closed street, the length being 250 ft., width 153 ft., water depth 22 ft., and the capacity 5,000,000 gallons, which was estimated to cost about $125,000 [£25,000], exclusive of the land (see plan). Reservation was made for a duplicate reservoir to be built in the future.

GENERAL DESIGN OF NEW RESERVOIR.

The site was practically level, and, as it was advisable to assure a constant head on the turbine pumps, most of the reservoir had to be built above ground. The floor level is 6 ft. below the ground surface, and the top water line about 16 ft. above. The work will be described in the order of construction.

EXCAVATION.

It was intended to excavate the ground by machine, but to afford more employment it was done entirely by manual labour. The excavation extended about 1 ft. beyond the wall lines, and to an average depth of 7 ft. 4 in. The material was entirely gumbo clay.

FLOOR.

The floor, for a distance of 22 ft. inwards from the walls, is 20 in. thick; the central portion is 12 in. thick, and under each column 20 in. thick. The reinforcements consist of ¾-in. rounds at 12-in. centres in the lower part of the thicker concrete near the walls, and these bars extend 8 ft. up the walls to form the necessary tie; ½-in. round bars are also laid within 6 in. of the surface at 6-in. centres in two directions. These bars are tied with wire at every fifth intersection in one direction, and at every intersection in the other. The column bases have an extra layer of ½-in. bars at 12-in. centres in the lower portion. The concrete was laid to the level of the bars, and when these were placed the next portion of concrete was poured on, and finally a 2-in. finishing coat of fine concrete laid and trowelled to a close-textured surface. There is a fall of 1 ft. from one end to the other of the floor, and a small fall from the sides to the major axis.

WALLS AND COUNTERFORTS.

The walls are 33 in. thick at the base, with an addition of a splay on the inside of 36 in. There is a set-back on the outside of the wall at the ground surface, and here the concrete is 14 in. thick, and at the top 10 in. thick (see Fig. 2). The external faces are vertical, but on the inside there is a batter of 11 in. in a height of 23 ft. There is an overhanging

coping on top with a sloping surface to shed the water. The set-back and overhanging coping of 12 in. will be the base and finish respectively of a cellular tile wall, which will be explained further. The counterforts are 14 in. thick, and are located on the line of beams and intermediately, and their bases extend into the reservoir for 11 ft. 6 in., and finish at 9 in. above top water level, the projection there being 12 in. The counterforts at the corners are smaller to

thickness of the walls, and a uniform load equivalent to the varying depths of water. The horizontal reinforcements are round bars varying in diameter and spacing to correspond approximately to the area of steel required—at the base there are ¾-in. bars at 3½-in. centres, and at the top ⅝-in. bars at 4-in. centres (Fig. 2). These bars were cranked at the necessary distances and the ends bent. As it was too troublesome a work to change the cranking frequently, owing

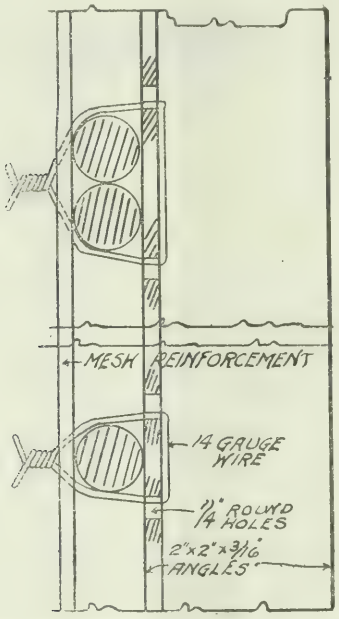
admit of circulation of the water. The extreme corners were filled in solid to avoid complicated form work, &c. At the connections of counterforts with the wall 6-in. splays are provided. Spaces were left in top of walls to receive beams, &c.

The reinforcements were calculated on the assumption that the walls between the counterforts were acting as simple beams, having depths equal to the

to the reduced thickness of the wall, the changes were made at six points. The counterforts were calculated as cantilevers hinged at the base of the wall, and tied to the floor at the toe, and are horizontally reinforced at the same spacing or multiples thereof as the wall, but the diameters are less. The tension bars connecting the toe to the floor consist of nine 1⅛-in. rounds linked round bars of the same diameter, inserted

crossways in the floor concrete. These bars extend upward for one-third the height; there the number is reduced to four, and from two-thirds height to top there are two ⅜-in. rounds. The overlaps are 2 ft., and the ends of bars all bent. The horizontal bars connecting the tension bar to the wall are bent into horizontal hooks to slip over the tension bar, and vertical bends to fall over the wall bars. There are ½-in. rounds at 12-in. centres vertically connecting the counterforts with the floor. To provide for temperature stresses continuous triangle steel-mesh reinforcements are inserted within about 3 in. of the outside face.

As it was most important that the horizontal wall reinforcements should be placed where designed and held there during the process of concreting, the writer adopted practically the same method as on Tor Hill reservoir. Vertical standards, consisting of 2-in. by 2-in. by $\frac{3}{16}$-in. angles, are located one at each buttress and two between. Two holes were drilled on one



Regina New Reservoir: Section showing Method of Fastening Horizontal Rods (Fig. 3).

web to receive each bar, and a soft wire was inserted through the two holes to bend the bar in place at the required distances apart (Fig. 3). This method fixed the bars permanently, and although men climbed up and down, no movement took place. The reinforcements and supports gave the impression of a secure steel basket work. All overlaps of wall reinforcements took place at junction of the counterforts with the wall.

COLUMNS.

The eighty-four columns are 18 ft. 9 in. apart in one direction, and 19 ft. ⅜ in. in the other, and are 16 in. square, resting on pyramidical bases, and the height from the top of the base to the underside of the beams is 21 ft. 9 in., or slightly over sixteen times the least dimension. It is somewhat difficult to assure true alignment and perpendicularity for a vertically cast column of this height, and to prevent any bending the reinforcement consisted of 2-in. by 2-in. by $\frac{3}{16}$-in. steel angles tied together by 1-in. by ⅛-in. flat iron riveted at 24-in. centres, which proved to be very satisfactory.

ROOF.

It was intended to construct the roof entirely of reinforced concrete to carry a live load of 200 lb. per square foot, and careful designs were prepared for this purpose, but, owing to a suspension of the work caused by financial disturbances due to the European political situation, much time was lost, and it was necessary to adopt a quicker method of construction. Consequently steel joists were substituted for the reinforced-concrete beams. The primary beams run across the reservoir, and the secondary beams lengthwise. The primary beams are 18 ft. 9 in. long, and rest on the columns, and the secondary are 19 ft. ⅜ in. less thickness of primary web and are secured together by standard angle connections. The secondary beams are 6 ft. 4 in. apart. The roof concrete floor is 5 in. thick, rests on the steel beams, and is reinforced with No. 31A continuous triangle steel mesh 54 in. wide, with overlaps of 4 in. Manhole covers at each end and four ventilators were inserted in the roof. The roof has a fall of 12 in. from the middle to the ends, and rain-water outlets are provided to carry off the surface water. The roof beams and concrete are disconnected from the walls by a thick layer of felt, so as to obviate any stress induced by temperature contraction or expansion being applied to the walls.

WATERPROOFING.

No waterproofing compound was used with the concrete, but when the walls were dry a thick layer of hot liquid bitumen was painted on, and this was afterwards coated with neat cement cream. This process was found to be effectual in the Tor Hill reservoir, and was again applied in this case. The roof will be coated in a similar manner.

CONCRETE MIXTURES.

The cement was supplied by the Canada Cement Company, and the gravel was obtained from the city gravel pits supplemented by some screened gravel from the neighbourhood. The pit gravel was tested before the work was started, and found to be fairly uniform. No screening was done. There are railway spur tracks at each end of the reservoir which were found to be very convenient, for the gravel was shovelled into the hopper, cement added, and the whole mixed by Ransome mixers. Five bags of cement per cubic yard of gravel were used in the floor, 6 bags in the walls, 8½ bags in the columns, 8 bags in the roof, and 6·3 bags per cubic yard in the floor finish.

DRAWINGS.

The drawings were so prepared that the nature of the reinforcements in every part of the work could be seen—that is, the position of the cranks, bends, overlaps, &c., were shown, and the number of bars, diameters, lengths, and weights were given. When the work was being carried out the cranked bars fell into their allotted places and then were fastened by wire. The work proceeded methodically from start to finish, and doubtless this contributed considerably to the economies effected, for there was very little loss of labour and materials.

PLACING CONCRETE.

As the concrete was mixed it was conveyed in ordinary two-wheel tipping concrete carts over runways erected from time to time in the most convenient positions. Men were employed in slicing the concrete in place, and care was taken to assure that the steel was properly covered.

DRAINS.

An 8-in. sewer pipe was laid outside the base of the walls to remove any water that may collect there, and to conduct the rain water to the sewer.

TILE FACING.

As the land occupied by the reservoir was limited and expensive, it was essential that the fullest possible use should be made of it. Consequently embankments had to be eliminated and the walls supported internally; hence the reason for using counterforts. Owing to the absence of external protection, such as would be obtained by embankments, steps were taken to insulate the wall against temperature in another manner. After due consideration, the method that was deemed expedient was the construction of an external cellular tile facing. Ties have been left on the outside of the concrete walls to bind the tile facing to it. The facing has been designed to produce a pleasing effect by providing pilasters and recessed panels. The winter arrived before this work could be undertaken, and consequently it was held over until the coming spring weather.

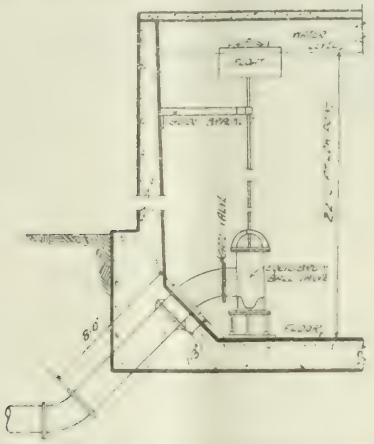
IRONWORK.

Inlets.—There are two inlets, one at each end, one 18-in. and one 10-in.; this is because of local conditions. Each inlet is provided with a sluice valve on the outside of the reservoir, and a Glenfield & Kennedy equilibrium ball valve which will control the height of water at any predetermined level. As previously mentioned, the 18-in. inlet will discharge the surplus night flow, and to assure the city a pressure, a Glenfield & Kennedy loaded equilibrium valve with by-pass has been inserted on this main, and so ad-

justed that no water will discharge into the reservoir until the main pressure has exceeded a fixed point. In other words, the equilibrium valve will act as a relief, and when the water level has reached a definite position, the ball valve will shut off the supply. (Fig. 4.)

Outlet.—There is one 30-in. bell-mouthed outlet at the upper end of the reservoir, and this is connected to the pumping plant in the power-house close by. All valves on this line are 24-in., with taper pipes at each end.

Overflow and Scour.—These are located at the lower end of the reservoir. The overflow pipe has a bell-mouth top, and is 22 ft. 6 in. above the floor at that point. It is secured to the wall by 4-in. by ¼-in. steel stays. The scour pipe also [illegible]



Regina New Reservoir: Elevation of 18-in. Outlet (Fig. 4).

Scale ½ in. to 1 ft.

situated in a sump 3 ft. deep. The overflow and scour run into one pipe outside the reservoir, where the valves are placed. (Fig. 5.) Additional valves are provided with chambers. Ladders are constructed of 4-in. by ½-in. steel stringers and ¾-in. rungs 15 in. apart and 18 in. long.

Puddle Rings.—All cast-iron pipes, bends, &c., inserted in the concrete work were provided with 6-in. by 1-in. puddle rings cast on with brackets, with the view to preventing water seeping along the pipework.

POWER-HOUSE CONNECTIONS.

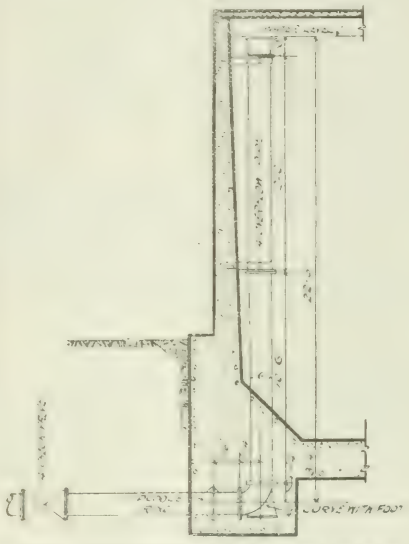
Inasmuch as it was important to provide adequately for fire extinction, the writer advised that the connections between this city reservoir and the pump should be made as large as possible, to suffice for some years, and in the interval the additional 27-in. main from Tor Hill reservoir, already referred to, would doubtless be constructed.

The basis of the calculation in connection with computing the quantity of water required for fire extinction purposes was the formula suggested by the American National Board of Fire Underwriters, which is—$Y = 850\sqrt{X}(1 - 0{\cdot}01\sqrt{X})$, in which Y represents imperial gallons per minute, and X represents the population in thousands.

The pipe arrangement at the power-house consists of one 36-in. supply main, fed by the 18-in. main from Tor Hill reservoir, and 30-in. pipe from the city reservoir, and one 36-in. delivery main; these are parallel and only a few feet apart. When the gravity supply and pressure from the 18-in. main is ample (supplemented by the 10-in. supply, which hitherto had to be pumped) the water passes direct into the 36-in. delivery main; otherwise all water is conducted to the supply main and pumped at city pressure into the 36-in. delivery main. There is an outlet from the 36-in. delivery leading into a warmed underground chamber under the footway, and there it is divided into three distributing mains, 24-in. to south-east district, 24-in. to south-west district, and an 18-in. to the north district. Each of these distributing mains is so arranged that the connections in the chamber will allow one, two, or three of the branches to be used simultaneously. On each branch there is a Glenfield & Kennedy pressure regulating valve, which can be adjusted to any pressure, and each main has a Simplex Venturi meter. The pressure-regulating valves are normally out of commission, but when a fire occurs in any district, two of the pressure regulators are put into action by simply opening small taps near the pump, and thus the fire pressure produced by the pumps is concentrated on the district from which the alarm was received. These regulators have lever arms carrying the weights which fix the outlet pressure, and the piston connected to the free end of the lever is operated by the outlet pressure, causing it to rise or fall, and in doing so an indicator in the power-house is moved correspondingly, and thus the operating engineer can see at a glance what is taking place.

Each Venturi meter is connected to the power-house by two wrought-iron pipes, which conduct the main pressure and the throat pressure to the recorder which indicates the rate of flow, records on a chart the varying flows, and also shows by a counter the total quantity discharged.

The credit for the neat and simple contrivance



Regina New Reservoir: Elevation of 18-in. Overflow Pipe (Fig. 5).

Scale ½ in. to 1 ft.

installed in connection with the regulator valves and Simplex Venturi meters is due to Mr. T. H. Smallwood.

FORMS.

The wall forms consisted of 1-in. by 8-in. sheeting, supported by 2-in. by 4-in. uprights at 24-in. centres, tied and strutted to forms on the opposite face by soft wire. The counterforts were formed in a similar manner, except that the sloping face had 2-in. by 8-in. and splays 2-in. by 10-in.

The runways were built of 6-in. by 6-in. verticals, 4-in. by 6-in. horizontals, and 2-in. by 12-in. surface boards.

COST.

As already stated, the estimated cost of the reservoir and connection was $125,000 [£25,000]; the reservoir alone was estimated to cost $110,000 [£22,000], and the connection the balance. The total actual cost of the reservoir was $78,514 [£15,703], and the pipe connections $14,951 [£2,990], making a total of $93,466 [£18,693], or $94,657 [£18,931], inclusive of sundry expenses, so that a saving of at least $30,343 [£6,069], which is equal to 23·2 per cent on the estimate, was effected by carrying out the work under the direct control of the waterworks department.

The city works commissioner (Mr. L. A. Thornton) took an active interest in the work, which was managed by Mr. J. M. MacKay, the waterworks superintendent. Mr. H. Gibson had charge of the execution of the work, and Mr. I. Ormond Riddell was the resident engineer, and Mr. Theo. Brockmann checked the design.

BUILDING REGULATION IN SHANGHAI.

By Charles H. Godfrey, M.Inst.C.E.,
Municipal Engineer.*

The past year constitutes a record in the local building trade, permits having been issued for the erection of 8,824 structures, of which 7,869 are Chinese houses, the greatest number of structures previously erected in any one year being 5,411 in 1906. Over 60 per cent of the houses erected have been built on undeveloped land, principally in the western district. Owing to the unprecedented boom in the building trade a very large number of "mushroom" contractors have made their appearance, many of whom have previously been clerks or small "jobbing" contractors, and consequently without practical experience, usually relying upon guesswork or the doubtful ability of a foreman to work out their estimates, which in many cases are cut so low that it is impossible to properly carry out the work without serious loss, unless very inferior materials and cheap labour are employed. The energies of the building inspection staff have been directed to counteract this as far as possible—an attention which is frequently misunderstood. The inspectors, in addition to undertaking the duties of clerks of works, are, on occasions, called upon by the building owners to bring pressure to bear on the contractor to enforce the proper execution of work, and in more than one instance a request has been made to the department for a report upon the quality of the work done before further payment on account is made to the contractor.

It is worthy of note that the hostile attitude of the local Chinese towards the amended building rules, which were framed with the object of decreasing the number of nesting-places for rats in Chinese houses, has almost disappeared, and in a great number of cases it has not been difficult to persuade building owners to also omit the ceilings—always a favourite run for rats—to the ground-floor rooms, although the "ratproofing" by-laws do not call for this to be enforced.

There is still a growing tendency to embody features of a foreign-style house in those of Chinese construction, chiefly in the dividing up of the hongs and better-class houses into small rooms with open fire-places, and the introduction of very ornate wooden panelling and cornice moulds; the old-fashioned dignified interior of a first-class Chinese house is now very rarely met with in those of modern design. If this transitional state develops much further, radical changes will have to be made in the building rules to ensure the stability of the ordinary Chinese dwelling-house.

JERRY-BUILDING.

Formerly it was the universal custom to employ not less than five upright Foochow poles, carried to the roof, filled in between with 3-in. bricks, to divide each house of an approximate width of 12 ft. At first two poles were omitted, but at present very often only two upright posts—one at either end of the division wall—are used, with the result that the division or partition wall is considerably weakened, and also—what is more to the point to the speculative builder—the cost per house is greatly reduced. A large proportion of the jerry-building which is met with is on leased land; the lessee, naturally, perhaps (knowing that the houses which he is building will revert to the lessor at the expiry of his lease), puts up the cheapest class of property permissible under the building rules, caring little for the comfort or safety of the tenants, so long as he is able to get as large a return as possible on his outlay.

The present extraordinary activity in the building trade has shown more clearly than ever the great necessity for new building rules of a far more stringent character than has hitherto been considered necessary. It is evident from the examination of many of the old buildings, both foreign and Chinese, that the standard of workmanship has been very much lowered of late years, and as the settlement increases it is only reasonable to assume that unless checked it will sink still lower, particularly if the seemingly popular system of leasing land for a number of years to speculative Chinese builders continues. The need for by-laws governing the erection of Chinese theatres, cinema halls, hotels, Chinese lodging-houses, and similar buildings used by the public is very urgent, the more so because the number of "Chinese architects" without experience in design or construction is rapidly increasing, and although the council has the power to refuse to license any such building unless provided with adequate means of exit for the escape of the inmates in case of fire, the applicant for a permit to erect a building frequently feels, upon being requested materially to amend his plans, that he is being harshly dealt with. A very great deal of unnecessary labour and vexation to both the architect, the building owner and the public works department might easily be avoided if, in cases where the building owner is doubtful as to the conditions under which a licence will be granted, sketch plans of the proposed building were first submitted to the council for suggestions with regard to exits and other important details instead of, as would seem to be the custom, first preparing finished drawings, obtaining estimates, and, in many cases, actually settling the contract before applying for a permit.

The increasing use of reinforced concrete in the construction of many large buildings forms a new era in the local building trade, and in the interest of property owners and the public generally, by-laws regulating the construction of this particular class of building need to be introduced and rigidly enforced. The absolute necessity for expert supervision is apt to be overlooked, and that, together with the inexperience and carelessness of the average Chinese labourer, constitutes a grave danger, as, although the design as approved may be correct, when once the rods employed in the construction are covered it is almost impossible to detect bad work until unexpected cracks or more serious defects make their appearance.

* Extract from annual report

FIRE PROTECTION AT CHISWICK.

The equipment and *personnel* of the Chiswick Fire Brigade are the subject of a short but interesting report just issued by Mr. Edward Willis, the engineer and surveyor to the urban district council. The brigade is composed principally of volunteers.

Including sixty-three fixed by the Metropolitan Water Board, there are available for use in the district for fire-extinction purposes 412 hydrants. This, Mr. Willis points out, is equal to three per acre, or ten per 1,000 of population—a number which, he thinks, will compare with the majority of urban districts throughout the country, considering their favourable position in relation to the area covered with buildings.

An extension of fire alarms is looked for now that the council have decided on the employment of a permanent fireman electrician.

Attention is drawn in the report to the fact that a number of spans of wire communicating with the station are unduly long. Dealing with this point Mr. Willis says: "The principle of numerous wayleaves is not one to be advocated, as the tendency of owners is, not unnaturally, to attribute any defects in the watertightness of their roofs to damage caused by the contractor or the council's servants in repairing or maintaining the overhead wires, and I would again emphasise the advisability of gradually lessening the long spans and substituting overhead pole lines or underground wires with a view to greater efficiency and ultimate economy, with a corresponding reduction in complaints."

Owing to the fire engine being a horse-drawn appliance £136 yearly is spent on the hire of horses. It appears that the motor fire escape in the possession of the brigade usually reaches the scene of a fire first, and the surveyor looks forward to the time when a motor fire engine will be provided. He estimates that this, in addition to adding to the efficiency of the department, would result in a saving of at least £100 per annum. At the same time he suggests the purchase of a motor engine carrying a light fire escape and chemical engine, or a modified first-aid apparatus attached to the motor pump.

Boston Electric Lighting.—The Boston Town Council have this week received an intimation from the Board of Trade that the Provisional Order for the supply of electricity to Boston and district has been granted.

Lincoln Corporation Bill.—The Lincoln Corporation Bill, which is now being considered by the Local Legislation Committee of the House of Commons, seeks power to acquire and extinguish the rights of the freemen and others in respect to the commons; to run trolley vehicles and motor omnibuses; to make further provision with regard to the supply of gas and electricity; and with regard to the health, local government, and improvement of the city.

REPLANNING AND REDEVELOPMENT IN EXISTING AREAS.

IMPROVEMENTS IN THE LARGER CENTRES.

In his recent paper to the Town Planning Institute on the subject of the replanning and redevelopment of existing areas—some extracts of which appeared in our issue of the 23rd ult.—Mr. W. T. Lancashire, M.INST.C.E., the city engineer of Leeds, furnished some interesting particulars of the work done in a number of large towns. The information in question, which was supplied by the engineers of the several municipalities, and which formed an appendix to Mr. Lancashire's paper, is reproduced below:—

Town.	Assessable value	Amount produced by penny rate.	Cost of street widenings and improvements during last 20 years.	Replanning of built-up areas other than those necessitated by street widenings.
Birmingham ...	£4,853,184 (estd. 1915).	£16,500	Nearly £1m. has been spent on the purchase of property in the past 14 years.	One scheme in respect of a crowded and insanitary area in centre of city was carried out under the Artisans' and Labourers' Dwellings Act. Area 4½ acres. Cost £1,700,000. A scheme under Part 1, Housing of Working Classes Act, 1890, has been carried out at a cost of £16,100.
Bradford ...	£1,100,472	£5,940	£2,250,671	Replanning portion of city known as "central area" projected at the present time by reason of railway company's extension through the centre of the city. Area 10a. 3r. 7½p. Estd. cost approx. £800,000. Amount spent on schemes under Part 1, Housing of Working Classes Act, 1890=£44,500. Estimated cost of proposed schemes, £21,000.
Bristol ...	Borough rate, £1,785,068. District rate, £1,768,854.	£7,100	Approx. £1,000,000.	None.
Hull ...	£1,370,227	£5,458	Improvements referred to in next column with main road widenings cost approx. £125,000.	Central area was practically remodelled between 1896 and 1908. Proposed scheme under Part 1, Housing of Working Classes Act, 1890, laying out and providing workmen's dwellings in condemned area of 21,000 square yards. Estimated cost £107,270.
Leeds ...	£2,225,[illegible] (City rate).	£9,200	About £2,500,000.	Two unhealthy areas (66½ acres), cost to date about £853,150, including purchase of properties and part of cost of re construction. Sovereign-street area (8 acres), clearing congested area, filling up offensive goits and replanning. Infirmary area, joint Infirmary Board and Corporation scheme (8 acres), demolition of slum, infirmary extensions and relaying out.
Leicester	£1,[illegible]	£4,096	—	None.
Liverpool ...	Poor rate purposes, £4,[illegible]. General rate, £4[illegible].	£15,800	£5,000,000.	Various small areas rearranged and rebuilt for dispossessed tenants. 19,230 court houses have been demolished since 1864. Actual cost £1,162,465. Deficit chargeable on rates about £[illegible] net cost.
Manchester ...	£[illegible]	£18,245	Upwards of £[illegible] since 1868.	Several schemes have been carried out under Housing of Working Classes Act, 1890, Parts 1 and 2.
Newcastle-upon-Tyne ...	£1,712,[illegible]	£6,841		None.
Nottingham ...	£1,[illegible]	£4,080		Now clearing a "slum" area, laying out same with widened streets and building on a portion of site houses for accommodation of people disturbed. Area 7¼ acres. Estd. net cost £132,000.
Sheffield ...	£1,[illegible]	£7,677 approx.	Approx. £2,[illegible] during last 25 years.	Clearance of an "insanitary area"—*i.e.*, demolition of old and insanitary property and building thereon flats, &c. Area 23,908 square yards. Cost to date about £150,000. No further schemes are contemplated.

Liverpool. Cost of construction of new wide streets through unbuilt land averages £10,000 per mile.

Cost of construction of new wide streets through built-up areas on outskirts, £80,000 per mile.

Cost of construction of new wide streets immediately outside central area, £400,000 per mile.

In answer to the following enquiry: "Have you any general plan of contemplated street widenings or improvements in or about the centre of the city, or do you deal with them in detail as occasion necessitates?" none of the above towns appears to have a general plan of this nature. Special Parliamentary powers are obtained from time to time.

Dangers in the Use of Paint.—The Departmental Committee which has investigated the dangers attendant on the use of paints of which lead is a part issued their report on Wednesday. They recommend that a law should be introduced prohibiting in this country the importation, sale or use of any paint material which contains more than 5 per cent of its dried weight of a soluble lead compound, with necessary exemptions for certain special classes of colours, such as those used by artists. To permit adequate time for the arrangement of supplies of non-poisonous material, the committee recommend that the restrictive legislation be not brought into force until three years after the date of their report.

KILLED IN ACTION.

BIRMINGHAM OFFICIAL'S DEATH AT THE FRONT.

Captain Fountain O. C. Nash, of the 5th Battalion (Territorials) of the Northumberland Fusiliers, chief town planning assistant in the Birmingham city surveyor's department, has been killed in action, we regret to state. The news was made known at the council house on Friday last, we learn from the *Birmingham Post*, and it was received with regret, for during the time Mr. Nash had lived in Birmingham he had gained the respect and esteem of all.

Mr. Nash was the son of an artist and the grandson of the author of the "Famous Homes of England." He was for some years engaged as assistant in the Rochdale Borough surveyor's department, and afterwards became surveyor of Cockermouth, a post which he relinquished on obtaining an appointment at Newcastle-on-Tyne. In November, 1913, he was appointed chief town planning assistant in the department of the Birmingham city surveyor. He was a smart and able official, and made a good impression in the town planning department, where his ability as a surveyor and architect was speedily recognised by the Town Planning Committee and all who were associated with the development of the schemes of town planning. When the war broke out he was called up to his regiment, for he had been actively identified with the 5th Battalion (Territorials) of the Northumberland Fusiliers for some few years, and he went with his battalion on active service as a captain. Captain Nash had always taken great interest in military work, and had qualified in musketry and in various other subjects, and he had also passed the School of Instruction for rank of field officer. Captain Nash, who lived at Moseley, and was about thirty-four years of age, leaves a widow and two children.

Society of Architects.—A meeting of this body will be held on Thursday next at 28 Bedford-square, W.C., to consider a draft of the proposed model general conditions of contract to be recommended by the society for use in connection with building works. The chair will be taken at 7.30 p.m.

SOME RECENT PUBLICATIONS.*

Heating and Ventilating Buildings. Sixth edition, revised and rewritten. By R. C. Carpenter, M.S., C.E., &c. Price 15s. nett. New York: John Wiley & Sons, Inc. London: Chapman & Hall, Limited.

The first edition of this manual for heating engineers and architects was published twenty years ago, and its popularity is evidenced by the fact that since that time five complete editions have been printed and sold. The importance of the subject has been increasingly recognised in recent years, which have consequently witnessed considerable scientific development. The present edition has therefore been thoroughly revised and largely rewritten so as to bring it up to date. The author summarises the purpose of the book as being to present, in as clear and concise a manner as possible, first, a statement of the general principles of pure science which apply; second, a discussion of data and results of important investigations for showing the application of rational principles to practical construction; third, the various practical methods employed in heating and ventilating buildings; fourth, the methods of designing various systems of heating and ventilating; and, fifth, a collection of useful tables for practical application of the principles stated. These objects have been well achieved, and the result is a practical treatise which can be confidently recommended to those interested in the important topics dealt with.

Surveying and Levelling Instruments. By W. F. Stanley. Fourth edition revised by H. T. Tallack. Price 7s. 6d. London: E. & F. N. Spon, Limited.

The vast and unique experience of the late William Ford Stanley in the design and construction of surveying instruments was sufficient to insure the success of the first edition of this book, which appeared in 1890. Subsequent editions contained various improvements, and the new edition has been thoroughly revised by Mr. Tallack, who actively co-operated with Mr. Stanley in bringing many of the instruments described to their present state of perfection. In no other work, so far as we are aware, is the subject dealt with on so comprehensive a scale. The descriptions of the several instruments are both theoretical and practical, while the technical principles are made clear by illustrations of such parts of important instruments as cannot be seen from the engravings of the instruments as a whole. The work is both complete and authoritative.

The Panama Canal. By R. E. Bakenhus, S.B., H. S. Knapp, and E. R. Johnson, PH.D., SC.D. New York: John Wiley & Sons, Inc. London: Chapman & Hall, Limited.

This work deals with the history and construction of the Panama Canal, and also with its relation to the Navy, international law, and commerce. The book is divided into six parts, the several titles being: Historical; The Route—the design and construction; Sanitation; Costs of Work Elements of Success; Conclusion; the Navy and the Panama Canal; the Panama Canal in International Law; and Commercial Importance of the Panama Canal. The several articles comprised in the book were originally published in the "Proceedings" of the United States Naval Institute. They are now revised and consolidated into a single work, which, without going into unimportant detail, enables the reader to obtain some grasp of the meaning of this enormous enterprise.

The Design of Steam Boilers and Pressure Vessels. By G. B. Haven and G. W. Swett. Price 12s. 6d. nett. New York: John Wiley & Sons, Inc. London: Chapman & Hall, Limited.

In this book the authors, who are professors of machine design at the Massachusetts Institute of Technology, give a connected account of the principles of boiler design. The work is designed, as far as possible, to further the use of rational methods, and to this end the use of empirical rules has been avoided, except where absolutely necessary. The first three chapters are devoted to the elucidation of principles and formulæ, which are applied in the later part of the book to the practical design of various types of boilers and pressure vessels. The book is one which should be appreciated by the specialist in this class of work.

Spons' Architects' and Builders' Pocket Price-book for 1915. Edited by C. Young and S. M. Brooks, FF.R.I.B.A. Price 2s. 6d. nett. London: E. & F. N. Spon, Limited.

As a price-book which is really suitable for carrying in the pocket, this work will be found very useful. The present is the forty-second edition, and contains much new matter. In addition, all the prices have been revised, while the section dealing with the hire of builders' plant has been entirely recast. It is pointed out in the preface that, in consequence of the war, markets vary considerably from week to week, but the prices given are in accordance with the cost of material at the time of going to press. The editors appear to have succeeded once more in producing a thoroughly useful, practical and reliable price-book.

Air, Water and Food. By A. G. Woodman and J. F. Norton. Fourth edition, revised and rewritten. Price 8s. 6d. nett. New York: John Wiley & Sons, Inc. London: Chapman & Hall, Limited.

In this book the authors deal with the subject "from a sanitary standpoint"—that is, from the point of view of hygiene. The work is principally concerned with analyses for the detection of impurities and adulteration. It has been carefully revised so as to incorporate recent advances in analytical methods.

*Any of the publications reviewed, or referred to as received, will be forwarded by the St. Bride's Press, Limited, on receipt of published price, plus postage in the case of nett books.

Irvine Water Supply.—An enquiry has been held at Glasgow under the Private Legislation Procedure (Scotland) Act in connection with the Provisional Order promoted by the Irvine and District Water Board for the purpose of extending their reservoir accommodation at Knockendon and filtering works at Greenhead.

Sewers Damaged by Trade Wastes.—A discussion took place at a recent meeting of the Upper Stour Valley Main Sewerage Board regarding the alleged liability of Halesowen Rural Council for damage to a sewer at Belle Vale, Halesowen. The board alleged that the damage was caused by tipping over the land. The rural council denied liability. It was decided to appoint a sub-committee to confer with the Halesowen Council upon the matter.—It was reported that manufacturers' waste fluid was having a damaging effect upon the sewers in certain districts, and the engineer was directed to make enquiries.

Irish Housing Schemes.—On Saturday last, in the House of Commons the Chief Secretary for Ireland was asked if it would take the three Local Government Board inspectors appointed for the purpose of holding local inquiries respecting housing schemes under the Labourers (Ireland) Acts lodged with the Local Government Board two years to complete their work; and, if so, whether he would consider the advisability of appointing additional inspectors to hurry the work through and enable the schemes to be completed without further delay. Mr. Birrell stated that at the present moment the Local Government Board were in correspondence with the Treasury on the subject of the limitations to be placed on the funds required for pending schemes, but it was certainly not in contemplation in the existing circumstances to appoint additional inspectors for the purpose mentioned.

Cost of Cottage Building in Ireland.—In the House of Commons on Saturday last the Chief Secretary to the Lord Lieutenant of Ireland was asked whether the Local Government Board for Ireland would grant supplemental loans to rural district councils to meet the extra cost per cottage caused by the councils being compelled, owing to the rise in the price of building material and the difficulty of securing contractors for the work, to pay more per cottage than the maximum sum at present allowed; and whether the Board, in view of the difficulty experienced by councils in getting contractors to carry out the work, would consider the advisability of increasing the maximum amount allowed per cottage. Mr. Birrell said the practice of the Local Government Board had been when the cost of a cottage exceeded the loan sanctioned out of land purchase funds, to permit the local authority to obtain a supplemental loan in the open market, and this practice might still be pursued in particular cases. The board, however, were not prepared at this juncture to alter their settled policy of limiting the amount of the advance out of land purchase funds for each cottage and plot.

PREVENTION OF CORROSION.

To the Editor of THE SURVEYOR.

SIR,—I note it is stated in your report of the paper presented by Mr. W. H. J. Binnie, M.INST.C.E., F.G.S., on the "Corrosion of Iron and Steel," read before the Institute of Sanitary Engineers, that the treatment of pipes with bitumen or hessian and bituminised stockinette prevents corrosion.

All the materials, however, I have met with up to the present have been practically mixtures of tar and pitch, and I would be very glad to hear of a case where bitumen pure and simple has been used, and what was the origin of the bitumen in question.

I quite agree that genuine bitumen, without the admixture of tar, &c., is the finest known preservative, but unfortunately it has not been used as far as I know, without adulteration, and bitumen, therefore, merely named, has not had a full opportunity of showing what it is capable of.—Yours, &c.,

FOUNDER.

May 1, 1915.

Town Planning at Colne. The Local Government Board have given authority to the Corporation of Colne to prepare a town planning scheme in respect of an area of about 836 acres in the borough.

Parliament-square Wood Paving. In the House of Commons on Saturday last Mr. Booth asked the hon. Member for Saffron Walden, as representing the First Commissioner of Works, whether the contract for wood pavement in front of the Houses of Parliament was placed with a condition that the work should be completed during the Easter Recess; and whether competitive tenders were withdrawn because, in the opinion of the firms concerned, it was impossible to finish the work in the specified time? Mr. Beck stated, in reply, that tenders were invited from five firms, of whom four sent in an offer; the lowest was accepted. There was no condition that the work should be completed during the Easter Recess, and therefore the point raised in the latter part of the question did not arise.

THINGS ONE WOULD LIKE TO KNOW.

(Contributed.)

Is it not curious that the breaking strain of red tape is beyond the most learned mathematician's calculation? Is not the action of the Local Government Board with regard to the urban district councils of Malden and Coombe, and their refusal to allow them to pay the cost of a small rifle range an example of this strength?

* * * *

Is it not strange that, whereas on the one hand we hear of the excessive difficulty experienced in procuring land for the purpose of erecting workmen's dwellings owing to the price demanded by the owners we also hear the all sides complaints of owners of land as to the depreciation of the value of their property which has lately occurred? What has the great National Land Valuation scheme done to solve this anomaly?

* * * *

Is not the city surveyor of Manchester to be congratulated on the fact that out of 154 members of his staff, no fewer than fifty-two have joined the Army since the outbreak of the war? Is it not evident that if this splendid spirit animated the majority of the able-bodied men in this country the period of the war would be considerably shortened? Are there not even now far too many men in this country still doing work which could be equally well performed by women?

* * * *

Would it not be somewhat enlightening if we could have an expression of opinion on the somewhat vexed question as to whether tarred gaskin is really necessary in a [illegible] for sewerage? Do we not find that, whereas one set of sanitary engineers contend that it is essential, another set say that they would not have it at any price? What is the truth as to the expediency of using it?

* * * *

Has not the correspondence in THE SURVEYOR with regard to the last report of the Royal Commission on Sewage Disposal been of considerable value? Is it not evident that nearly everyone is agreed that "the last word" has not yet been said upon the problem of the best way to treat sewage for purposes of purification? Is it not to be hoped that the Local Government Board will embark on some research work in this direction, if they can spare the time from town planning?

* * * *

Is it a fact that, for the past forty years or more, every school that has been erected in Germany has been so designed that it can at any time be converted, at very small cost, into a military hospital? Will our school authorities in this country take a lesson in "Kultur" from the Huns, who seem to have had a wonderful conception of what they were preparing for many years before putting it into operation?

A District Council's Protest.—At the annual meeting of Stourport Urban District Council it was decided to write to the Worcestershire County Council protesting against the delay in paying the amount due for maintenance of the main roads. The clerk said the final payment for the year ended March, 1914, was not made till a year after it was due. It was also decided to protest against a reduction made on the amount claimed by the council.

Lower Thames Valley District Surveyors' Association. The Lower Thames Valley District Surveyors' Association held their last meeting of this session on April 24th, a visit being made to Surbiton, where a pleasant and instructive afternoon was spent in inspecting the sewage disposal works and destructor. Tea was provided by Mr. H. T. Mather, the surveyor to the urban district council. At the evening meeting, Mr. J. W. Croxford, the president, in the chair, a discussion on the works visited during the afternoon took place, the consensus of opinion being that the results attained by Mr. Mather were highly satisfactory. The annual dinner of the association, owing to the war, is not being held this year. During the summer the association hope to make visits of inspection to works in progress and completed.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of SURVEYOR *readers with a view to making the information given under this head as complete and accurate as possible.*

INQUIRIES HELD.

Little Hulton U.D.C. (April 29th. Mr. Raymond Unwin.)—This was an inquiry into an application for authority to prepare a town planning scheme for the district. The clerk, Mr. J. H. Heys, stated that the council had several times had under consideration the advisability of preparing a scheme in accordance with the Town Planning Procedure Regulations Act, and in August, 1913, notice was given of their intention to apply for powers. Most of the land in Little Hulton was built on in strips, the districts most affected being Manchester-road West, Cheggs-lane, and Worsley-road, and future building would have to take place off the high roads. They had had an informal conference, when the owners of property or land were given an opportunity to object to the scheme, but no opposition was offered. That being so, it was felt that the council could not do better than proceed on town planning lines. They were not very well served with roads on the east and west, but they could not complain about those on the north and south sides. Their building by-laws had been in force from 1887, but were reviewed in 1906 or 1901, and brought up to date. It was stated that details would be considered later.

Newport (Mon.) T.C. (May 4th. Mr. P. M. Crosthwaite).—£14,820 for drainage works in the Corporation-road district, and £765 for the purpose of raising the eastern bank of the river Usk from 30 ft. to 32 ft. fronting certain works.—The deputy town clerk (Mr. Treharne Morgan) stated that the new drain had become necessary because the Mannesmann Tube Company had taken a large area of land upon which to build large works, where something like 3,000 men would be employed. The offices had been built, and, though the works were not now being built, the corporation had been informed by the engineer to the company that some portion of the works would be completed this year. One of the conditions of the works coming to Newport was the construction of this drain, and the corporation had entered into an agreement to supply it. The corporation wanted to be in a position to proceed with the work at once. The inspector remarked that it was difficult to get sanction for loans just now. The deputy town clerk replied that the corporation wished to be able to go on with the work as soon as convenient.

APPLICATIONS FOR LOANS.

Belfast R.D.C. - £250 for works of sewerage.

Cornwall C.C. £728 for the enlargement of the laundry at Truro asylum.

Fyvie School Board. £1,000 for the rebuilding of Woodhead school.

Oswestry R.D.C.—£350 for water supply extensions.

Rathdrum R.D.C.—£1,400 for the Kilpedder sewerage scheme.

Rothwell U.D.C. £7,300 for the Lemonroyd sewage disposal scheme.

Southampton T.C.—£14,000 for building a water tower.

LOANS SANCTIONED.

Haslingden T.C. £4,600 for electricity mains, and £2,770 for transformers, switch gear, and services.

Leeds T.C. £158,356 for the electricity undertaking, and £40,000 for the gas undertaking.

Liverpool T.C. £24,500 for a small pox hospital.

Middlesbrough T.C.—£4,600 for the improvement of Auckland-road.

Newry Port Sanitary Authority.—£500 for an isolation hospital.

Swansea T.C.—£3,100 for the purchase of land for hospital extension.

Walton-on-the-Naze U.D.C.—£500 for sea defence works.

FORTHCOMING INQUIRIES.

MAY.	£
10.—**Chadderton.** For works of sewerage (Mr. R. H. Bicknell)	1,495
10.—**Langport.** For works of water supply (Mr. W. O. E. Meade-King)	
10.—**Normanton.** For the erection of workmen's houses (Mr. Courtenay Clifton)	1,400
11.—**Brampton.** For works of water supply (Mr. A. G. Drury)	3,600
11.—**Folkestone.** For works of sewerage (Mr. P. M. Crosthwaite)	1,000
11.—**Lymm.** For works of sewage disposal (Mr. R. H. Bicknell)	300
11. **Milnrow.** For works of sewerage (Mr. F. H. Tulloch)	1,000
12. **Ambleside.** For works of sewage disposal (Mr. A. G. Drury)	922
12.—**Hythe.** For works of sea defence (Mr. P. M. Crosthwaite)	1,590
13.—**Gannock.** For the erection of working-class houses (Mr. Courtenay Clifton)	10,675
13.—**Manchester.** For works of sewerage (Mr. A. G. Drury)	9,060
14.—**Tamworth.** For works of sewage disposal (Mr. A. G. Drury)	2,200

THE LOW COST ROAD.*

By Philip P. Sharples.
New York.

It is a great mistake, economically, to choose a type of road that is better than we need for the purpose. It is a little hard to illustrate this point without going to extremes. In New England temporary roads are built for hauling logs out of the woods in winter time, and perhaps the road will only be used one winter. Naturally not much money can be spent on it. On the other end of the scale let us take the main street of a very large city—say the approach to the Brooklyn Bridge in New York City. That thoroughfare receives, perhaps, more travel than any other in the United States, and it would be economy to build the very best type of pavement regardless of cost. These are the two ends of the problem, and any local engineer must choose a road somewhere between those two types.

In this country [the United States] you must choose the low types very often, but it pays to put in the best of the type and to provide for excellent maintenance. It is a great mistake to neglect the low-cost road; it often leads to extravagance in the community. I have seen districts where high-cost roads have been built just because the low-cost roads were not properly maintained. The low-cost roads, kept in condition, would have answered the needs of the community, and as a greater mileage could be built and maintained than with the high-cost section built, the whole community would have been better off.

It is not to be expected that such a community will take care of the high-cost road. In a few years the wreck of the high-cost section will probably, for the sake of a little maintenance, be on a par with the other poor roads.

* Extract from paper read at Road Convention held at Manitoba Agricultural College on March 5th last.

LOCAL LOANS.

A WEST HAM APPLICATION.

In the House of Commons on Wednesday Mr. W. Thorne asked the President of the Local Government Board whether he was aware that the West Ham Corporation made an application to the Local Government Board for a loan of £20,000 for the purpose of extending their asylum at Goodmayes, and that the overcrowding at the asylum was seriously affecting the health of the patients, and if he could give any reasons why permission to obtain the loan has been refused.

Mr. Herbert Samuel stated that the town council of West Ham had applied to the Local Government Board for sanction to a loan of £4,532 for extensions at the asylum at Goodmayes. Sanction had not been refused by the board; but in view of the restrictions upon borrowing by local authorities at the present time the town council had been advised to communicate with the Home Office with a view to ascertain whether they would be able to obtain Treasury approval of the loan if the board were willing to sanction it.

Engineers and the War.—The whole staff in the engineering department of Glasgow University, including lecturers, assistants, demonstrators, and workmen in the laboratory have offered themselves in a body to the military authorities in case their services might be of use in connection with the provision of munitions of war.

Assistants' and Students' Section.

CONDUCTED BY SYDNEY G. TURNER, ASSOC.M.INST.C.E.

All communications in regard to this page must be addressed to The Editor, St. Bride's House, 24 Bride-lane, Fleet-street, E.C. *Envelopes must be marked "Assistants' Section" in the top left-hand corner. Correspondents are invited to submit questions for consideration and answers to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.*

THE MONTHLY PREMIUM.

The premium for April is awarded to

Mr. E. W. Picot,
Fernside,
Handel-road,
The Polygon,
Southampton.

whose contributions have, in the opinion of the adjudicators, been the best received during the month.

QUESTIONS.

This week answers are invited to the following questions:

474. Roof Truss.—When one end of a steel roof truss is supported on rubber bearings what provision is made to counteract the movement and to prevent damage to the slates and timbers? How would any movement in the truss affect the roof covering? How much, in a 40-ft. span roof, likely to move? ("T-Square.")

477. Levelling.—In a series of levels, if the first back sight read 3·25 on an ordnance bench mark of 28·30, the sum of the back sights be 12·95, and fore sights 17·20, what will be the ordnance reading of the last fore sight? (E. W. P., *Southampton.*)

478. Levelling.—It is required to find the difference of level of two pegs on opposite banks of a river, and it is known that the collimation line of the level will have to rise 1 in 2 out of adjustment. How would you find the difference of level required? (E. W. P., *Southampton.*)

479. Reservoir Dam.—Give sketch and description of an earth embankment, with clay puddle across a mountain brook 12 ft. wide, rising from each side of brook 1 in 2, the embankment to be 12 ft. high above the river bed. (R. P. M., *Newport.*)

[The Editor is at all times glad to hear from readers who desire to submit questions regarding matters of general interest, points of daily practice, &c., for insertion in the "Assistants' and Students' Section." Questions which are published are taken into consideration, as well as other matter, in awarding the Monthly Premium.]

REPLIES TO QUESTIONS.

475. Hydraulics.—A pipe 5 in. in diameter delivers a certain quantity of water per minute with a loss of head of 4 ft. Determine the loss of head if the same quantity were delivered through a pipe 4 in. in diameter, assuming the same coefficient of friction.

By D'Arcy's formula we have

$$h = \frac{2 f L V^2}{g d}$$

where h = head in feet lost in friction
f = coefficient of friction
L = length of pipe in feet
V = velocity of water in feet per second
g = acceleration due to gravity
d = diameter of pipe in inches

$$\therefore V^2 = \frac{g d h}{2 f L}$$

$$\therefore a V^2 = \frac{a^2 g d h}{2 f L}, \text{ where } a = \text{cross-sectional area of pipe in square feet}$$

$$\therefore Q^2 = \frac{a^2 g d h}{2 f L}, \text{ where } Q = \text{discharge of pipe in cubic feet per second}$$

Then if d_1 = original diameter of pipe
d_2 = new " "
a_1 = original cross-sectional area of pipe
a_2 = new " " "
h_1 = original head lost in friction
h_2 = new amount of head lost in friction

We have $\frac{a_1^2 g d_1 h_1}{2 f L} = Q_2 = \frac{a_2^2 g d_2 h_2}{2 f L}$,

Q, f, L, and g being common to both expressions.

Substituting we get

$$4\left(\left(\pi\left(\frac{5}{12}\right)^2\right)^2\left(\frac{5}{12}\right)\right) = \left(\left(\pi\left(\frac{4}{12}\right)^2\right)^2\left(\frac{4}{12}\right)\right)$$

$$\therefore \frac{4 \times 5^5}{12^5} = \frac{4^5}{12^5} h_2 \quad \therefore h_2 = \frac{3125}{256} = 12{\cdot}2 \text{ feet}$$

Hawksley's formula for head lost in friction gives a similar result.

$$\text{Loss of head} = \sqrt{\frac{(3{\cdot}7 d)^5}{L}}$$

where Q = number of cubic feet per minute
d = diameter of pipe in inches
head = in feet
L = length of pipe in yards

Thus we have, using our previous notation,

$$Q = \sqrt{\frac{(3{\cdot}7 d_1)^5 h_1}{L}} = \sqrt{\frac{(3{\cdot}7 d_2)^5 h_2}{L}}$$

$$4^5 \times 5^5 = 4^5 \times h_2 \quad (\because h_1 = 4)$$

$$\therefore h_2 = \frac{3125}{256} = 12{\cdot}2 \text{ feet}$$

(B. K., *Newport, Mon.*)

476. Vectors.—State the essential properties of vector quantities, and distinguish between "vectors" and "scalars," giving two examples of each.

Forces are vector quantities—that is, they can be represented in magnitude, direction and position by straight lines, and so the magnitude and direction, but not necessarily the position, of a number of forces is given by the law of vector addition—viz., the resultant or sum of the number of vector quantities. A scalar quantity is one not involving direction. Let lines 1, 2, 3, 4 (Fig 3) represent the lines of action of a system of forces applied to the parts of any structure, and the arrow-heads indicate the sense in which these forces are supposed to act.

If a figure be constructed having each of its lines parallel to one or other of these forces, and of a length proportional to the intensity of the force, this will constitute the polygon of forces.

Fig. 4.—Draw line AB parallel to force line 1, and representing by its length and direction the intensity and sense of the chosen force. From B, the extremity of line AB, draw BC parallel to the direction, and of a length proportionate to the intensity of the force applied along the path indicated by the arrow-headed line 2; continuing the same process, draw line CD parallel to and representative of force 3, and lastly draw line DE parallel to and representative of force 4. This unclosed polygon ABCDE (Fig. 4) is termed the polygon of the given forces, because each of its sides is a graphic representation of two special properties belonging to one of the applied forces—viz., its direction and intensity. There is a third property possessed by each applied force which is not given by this polygon; this third quality, which is termed the actual path of application of the force, is defined by the arrow-headed lines. If, in order to complete the polygon ABCDE (Fig. 4), a line AE be drawn joining the free ends, it can be proved that this line will be a graphic delineation of the resultant sense and magnitude of the applied four forces. It is clear the resultant of the first two forces AB and BC could be represented according to the principle of the triangle of forces by the line AC connecting the angular points A and C; again, replacing the first two forces by their graphic resultant AC, it follows by the same principle that the resultant of forces AC and CD will be defined in direction and intensity by the AD, and the resultant of the forces AD and DE will be represented by the line AE. But the line AD is the graphic sum or resultant of the forces AB, BC and CD; therefore the line AE will be the graphic sum or resultant of the forces AB, BC, CD and DE; or the line AE, measured in the sense of from A to E, is a graphic delineation of

the resultant magnitude and direction of the applied four forces.

Polar or Funicular Polygon of the Given System of Four Lines.—Take any point O (Fig 5) in the plane of forces, and draw from this point the lines OA, OB, OC, OD and OE. On Fig. 6 draw any line O^1O^1 across the force line 1, and parallel to the polar line OA of Fig. 5. Let O^1O^1 intersect the force line 1 in a point 1^1; from 1^1 draw line $1^1 2^1$ parallel to the polar line OB, intersecting the force line 2 in a point 2^1. From 2^1 draw line $2^1 3^1$ parallel to the polar line OC, intersecting the force line 3 in a point 3^1. From 3^1 draw line $3^1 4^1$ parallel to OD, intersecting the force line 4 in a point 4^1, and from 4^1 draw line $4^1 5^1$ parallel to OE, intersecting line O^1O^1 in a point 5^1.

The polygon $1^1 2^1 3^1 4^1 5^1 1^1$ (Fig. 6) is the polar or funicular polygon of the given system of force lines.

Since the position for the pole O (Fig. 5) can be pitched anywhere in the plane, it follows that for the same system of force lines there can be constructed relatively to different poles an indefinite number of polar polygons. Further, the line O^1O^1 (Fig. 6) was drawn parallel to line OA, which joins the pole O to the origin A of the polygon of forces (Fig. 5); but the position of the line O^1O^1 was not more definitely restricted—that is to say, this line can be moved parallel to itself into any other position in the plane. Consequently, since the direction of the lines composing the polar polygon are determined for any particular pole O, by the directions of lines issuing from that pole and passing to the angular points of the polygon of forces, it follows that by choosing the first line O^1O^1 in various positions in the plane there can be constructed a series of similar polar polygons all related to the same pole, and having their sides respectively parallel to each other. All polar polygons, whether drawn for the same or different poles, possess in common the singular property of indicating a point on the line of action of the resultant of the given system of forces. If a system of forces be applied to any structure in the objective paths 1, 2, 3, 4, (Fig 6), their resultant will pass through a point 5^1 determined by the intersection of the first and last lines O^1O^1 and $4^1 5^1$ of the polar polygon. Since the polygon of forces (Fig. 5) gives the direction and magnitude of the resultant as represented by line AE, it may be inferred that the three properties of the resultant force, expressing its sense, magnitude and line of action, are furnished by means of the two figures, denominated the polar polygon and the polygon of forces.

Hence a line drawn through the point 5^1 (Fig. 6) parallel and equal to the line AE (Fig 5), will represent not only the sense and magnitude of the resultant force, but also the actual path of its application. (E. W. P., *Southampton.*)

Fig. 1

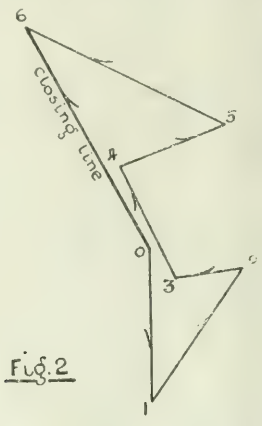

Fig. 2

Vector polygon

Vector quantities are those which require both a magnitude and direction to completely define them. Quantities such as force, velocity and acceleration are vectors. The numerical value of a vector is called the "tensor"—*i.e.*, the tensor of a vector. The direction is called the "ort." Any quantity which has magnitude and direction is a vector. In vector algebra clockwise direction is considered negative, and counter-clockwise direction is considered positive. An underlined symbol denotes a vector quantity, thus: $\underline{a}$ is a vector quantity, $\underline{a}_x$ is a vector quantity with magnitude a and direction α. Scalar quantities only require an arithmetical number to completely express them, or to express the number of times they contain a certain unit—*e.g.*, the area of a triangle, temperature work, &c. The length 3 miles is a scalar quantity; 3 miles N.E. is a vector quantity. If we are told a boat has a speed of 15 miles per hour from a certain point, we are given a scalar quantity, and we shall be ignorant of the boat's position when it leaves the starting-point; but if we are told that the speed is 15 miles per hour due north, we know the direction, and can find the boat's position relative to the starting-point after a certain time has elapsed. Vectors may be added together algebraically or graphically. (J. W., *Leeds.*)

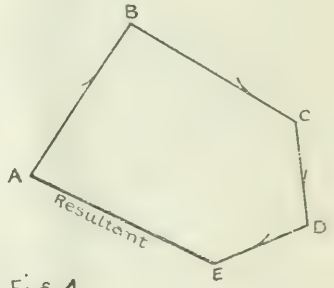

Fig. 4

Polygon of forces

Henry Saxon Snell Prize.—The Royal Sanitary Institute announce that the prize of fifty guineas and the silver medal of the institute is offered this year for an essay on "Suggestions for Improvements in the Sanitary Arrangements and Appliances suitable on Board Ship for (*a*) Passengers and crew, (*b*) Cattle and other live stock." Further particulars can be obtained from the offices of the institute.

ATHERSTONE COUNCIL'S STONE CONTRACT.

OBJECTION TO QUARRY OWNERS' AGREEMENT.

At a meeting of the Atherstone (Warwick) Rural District Council (reports the *Birmingham Post*), the chairman, Mr. W. G. Phillips, called attention to the fact that the contract for stone had been given to one firm, and said the committee had departed from the usual practice of dividing it among three local quarries. Was there any difference in the price of the tenders?

The vice-chairman, Mr. T. Slack, said there was no difference in price. The Highway Committee took the matter into consideration fully, and came to the conclusion that it was in the interests of the council that one firm should have the contract. It was no use advertising for tenders if all the quarry owners agreed to send in the same quotations.

The chairman: You seem to have an idea that there is a combination among the quarry owners. I have told you before that is not so, but your wisdom seems to carry you so much further than mine. The firms have agreed simply upon a price that they consider remunerative, and when I tell you that I speak with authority. It has been a rule that the council's orders for stone should be divided equally. Of course, if one firm sent in a lower price the other quarry owners would not be able to grumble. Seeing that all the prices are the same, and that all the quarry owners are large ratepayers in the district, the old practice should have been observed. However, you will find that you will not gain anything by the new method.

The vice-chairman said it was not the first time the Highway Committee had given the contract to one firm, but on the previous occasion the firm would not accept it unless the contract were divided between several quarry owners.

AGREEMENT AS TO PRICE.

Rev. H. Wilson Lee: I hate these combines, which destroy healthy competition.

The chairman repeated that there was no combination among the quarry owners. Personally, he did not care twopence about the matter. It would neither set up the quarry in which he was interested nor would it break it down.

Mr. S. Adams remarked that there must be an agreement between these firms.

The chairman: They have agreed upon a price, but you will not break it down by the course you have adopted.

The vice-chairman: Where is the need for advertising when you get the same prices?

The Rev. Wilson Lee said it was the council's business to do the best they could for the district.

The chairman: You must measure what you do for the district in terms of £ s. d. I protest against what has been done, and undertake to say that the surveyor will not get on as well with one firm as he did with three. I speak feelingly, as I am probably the largest ratepayer in the district. The council have departed from a fixed policy without saving a single sixpence.

The Rev. Wilson Lee: That is not a fair argument to raise, as I am as large a ratepayer in proportion as you are.

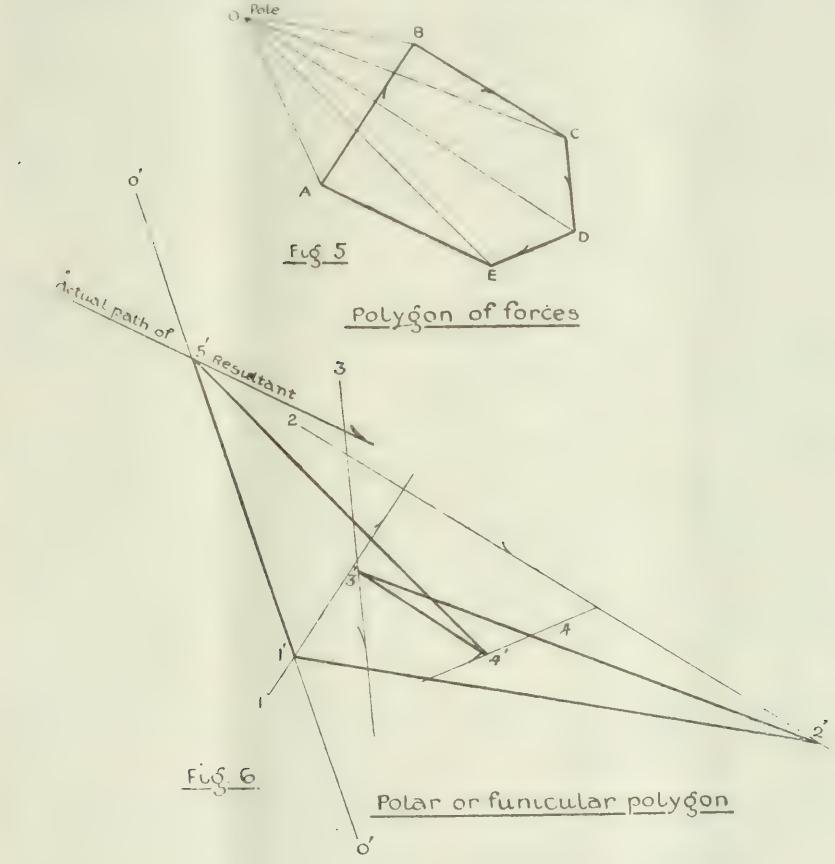
The chairman: I have told the surveyor this: "You must not consign any of that stone to my sidings, because I will not have it there." I tell you candidly that the sidings will not be used for that purpose.

Several members: Don't say that, Mr. Chairman!

The vice-chairman: I thought it did not concern you!

The chairman: It does as a matter of principle.

The subject then dropped.



Middlesex County Council and Quantity Surveyors.—The Middlesex County Council have agreed to fix the rate of remuneration to any quantity surveyors employed at 1½ per cent on contracts of £2,000 or under, 1¼ per cent between £2,000 and £5,000, and 1 per cent beyond £5,000.

Municipal Work in Progress and Projected.

The Editor invites the co-operation of Surveyor *readers with a view to making information given under this head as complete and accurate as possible.*

The following are among the more important projected works of which particulars appear below: Buildings—Burnley, Kingston-on-Thames, Rochdale; housing and town planning—Newcastle-on-Tyne, Weymouth; roads and materials—Greenwich, York; sewerage and sewage disposal—Manchester, York.—Particulars of other projected works will be found in our "Local Government Board Inquiries" page.

ADMINISTRATION.

Cork T.C.—With reference to certain statements made at a previous meeting of the Works Committee, the city engineer, Mr. J. F. Delaney, said it had been asserted that his staff had been doubled of recent years. When he took up office there were eight men on his staff, costing £13 12s. per week. At present his staff was costing £14 11s. 3d. per week, and there were seven men in his office; so that, instead of his staff having been doubled, he was short-handed. All the staff in the office had received increases by Order in Council. In 1905 his chief clerk died, and he reorganised his staff. Every assistant was given an increase, which effected an economy of £84 10s. per annum. The reorganisation reported last week to the committee, on which the question arose, meant a saving in that branch of the department of £39 per annum.

BUILDINGS.

Brighton T.C.—The Library Committee recommend the council to carry out repairs to the roof of the Booth Museum.

Burnley T.C.—The provision of a tuberculosis hospital at Crown Point is being considered by the Health Committee.

Clitheroe T.C.—A new technical school, designed by the county architect, Mr. H. Littler, has been built in York-road. Messrs. J. Bleazard & Sons were the contractors, and the cost was £20,000.

Grangemouth T.C.—Improvements are to be carried out at the reservoir, at an estimated cost of £300.

Guildford R.D.C.—A contribution of £975 has been made by the county council towards the cost of the reconstruction of Broadmead, Cartbridge, Hatch and Round Hole bridges. A letter having been received from the War Department Lands Office, Aldershot, forwarding a military requisition for the reconstruction of Curzon Bridge, across the Basingstoke Canal, at Pirbright, the surveyor, Mr. J. Anstee, was directed to prepare plans and estimate of the cost of reconstructing the bridge, and forward them to the War Department as requested. The surveyor was also directed to prepare an estimate of the cost of repairing Wisley Bridge.

Kent C.C.—A scheme has been passed for the rebuilding of the offices at the North Preston school, at an estimated cost of £700.

Kingston-on-Thames T.C.—It is proposed to build a new elementary school with accommodation for 1,000 children.

Lowestoft T.C.—The question of providing a dental clinic is under consideration.

Middlesbrough T.C.—The Sanatorium Committee are negotiating with the Darlington Corporation with respect to a proposed joint tuberculosis sanatorium.

Rochdale T.C.—The Health Committee have approved plans for a sanatorium for consumptives which it is proposed to erect at an estimated cost of about £14,000.

Swansea T.C.—A building comprising a new police station and courts in Alexandra road has been completed.

HOUSING AND TOWN PLANNING.

Atherstone R.D.C.—The surveyor, Mr. H. J. Coleby, on Tuesday last submitted plans and estimates of a scheme for the erection of sixty-nine working-class dwellings on land which has been acquired for the purpose on the Coleshill-road. It was decided to submit the whole scheme to the Local Government Board for their approval, and permission was given by the council, in the first instance, for the building of twelve houses.

Bradford U.D.C.—Acting upon the request of the council, Mr. Selfe and the surveyor, Mr. R. B. Lees, inspected and reported as to the working of the kitchen ranges in the council's working-class dwellings in Frome-road. Mr. Selfe said he did not think the ranges would ever be much good. Both the surveyor and himself advised the substitution of closed for open ranges. Mr. Solomon: I think the chairman once said these houses would give us some experience, and I think we have got it. Eventually it was decided that the surveyor should dispose of the existing ranges to the best advantage, and put in the type recommended.

Newcastle-on-Tyne T.C.—The council on Wednesday resumed its discussion of the proposal to erect 688 dwellings of various types on its estate at Walker, the cost being £117,000, and the estimates showing a small surplus. Arguments in favour were the house famine in Newcastle, and the desirability of developing the estate with good class dwellings, while the Labour members held that the scheme would facilitate the provision of homes for munition workers coming to the city. The opposition argued that the time for such an expenditure was inopportune, and it was also suggested that the Treasury would not permit the money to be expended. The scheme was adopted.

Weymouth T.C.—The Local Government Board have sanctioned a scheme for the erection of 150 workmen's houses, at an estimated cost of £40,000.

PARKS AND OPEN SPACES.

Bangor (Co. Down) U.D.C.—Negotiations are to be opened for the purchase of 9 acres of land on Seacliff-road for the purpose of a public park. The approximate price is £2,700 for the ground and two villas.

Worcester T.C.—The General Purposes Committee have been authorised to carry out paving operations in Fort Royal Park, if considered desirable.

ROADS AND MATERIALS.

Anglesey C.C.—With regard to three out of four of the county council's proposals for surface tarring of roads in the county, the Road Board have intimated that they are prepared to make a grant of £425, being half of an estimated expenditure under this head of £850.

Beccles T.C.—It was reported by the Sanitary Committee that their requirements to September 1st will include £350 for granite, £120 for broken flint, £20 for channelling, £130 for tar-painting, and £60 for steam rolling.

Berkhampstead U.D.C.—The council have instructed the surveyor, Mr. J. R. Hadfield, to carry out the annual tar-spraying. In answer to a councillor, the surveyor said he was of opinion that 5 ft. was the proper margin to leave untarred on inclined roads.

Bermondsey B.C.—It has been decided to adopt the suggestion made by the Commissioner of Police, and have the kerbs whitened with the object of avoiding street accidents.

Cambridge T.C.—The council have passed a resolution asking the county council to declare a further list of roads in the borough main roads. Should the application be complied with the total length of roads to be mained will be about 4¾ miles.

Chester T.C.—It is proposed to repave Newgate-street with reinforced concrete, at an estimated cost of £200.

Cirencester U.D.C.—The sanction of the Local Government Board is to be sought for a scheme of improvement at Bishop's Corner.

Croydon T.C.—A scheme has been approved for making up Shirley Park-road, at an estimated cost of £1,140.

Exeter T.C.—It has been agreed to spend £1,100 on tar-spraying. The city surveyor, Mr. T. Moulding, stated that tar was costing twice as much as formerly.

Greenwich B.C.—A number of schemes of road repair have been submitted by the Highways Committee for the approval of the borough council.

Lancashire C.C.—The Main Roads and Bridges Committee, in a report on a recent circular letter issued by the Local Government Board, points out that the refusal of the Local Government Board to sanction capital expenditure on a main road which is in such a state that reconstruction with granite

... concrete or with tar-macadam, as ... necessary, subject to a loan to the Road Board being ... Such a road must be maintained in a condition so that it will not become objectionable, and if this has to be done out of revenue for one, two or three years, a large expenditure will be necessary, with the knowledge that as soon as sanction is obtained the reconstruction out of capital must be carried out. This expenditure out of revenue cannot be defended on economic grounds, and, as there are several cases of main roads needing reconstruction at the present moment by the methods mentioned, the committee feel that they might find it necessary to make representations to the Board on the matter.

Lancaster T.C.—The council have agreed to sanction a scheme for widening Caton-road, at a cost of £2,015, towards which the Road Board and the county council will contribute £1,500.

Oystermouth U.D.C.—The surveyor, Mr. W. P. Pettit-Jones, is preparing plans for making up the streets under the Private Street Works Act.

Rugeley U.D.C.—Mr. W. E. Rogers, surveyor, had prepared a plan for the widening of Hagley-road, but, as the terms offered by the Road Board to cover part of the cost were not considered satisfactory, it has been decided to confine the operations to levelling, ... and ... It has also been agreed to ... parish hall and the ... Church.

Shoreham U.D.C.—Application is to be made to the Road Board for a further contribution of £100 on account in respect of the expenditure on roads.

Stoke Newington B.C.—With reference to the ... plant by a ... of the dust nuisance in the northern part of the borough, it was explained that the council had a difficulty in obtaining horses and men to do street watering.

Twickenham U.D.C.—It has been decided to make up under the Private Street Works Act, 1892, that portion of Cambridge-road, which has not yet been ... a public ...

Wandsworth B.C.—The council have agreed to inform the Commissioners of Police that they would be prepared to give effect to the proposal that the kerbs of dark corners and at refuges which were not adequately lighted should be whitened.

Worcester T.C.—It has been agreed to apply to the Local Government Board for a Provisional Order authorising the compulsory purchase of such properties as were required for the widening of High-street, one of the principal thoroughfares of the city. It has also been resolved to apply for compulsory powers in regard to the improvement of St. Martin's Gate.

Worthing T.C.—The council have agreed to the scheme for making up Grand-avenue under the Private Street Works Act, and that in the event of certain owners refusing to withdraw their objections the necessary steps be taken to have the matter decided by the Justices.

York T.C.—Application has been made to the Treasury for authority to carry out a scheme for laying tar-macadam in Bootham-road, at an estimated cost of £3,000, to be provided by the Road Board.

SEWERAGE AND SEWAGE DISPOSAL.

Beccles T.C.—It is proposed to carry out a sewerage scheme in Swines-lane, at an estimated cost of £200.

Burton T.C.—The Local Government Board have intimated their inability at present to sanction a loan of £30,000 which the corporation wish to raise for carrying out the duplication of the sewerage rising main. The corporation regard their scheme as absolutely imperative if a repetition of the bursting of the rising main and consequent liability for legal proceedings are to be avoided. Tenders for the supply of pipes in connection with the work have been accepted provisionally, and the first instalment of the anticipated loan was included in the estimates for the current year.

Cardiff T.C.—The Treasury have been asked to sanction a scheme of drainage through the cemetery, the estimated cost being £3,500.

Farnham R.D.C.—Consideration is being given to a proposed scheme of sewerage for Hindhead, Frensham.

Manchester T.C.—Extensions at the Davyhulme sewage works are to be carried out, at an estimated cost of £23,000.

Twickenham U.D.C.—The surveyor, Mr. F. W. Pearce, reported that, in dealing with the question of combined drainage, it had hitherto been the practice, in cases where the council had accepted the responsibility for relaying the main line of drain, to allow such main line of drain to be still used as a combined drain with one intercepting trap and ventilating shaft for the whole of the various premises communicating therewith. It would, however, he thought, be desirable in future that that practice should be discontinued, and that, in cases where the contention was set up by the owners that the main line of drain was a public sewer vested in the council, the by-law distinction between a sewer and a drain should be strictly enforced, and the owners required to provide a separate line of drains, with the necessary intercepting chamber and ventilating pipes or shafts, for each ... The ... suggested was adopted by the council.

Wolverhampton T.C.—Progress is being made with the scheme for the abolition of the pan system. The chief sanitary inspector, Mr. John Peers, reports that up to date upwards of 3,000 water-closets have been completed.

York T.C.—As a matter of urgency, the sanction of the Treasury is being asked to the construction of a new sewer at Yearsley Bridge, at an estimated cost of £[illegible].

WATER, GAS, AND ELECTRICITY.

Coventry T.C.—The electricity undertaking carried a net profit of £[illegible] in the last financial year.

Dungannon U.D.C.—A notification has been received from the Local Government Board that they will grant a Provisional Order for the improvement of the local water supply in the terms of the petition lodged by this council and the rural district council.

Omagh U.D.C.—The gas trading profits last year were £1,[illegible].

Poplar B.C.—The Electricity Committee, in their report of the undertaking during the past year, state that the working costs had decreased. The permanent ... from £[illegible] in 1908 to £[illegible] in 1911 and the nett profit had gone up from £2,700 in 1908 to over £8,000 last year. Wages and salaries had gone up very largely—from £9,155 to £17,500. Notwithstanding these increases, they had increased the profits. The average selling price per unit had gone down from 1·6d. to ·97d. (less than 1d.), which is a great ...

MISCELLANEOUS.

Chiswick U.D.C.—The chairmen of the various committees were some time ago empowered to deal with ordinary matters arising out of work under the committee's control, simply reporting if the work was proceeding satisfactorily, and bringing up reports, if necessary, on directions given, and recommending action in matters affecting principles. The work, it is stated, has proceeded so smoothly and well that the system is to be continued for the duration of the war.

PROPOSED TUBERCULOSIS HOSPITAL FOR SOUTHEND-ON-SEA.

In the competition for the design of a proposed tuberculosis hospital for Southend-on-Sea the premiums offered have been awarded as follows:—

First Award: Mr. Percy Brockbank, 13, 14 and 15 County Chambers, Southend-on-Sea.

Second Award: Mr. H. Lord, 42 Deansgate, Manchester.

Third Award: Mr. J. Jameson Green, Adelphi Bank Chambers, 19 South John-street, Liverpool.

The assessors, Messrs. Frank Whitmore, consulting architect to the Essex County Council, Ernest J. Elford, M.INST.C.E., the borough engineer and surveyor, and C. Grant Pugh, the medical officer of health, describe Mr. Brockbank's scheme as very carefully prepared and thought out. The buildings are grouped at the extreme northern portion of the site. The administration block lies between the two ward pavilions, all facing south. The living hall and kitchen block lies behind, and is connected with the administration block and pavilions by two covered ways. The laundry and disinfecting block is in the rear. The future extension shows, south of the pavilion to be erected forthwith, a pavilion with further accommodation for adults and special provision for children.

PERSONAL.

Mr. Tough, electrical engineer to the Coventry Corporation, has had his salary increased from £650 to £700 a year.

Mr. A. O. Harpur, surveyor to the Caerphilly Urban District Council, has resigned after twenty-one years' service, owing to ill-health.

Mr. S. R. Lowcock, M.INST.C.E., and Mr. Arthur J. Martin, M.INST.C.E., have been elected members of the council of the Royal Sanitary Institute.

Mr. W. A. Jackson, surveyor to the Malton Urban District Council, has been voted £21 for extra services in connection with the construction of sewers and water mains.

Sergeant H. Y. Maulkinson, 5th Lincolnshire Regiment, late surveyor to the Mablethorpe Urban District Council, has been gazetted 2nd Lieutenant, 7th Batt Lincolnshire Regiment.

Mr. H. O. Hooper, draughtsman in the Torquay Borough surveyor's office, has been invited to take over the duties of building inspector in addition to his present work, at an extra remuneration of 15s. per week.

Mr. W. Willis Gale, ASSOC.M.INST.C.E., surveyor to the Carshalton Urban District Council, underwent a somewhat severe operation last week, and is now at a London nursing home. We are glad to be able to state that he is making most satisfactory progress.

Mr. George Roper Norrish, for many years manager to the St. Saviour's District Board of Works, London, died recently, we regret to state. The district board was incorporated in the area administered by the Southwark Borough Council, and Mr. Norrish retired with a pension.

Mr. W. Harpur, city engineer of Cardiff, was congratulated on Tuesday last by Alderman W. Roberts, at the meeting of the Public Works Committee, on his return after a short leave of absence owing to indisposition. Mr. Harpur thanked the members, and said his health was much improved.

Mr. T. B. Farrington, civil engineer, who died at Llandudno last week at the age of sixty-one, was well known in Manchester and North Wales. Articled to Messrs. Maxwell & Tuke, of Manchester, he had much to do on behalf of that firm in planning the winter gardens at Southport and in laying out St. Annes-on-Sea.

Mr. C. Gillard, assistant borough surveyor of Torquay, who has discharged the duties of the borough surveyor, Mr. H. A. Garrett, during the absence of that gentleman on active service since the outbreak of the war, has been granted an additional £5 5s. per month in consideration of extra duties, and also because of the satisfactory manner in which he has carried out the work of the department.

Dr. Samuel Rideal, F.I.C. (London), Messrs. Martin Deacon, M.INST.C.E. (Liverpool), John Parker, ASSOC.M. INST.C.E., city surveyor and waterworks engineer, Hereford, and J. Parry, M.INST.C.E., are among those who will take part in the discussion on the value of mechanical filters in the purification of water which is to be opened by Dr. Thomas Orr at a meeting of the Royal Sanitary Institute at Shrewsbury on Friday, the 28th inst.

One of the speakers at the recent Newark meeting in connection with the North-Eastern and Eastern District of the Institution of Municipal Engineers, in the course of his remarks instanced the case of the present borough surveyor of Newark (Mr. T. Peirson Frank), "who was leaving a post at £250 to take one which would rise to £750." This is, of course, somewhat misleading, as Mr. Frank is leaving a post at £450 to take one the remuneration of which will rise to £700.

Mr. A. D. Greatorex, M.INST.C.E., borough engineer and surveyor, West Bromwich, past-president of the Institution of Municipal and County Engineers, has been granted leave of absence by the town council, and gazetted as a lieutenant in the Territorial Force Reserve, and appointed to No. 1 Supernumerary Company, 2/6th South Staffs Regiment. Mr. Greatorex was formerly a lieutenant in the Hampshire Artillery Volunteers, and has been a member of the Staffs National Reserves since their foundation about three years ago. The company to which Mr. Greatorex has been appointed consists of National Reservists, and will be used for guard purposes.

Mr. J. Cracroft Haller's appointment to the county surveyorship of Notts, notified last week, was made on the recommendation of the Highways, Bridges and County Buildings Committee of the county council. Colonel Sir Lancelot Rolleston, in moving the adoption of the report, observed that the council were fortunate in securing the services of one who was already acquainted with the roads and methods of the county. The committee believed that Mr. Haller would serve the county most efficiently. Mr. Haller has held the position of chief engineering assistant to the late county surveyor, Mr. E. Purnell Hooley, M.INST.C.E., since June 1, 1914, and for the past three months has been acting county surveyor. Prior to entering the service of the Notts County Council, he was for ten years engineer and surveyor to the Carlton (Notts) Urban District Council, where he carried out many schemes of importance, and previous to this was at Guiseley for three and a-half years. Mr. Haller was articled to his father, Mr. J. C. Haller, ASSOC.M. INST.C.E., of Dewsbury.

The Road Board's New Regulations.—Mr. W. G. Bryning, the North Riding county surveyor, in an interview with a *Yorkshire Post* representative, in reference to the Road Board's new regulations, said he thought it would be a great pity if the Road Board withdrew, or reduced, their grants at the present juncture, especially in the North Riding, in view of the vastly increased traffic generally throughout the Riding caused by the military operations. The regulations had been under the consideration of the Highways and Bridges Committee, and will be discussed at the county council at their quarterly meeting on Wednesday week.

FOR OTHER ADVERTISEMENTS
See End of Paper.

HANWELL URBAN DISTRICT COUNCIL.
DESTRUCTOR AND SEWAGE WORKS MANAGER.

The Council are prepared to receive applications for the above appointment, the salary attached to which will be £2 per week, together with house and garden rent free.

Applicants must be thoroughly conversant with the working of a Destructor, the running of Steam and other Machinery, treatment of sewage by Chemical Precipitation and Filtration through Contact Beds and Revolving Sprinklers, and the cropping of a small Farm.

A Form of Application and List of Duties will be forwarded upon application.

Applications, in candidate's own handwriting, in envelopes supplied, enclosing copies of not more than three testimonials of recent date, to be delivered not later than Thursday, 20th May.

SIDNEY W. BARNES, ASSOC.M.INST.C.E.,
Surveyor to the Council.

Council Offices,
Hanwell, W.
May 5, 1915. (2,564)

URBAN DISTRICT OF FINCHLEY.
PRIVATE STREET WORKS.

The Council of the above-named District invites Tenders for the making up of Holly-park (Second Portion), together with all works incidental thereto.

Plans and Conditions of Contract may be seen, and Forms of Tender, Specification and Schedules of Quantities obtained, on application to the Council's Engineer, Mr. C. J. Jenkin, M.INST.C.E., at the undermentioned address.

A deposit of £2 will be required, which will be returned on receipt of a *bonâ-fide* Tender on the prescribed Form for the whole of the works, together with fully priced-in Schedules and the return of all papers issued.

Sealed Tenders, endorsed "Holly-park, Second Portion," to be addressed to the undersigned, and delivered not later than 4 p.m. on the 31st instant.

The Council does not bind itself to accept the lowest or any Tenders.

E. H. LISTER,
Clerk of the Council.

Council Offices,
Church End,
Finchley, N.
May 5, 1915. (2,565)

CITY OF LONDON NATIONAL GUARD VOLUNTEER CORPS ENGINEERS' UNIT.

The first parade of the Engineers' Unit, [illegible] special branch of the City of London National Guard and constituted by order [illegible] as a unit of the Corps of Volunteer Engineers [illegible] in process of organisation by the Central Association of Volunteer Training Corps, took place on Wednesday, April 21st, at the headquarters of the London Brigade R.G.A., Elthorne road, Highbury, N.

The staff and committee of the Engineers' Unit were represented by Colonel C. E. Cassal, V.D., Officer Commanding; Mr. W. Noble Twelvetrees, Acting Adjutant; Mr. R. St. George Moore, Platoon Commander; the Rt. Hon. Lord Headley, chairman of committee; [illegible] being Colonel C. L. E. Coleridge, V.D., Regimental Commandant of the City of London National Guard, and Captain G. [illegible] Officer Commanding the Headquarters Depot of the London Brigade R.G.A.

There was a good number of members of the unit, who were addressed by Colonel Cassal, and afterwards went through various evolutions under the command of Platoon-Commander St. George Moore. It is gratifying to note that a sufficient number of engineers have already been enrolled to form one complete platoon, and it is hoped that engineers and others will come forward without delay so as to ensure the organisation of the [illegible] company at an early date.

The Engineers' Unit are to be congratulated on the fact that they have received permission to drill at the headquarters of the London Brigade Royal Garrison Artillery, which include a fine drill hall and a parade ground covering an area of about an acre, thus affording ample space for effective military training. For this privilege the unit are indebted to the courtesy of the Officer Commanding the London Brigade R.G.A., and of the County of London Territorial Association.

We are informed that drills will be held on Tuesday, Wednesday and Thursday evenings each week, at 8.30 p.m. The headquarters are within five minutes' walk from Highbury Station (N.L.R. and City and Finsbury Park Tube), and from Caledonian-road Station (Piccadilly Tube), and are readily accessible from all parts of London. Full particulars relative to the unit, together with application forms for membership, can be obtained from the Acting-Adjutant of the unit, Mr. W. Noble Twelvetrees, M.I.MECH.E., 195 Bedford-hill, London, S.W., or from Headquarters, City of London National Guard.

The Committee of the Engineers' Unit has been constituted as follows, with power to add to their number:—

The Rt. Hon. Lord Headley, M.INST.C.E.I., F.S.E., M.R.SAN.I. (chairman).

H. Percy Boulnois, M.INST.C.E., late deputy chief engineering inspector Local Government Board, representing the Royal Sanitary Institute.

Colonel Cassal, V.D., F.I.C., F.C.S., F.R.SAN.I. (Officer Commanding).

R. St. George Moore, M.INST.C.E.

Captain W. H. Prescott, R.E., M.INST.C.E., M.I.MECH.E., barrister-at-law, representing the Institution of Municipal and County Engineers.

Norman Scorgie, M.INST.C.E., member of council, Institution of Municipal and County Engineers, representing the Society of Engineers (Incorporated).

W. Noble Twelvetrees, M.I.MECH.E., M.SOC.C.E. (FRANCE), A.M.I.E.E. (hon. secretary).

Dendy Watney, F.S.I., representing the Surveyors' Institution.

A correspondent writes: "On p. 574 of THE SURVEYOR of last week I notice a statement to the effect that Captain W. H. Prescott was appointed as the representative of the Institution of Municipal and County Engineers on the committee of the City of London National Guard Volunteer Corps. This is not correct, as Captain Prescott was actually appointed on the committee of the Engineers' Unit, which is quite independent of the infantry battalions of the National Guard." We gladly insert this correction, but would mention that the statement referred to formed part of the official report of the last meeting of the council of the Institution of Municipal and County Engineers.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

President: Mr. J. S. PICKERING, M.INST.C.E., Borough Surveyor and Water Engineer, Cheltenham.

SCARBOROUGH MEETING.

An institution meeting will be held in the North-Eastern District at Scarborough to-morrow (Saturday).

PROGRAMME.

10 a.m.—Assemble at the town hall.

10.15 a.m.—Reception by his Worship the Mayor (Mr. C. C. Graham). A paper entitled "Catering for the Wants of the Holiday-maker," by Mr. Harry W. Smith, ASSOC.M.INST.C.E., borough engineer and surveyor, will be taken as read. Any discussion thereon may take place at the close of the meeting after the various works have been inspected.

10.45 a.m.—Inspection of Spa improvements, beach bungalows, South Cliff Gardens, bathing pool, &c., in the South Bay.

1 p.m.—Lunch at the Grand Hotel. (Tickets, 3s. each.)

2 p.m.—Meeting of the members of the North-Eastern District to consider—

(*a*) The report of the Executive Committee as to the desirability of reporting the proceedings of district meetings in the Press.

(*b*) Any other business.

2.30 p.m.—Leave the Grand Hotel by char-à-banc (tickets 2s. each) for the Castle Hill, to view the damage caused by the bombardment on December 16, 1914, by the German battleships, and to inspect the Keep.

3.15 p.m.—Leave the Castle Hill, and inspect the Alexandra Gardens, Floral Hall, Peasholm Park, and the beach bungalows and bathing establishment in the North Bay.

4.30 p.m.—Leave the north end of the Royal Albert-drive by motor char-à-banc for drive along the Marine-drive, Valley Park, to the Mere.

5.15 p.m.—Afternoon tea at the town hall by the kind invitation of his Worship the Mayor (Mr. C. C. Graham).

AYR MEETING.

At the Scottish District annual meeting to be held at Ayr on June 4th and 5th, papers on town planning, municipal housing, road work, and scraping of water mains will be submitted.

On the first day visits will be paid to the municipal works of the town, and the following day will be devoted to inspections of experimental road stretches in Ayr County and Hillhouse Quarry, and to a visit to Loch Doon.

MATLOCK MEETING.

The arrangements for the institution meeting to be held at Matlock on June 12th include visits to the new sewage works, the brine and electric baths, and other undertakings.

J. W. DUDLEY ROBINSON,
Secretary.

92 Victoria-street, S.W.

INSTITUTION OF MUNICIPAL ENGINEERS.

President: Mr. W. H. MATTHEWS JONES, City Engineer and Surveyor, Chester.

COUNCIL MEETING.

At a meeting of the council held in London on April 28th the following applicants were recommended for admission:—

To Membership: Messrs. R. A. Gandy, borough surveyor's office, Bedford, and W. B. Geach, surveyor, St. Columb Rural District Council.

To Associate Membership: Mr. R. H. Hampton, borough surveyor's office, Doncaster.

New Members, &c.—From the applicants recommended for admission at the last meeting three members and one associate member were elected.

Revision of By-laws.—In view of the proposed revision of by-laws, members are requested to submit to the council any suggestions they may have to make.

B. WYAND,
Secretary.

39 Victoria-street,

The next meeting of the council will be held in London on Wednesday, May 26th, at 5.30.

SOCIETY OF ENGINEERS.

A meeting of the Society of Engineers is to be held at the Institution of Electrical Engineers, Victoria Embankment, W.C., on Tuesday next, the 11th inst., when a paper entitled "Some Future Developments in Heating and Ventilation" will be read by Mr. Arthur H. Barker, M.Inst.C., B.A., B.Sc., the following being a synopsis:

Importance of science of heating and ventilation. Nature of problems yet unsolved. Difficulties of scientific treatment of the subject.—Convection currents and radiant energy. Human physiology and psychology in relation to the subject. Inadequacy of chemical tests for air purity.—Separate functions of the engineer and of the physiologist and hygienist. Temperature of a room.—Radiant temperature.—Questions to be unravelled.—Experiments at University College.—Instruments and apparatus for measuring temperature.—Effect of dust on the human organism. Laws of air movement.

The chair will be taken at 7.30 p.m. precisely.

A. S. E. Ackermann,
Secretary.

17 Victoria-street, S.W.

ROYAL SANITARY INSTITUTE.

SHREWSBURY MEETING.

Mr. H. Percy Boulnois, M.Inst.C.E., will occupy the chair at a meeting of the Royal Sanitary Institute which is to be held at the Guildhall, Shrewsbury, on Friday, May 28th, when a discussion on "The Value of Mechanical Filters in the Purification of Water" will be opened by Dr. Thomas Orr.

The proceedings will commence at 7.30 p.m.

On the following morning inspections will be made of the Shrewsbury housing scheme, Ditherington, mechanical filters at Chester-street, and the public abattoir. The members will be entertained to luncheon at one o'clock by the mayor.

BRISTOL MEETING.

On June 11th, at Bristol Guildhall, a discussion on "Co-ordination of Military and Civil Sanitary Services in War-time," will be opened by Dr. D. S. Davies, medical officer of health, and Mr. L. S. McKenzie, Assoc.M.Inst.C.E., city engineer of Bristol.

ASSOCIATION OF MANAGERS OF SEWAGE DISPOSAL WORKS.

SOUTHEND-ON-SEA MEETING.

By permission of the town council and the borough engineer, Mr. Ernest J. Elford, M.Inst.C.E., M.I.M.E., a visit will be paid to the Southchurch Sea sewage disposal works and refuse destructor to-morrow (Saturday). Objects of interest: Grit and screening chambers; modern sedimentation tanks; roughing filters; percolating filters; pumping station and plant, including Humphrey pump; destructor works.

Programme.

2.50 p.m.—Visitors to alight at Prittlewell Station (G.E.R.) and proceed to the works (five minutes).

3.15 p.m.—Visitors will be conducted over the works by the borough engineer, who will give a description of the works.

5 p.m.—Visitors will be entertained at tea.

Visitors arriving early will find the following places of great interest—viz.: Corporation promenade pier; swimming bath; esplanades; Boulevard, Thorpe Bay and Southchurch cliffs, bandstand, &c. Trains leave Liverpool-street (G.E.R.), 1.50 p.m.; Southend to Prittlewell, 1.35, 2.0, 2.15, 3.20. Trams from Southend to Prittlewell every fifteen minutes. Visitors from works.

WIMBLEDON MEETING.

On Saturday, May 29, 1915, a visit will be paid to the Wimbledon sewage works and the S.O.S. works, Durnsford-road, Wimbledon, near Wimbledon Park Station (District Railway).

Members to meet at 3 p.m. at pumping station, Durnsford-road, to view the pumping plant, lime mixing plant, filters and sludge pressing plant, the atomisation of sewage devised by the borough engineer (Mr. C. H. Cooper, M.Inst.C.E.), and the recovery of fats resulting from such treatment. Afterwards an inspection will be made of the S.O.S. works, and the products resulting from the destructive distillation of sewage sludge.

CONCRETE INSTITUTE.

The paper by Mr. E. A. W. Phillips, M.Inst.C.E., M.C.I., entitled "Lime Concrete in the East," which was to have been read on May 6th, will be read on May 22nd, at Denison House, Westminster, S.W., at 7.30 p.m.

It has been decided to abandon the fifth annual dinner this year.

H. Kempton Dyson,
Secretary.

APPOINTMENTS VACANT.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, *but those responsible for their despatch are recommended to arrange that they shall reach* The Surveyor *office by noon on* Wednesdays *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1076) subject to later confirmation by letter.*

ASSISTANT TO SURVEYOR.—May 8th.—Maidstone Rural District Council. £2 10s. per week.—Mr. Thos. A. Bushridge, surveyor.

SURVEYOR.—May 8th.—Wirksworth Urban District Council. £90 per annum.—Mr. J. Gratton, clerk, Town Hall, Wirksworth.

ASSISTANT SANITARY INSPECTOR.—May 8th.—Corporation of Hornsey. £2 10s. per week. The Town Clerk.

GASWORKS ENGINEER AND MANAGER.—May 10th.—Spalding Urban District Council. £150, with residence.—The Clerk, Urban District Council.

CLERK OF WORKS.—May 10th.—Cheshunt Urban District Council. £2 10s. per week.—Mr. M. P. Daly, clerk.

INSPECTOR OF NUISANCES.—May 10th.—Annfield Plain Urban District Council. £130–£150. Mr. T. L. Watchman, clerk.

SURVEYOR.—May 11th.—Beddington and Wallington Urban District Council. £300 per annum. Mr. T. Booth, clerk, Council Offices, Manor-road, Wallington, Surrey.

GASWORKS SUPERINTENDENT.—May 12th.—Accrington District Gas and Water Board. £150 per annum.—Mr. C. Harrison, general manager.

ASSISTANT INSPECTOR.—May 14th.—Swansea Port Sanitary Authority. £91 per annum.—Mr. H. L. Canty, clerk, Guildhall.

BOROUGH SURVEYOR.—May 15th.—Newport (I.W.) Town Council. £225–£250 per annum.—Mr. T. Ross Pratt, town clerk.

SANITARY INSPECTOR.—May 18th.—Hayfield Rural District Council. £60 per annum.—Mr. J. R. Bowden, clerk, 16 High-street, New Mills.

INSPECTOR OF NUISANCES AND SURVEYOR.—May 18th.—Todmorden Rural District Council. £104 per annum.—Mr. F. Hollinrake, clerk, Union Offices, Todmorden.

FEMALE HEALTH VISITOR.—May 21st.—Mitcham Urban District Council. £100 per annum.—Mr. Robert M. Chart, clerk, pro tem.

SANITARY INSPECTOR.—May 21st.—Mitcham Urban District Council. £200.—Mr. Robert M. Chart, clerk, pro tem.

ROAD FOREMAN.—May 21st.—Mitcham Urban District Council. £2 per week.—Mr. Robert M. Chart, clerk, pro tem.

SURVEYOR. May 21st.—Mitcham Urban District Council. £250–£300.—Mr. Robert M. Chart, clerk, pro tem.

CLERK TO COUNCIL.—May 21st.—Mitcham Urban District Council. £250—£300.—Mr. Robert M. Chart, clerk, pro tem.

CLERK'S ASSISTANT.—May 21st.—Mitcham Urban District Council. £120—£150.—Mr. Robert M. Chart, clerk, pro tem.

CLERK OF WORKS.—Tyldesley Urban District Council. £2 10s. per week.—Mr. Francis E. Jones, engineer and surveyor, Council Offices, Tyldesley.

ASSISTANT ENGINEERS.—Public Works Department, Government of the Gold Coast. £350—£400 a year, with furnished quarters.—Crown Agents for the Colonies, Whitehall-gardens, London, S.W.

ENGINEER.—Public Works Department, British Guiana. £300—£400.—Crown Agents for the Colonies, Whitehall-gardens, S.W.

ENGINEERING AND SURVEYING ASSISTANT.—Derbyshire County Council. £150 per annum.—County Surveyor, County Offices, Derby

CLMENT INSPECTOR.—Federated Malay States Crown Agents for the Colonies, Whitehall-gardens, London, S.W.

MUNICIPAL CONTRACTS OPEN.

ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, *but those respectively for which it is recommended to arrange that they shall reach* THE SURVEYOR *by noon on* WEDNESDAYS *to ensure insertion in the weekly list of* SUMMARIES. *Such advertisements may, in case of emergency, only, be telephoned (City No. 1046) subject to later confirmation by letter.*

Buildings.

HALIFAX.—May 10th.—For erecting temporary dwelling at a school, for the Education Committee.—Mr. J. [illegible] engineer.

PUDSEY.—May 10th.—For plumber's and sanitary work at the Council Offices, for the Education Committee. Borough Engineer.

LANCASTER.—May 10th.—For the erection of an undertaker's cottage at Warrington, for the county council [illegible] Engineer, County Offices, Preston.

DARTON.—May 10th.—For the erection of boundary walls and other works, for the urban district council. Mr. S. W. [illegible]

HOLYWOOD.—May 10th.—For the construction of [illegible] Mr. J. A. Heaslip, Ocean Buildings, Belfast.

CARLISLE.—May 10th.—For the [illegible] Mr. F. Barker, surveyor.

CLAYMORRIS.—May 12th.—For [illegible] two single cottages and one double cottage, for the rural district council.—Mr. M. Cosgrave, engineer and architect.

DEVON.—May 13th.—[illegible] certain bridges, for the county council.—Mr. W. P. Robinson, county surveyor, 22 Queen-street, Exeter.

WITCHAM.—May 13th.—For the [illegible] the urban district council. Mr. J. B. Renton, surveyor.

GLASGOW.—May 13th.—[illegible] torium and children's home, for the corporation.—Mr. J. Lindsay, town clerk, Glasgow.

EAST LANCING.—May 17th.—For the erection of seven timber groynes at Shoreham, for the Sea Defence [illegible] civil engineers, 5 Little College-street, Westminster Abbey, S.W.

WITHERNSEA.—May 18th.—For the erection of a reinforced-concrete wall, for the urban district council.—Mr. J. H. B. Kirton, engineer.

DERWENT.—May 18th.—For the erection of a stable [illegible] Joint Small-pox Hospital Board.—Mr. H. B. Williams, architect, Town Hall, Workington.

WEYMOUTH.—For the erection of [illegible] town clerk.

Iron and Steel.

ST. PANCRAS.—May 11th.—For [illegible] tional work, for the borough council.—Mr. C. H. F. Barrett, town clerk.

PONTARDAWE.—May 11th.—For the supply of cast-iron water mains, with valves, for the rural district council.—The Engineer, Council Offices.

WELLINGBOROUGH.—May 12th.—For the erection of a steel Dutch barn at the sewage farm, for the urban district council.—Mr. R. S. Henshaw, engineer and surveyor.

GOSPORT AND ALVERSTOKE.—May 13th.—For the supply of a pair of 18-in. stroke horizontal cross high-pressure, double-acting air compressors, with all necessary valves, pipe connections and foundations, for the urban district council. Mr. H. Frost, engineer and surveyor, Gosport.

Roads.

JARROW.—May 8th.—For the cementing of footpaths, for the corporation.—Mr. J. Scott Weir, borough engineer, Town Hall.

MIDLOTHIAN.—May 8th.—For the supply of tools, ironmongery, brushes, oils, and other articles, for the roads department. Road Office, County Buildings, Edinburgh.

LEXDEN AND WINSTREE.—May 8th.—For the hire of one or two steam road rollers, for the rural district council.—Mr. John Ennals, surveyor, Lexden, Colchester.

NORTON.—May 10th.—For the supply of road materials and team labour, for the rural district council.—Mr. J. E. Moulding, clerk, The Edge, Sheffield.

HEBBURN.—May 10th.—For street works and extensions to reservoir, for the urban district council.—Mr. H. Lee, deputy surveyor, Council Offices.

BRIDGNORTH.—May 10th.—For the provision of horse, cart, and driver for hauling, for the corporation. Mr. J. H. Cooksey, clerk.

GREETLAND.—May 10th.—For the supply of macadam and Lancashire setts, for the urban district council.—Mr. F. J. Mallinson, surveyor.

HALIFAX.—May 10th.—For private street improvement works, for the corporation.—Mr. J. Lord, borough engineer.

COCKERMOUTH.—May 10th.—For repairs to roads, for the rural district council.—Mr. S. K. Gibson, surveyor, Grecian Villa, Cockermouth.

BERWICK.—May 11th.—For the supply of hand and machine broken whinstone and chips, for the sanitary authority.—Borough Surveyor.

SALCOMBE.—May 11th.—For the supply of 1½-in. broken blue Elvan stone, 2-in. broken limestone, blue Elvan chippings, and limestone chippings, for the urban district council.—Mr. J. G. Howard, surveyor.

MOUNTAIN ASH.—May 11th.—For the execution of street improvements, for the urban district council. Mr. W. G. Thomas, surveyor.

EAST GRINSTEAD.—May 12th.—For making good certain streets at Three Bridges, for the rural district council.—Mr. C. Turton, surveyor, 6 High-street, East Grinstead.

EAST GRINSTEAD.—May 12th.—For making up a road, for the rural district council.—Mr. C. Turton, surveyor, 6 High-street, East Grinstead.

HAWARDEN.—May 12th.—For the supply of road stones, for the rural district council.—Mr. W. Newton, district surveyor, Drury, Buckley, Chester.

WINSFORD.—May 12th.—For the supply of granite macadam and granite chippings, for the urban district council.—Mr. J. Wilkinson, surveyor.

SPENNYMOOR.—May 15th.—For the supply of tar and tarred slag, for the urban district council.—Mr. C. R. Spencer, surveyor.

MONMOUTH.—May 17th.—For the supply of materials, or for hauling stone for the repair of the main roads, for the county council.—Mr. W. Tanner, county surveyor, County Offices, Newport, Mon.

NORTH WALSHAM.—May 17th.—For the supply of broken granite and broken gravel, and road rolling, for the urban district council.—Mr. J. W. Stevens, surveyor.

WANDSWORTH.—May 18th.—For the supply of Thames ballast and sand, for the borough council.—Borough Surveyor.

WEMBLEY.—May 19th.—For making up a portion of a road, for the urban district council.—Mr. C. R. W. Chapman, surveyor.

EAST STOW.—May 19th.—For surface-water draining, kerbing, channelling, and road making, for the rural district council.—Mr. Henry E. Wilkes, clerk, [illegible]

Sanitary.

LANCHESTER.—May 10th.—For cleansing privies and ashpits, for the rural district council.—Mr. J. R. Lupton, Lanchester, Durham.

MORLEY.—May 18th.—For work of sewering, for the corporation.—Mr. F. Turner, borough engineer and surveyor.

BRADFORD.—May 18th.—For supplying and cleansing middens, for the corporation. Superintendent Call, Hammerton-street Depot.

FINCHLEY.—May 31st.—For the construction of soil and surface-water sewers in connection with the Woodhouse estate workmen's dwellings scheme, for the urban district council.—Mr. C. J. Jenkin, engineer and surveyor.

DORCHESTER.—For the supply of new or second hand screening and media washing machine, also hard burnt clinker or other filtering material for percolating filters, for the corporation.—Mr. H. D. Strange, borough surveyor.

Miscellaneous.

BIRKENHEAD. May 12th.—For the maintenance of 120 coal wagons belonging to the gas department, for the corporation.—Mr. T. O. Paterson, gas engineer, Gasworks, Thomas-street, Birkenhead.

TENDERS FOR MUNICIPAL WORKS OR SUPPLIES.

The Editor invites the co-operation of SURVEYOR *readers with a view to making the information given under this head as complete and accurate as possible.*

* Accepted. † Recommended for acceptance.
‡ Provisionally accepted.

ALDERLEY EDGE.—Accepted for the supply of 240 tons of tar-macadam, for the urban district council. The Surveyor:—

Tarmac, Limited, Wolverhampton, 14s 6d. per ton.

BEATH.—Accepted for the erection of a school, for the School Board. Mr G. C. Campbell, architect, Methil, Fife:—

Mason Work.—A. Kinnear, Lundin Links, £3,519.
Joiner Work.—J. King & Co., Lochgelly, £2,854.
Slater Work.—J. Paul & Sons, Cowdenbeath, £530.
Plaster Work.—J. Adams, Lochgelly, £754.
Plumber Work.—S. Binning, Cowdenbeath, £910.
Asphalt Work.—F. B. Flood, Edinburgh, £191.
Smith Work.—J. Lessels, Dunfermline, £165.
Painter Work.—J. Millar, Leslie, £216.
Tile Work.—W. Field, Edinburgh, £152.
Heating.—Taylor & Fraser, £607.
Ventilating.—Donald & Donald, Glasgow, £126.
Electric Light.—Moncrieff Brothers, Methil, £187.

CRANBROOK.—For the construction of sewage disposal works, for the rural district council. Mr. J. H. Bailey, sanitary surveyor:—

Economic Drainage Company, London, S.W.	£767
Vine, Tunbridge Wells	606
S. F. Stanley & Sons, Marden*	596

HESTON AND ISLEWORTH.—For the supply of tar and Tarvia, for the urban district council.—Mr. J. G. Carey:—

TAR.

	Per gallon.
	d
Catchpole & Sons, London	4
Forbes, Abbott & Co., Limited, London	4¼
Grindley & Co., Limited, London	4¼
T. Clayton (Oldbury), Limited, Brentford	3¾

TARVIA.

Bristowe & Co., Limited, London	3¾

HOLLINGBOURNE.—For the construction of a sewer and manholes, for the rural district council. Mr H. M. Apps, sanitary inspector:—

Barden & Head, Maidstone	£83
N. T. Burrows, Maidstone	63
A. Tong, Harrietsham, Kent*	46

PETERBOROUGH.—For the supply of broken granite, granite kerb, and granite channelling, for the corporation.—Mr. J. W. Walshaw, city surveyor.

Broken Granite.—Enderby Granite Company, Leicester. Groby Granite Company, Leicester.

UXBRIDGE.—For the construction of a sewerage scheme, for the rural district council.—Mr. J. W. Harrison, engineer and surveyor:—

W. Jackson, Forest Gate	£1,012
Economic Drainage Company, Limited, London	997
J. C. Turner, Blackwater, Hants	936
E. & E. Iles, Wimbledon	908
T. W. Pedrette, Enfield ..	899
Payne Brothers, Watford	889
G. Wimpey & Co., Hammersmith ..	861
Willis & Powis, Wembley	861
W. Lingwood, junr., Romford	861
Lovell & Sons, Gerrard's Cross, Bucks	855
Langley & Johnson, Slough, Bucks ..	825
W. Wright, Chesham, Bucks ..	814
A. & B. Hanson, Southall, Middlesex	789
	782

UXBRIDGE.—For the erection of a corrugated-iron bathing shed, for the urban district council.—Mr. W. L. Eves, surveyor:—

H. & G. Pratt, Uxbridge	£180
Payne Brothers, Watford	127
J. McManus, Hammersmith	115
Palmer & Co., Merton Abbey	114
L. Aston, Uxbridge	112
J. Wallis & Co., Rickmansworth	110
S. Butler, Chesham	108
Lovell & Sons, Gerrard's Cross	97
W. S. Try, Cowley	85

WANDSWORTH.—For making up part of a road, for the borough council.—Mr. P. Dodd, borough engineer:—

Willis & Powis, £1,546, and 10 per cent. above schedule prices for extras or omissions.

WHITSTABLE.—Accepted for the supply of flints, hoggin, brick rubbish, sand, ballast, crushed flints, tar, cement, tar-macadam and steam rolling, for the urban district council. Mr. F. Laurens, surveyor:—

Finn & Co., Canterbury. Steam roller hire, 2s 6d. per hour; 25s. per day.
Thames Sand and Dredging Company, London. Crushed ballast, 3s. 6d. per ton.
Cremer, Goodenough & Co., Faversham. Flints, 4s. 10d. per yard; hoggin, 3s. 10d. per yard; sand, 4s. per yard; brick rubbish, 3s. 8d. per yard; ballast (Brightlingsea), 4s. 6d. per yard.

WITHAM.—For the supply of granite chippings, for the urban district council.—Mr. W. P. Perkins, surveyor:—

	s. d.
Johnston Brothers, London	16 2
Brookes, Limited, London	15 10
W. Griffiths & Co., London	15 0
Whitwick Granite Company, Leicester	14 11
Lavender & Bateman, Leicester	13 9
Croft Granite, Brick and Concrete Company, Leicester	12 6
Enderby and Stoney Stanton Granite Company, Leicester	12 6
C. Abell, Limited, Atherstone ..	12 3
Jees Hartshill Granite Company, Atherstone*	12 3

MEETINGS.

Secretaries and others will oblige by sending early notice of dates of forthcoming meetings.

MAY.

7.—Junior Institution of Engineers: Informal Discussion 39 Victoria-street, S.W., 8 p.m.
8.—Institution of Municipal and County Engineers: Meeting at Scarborough.
11.—Society of Engineers: Mr. Arthur H. Baker, WH.SC., B.A., B.SC., on "Some Future Developments in Heating and Ventilation." Institution of Electrical Engineers. 7.30 p.m.
22.—Concrete Institute: Mr. E. A. W. Phillips, M.INST.C.E., on "Lime Concrete in the East." 7.30 p.m.
26.—Institution of Municipal Engineers: Council Meeting in London. 5.30 p.m.
28.—Institution of Municipal and County Engineers: North-Western District Meeting at Northwich.
28.—Royal Sanitary Institute: Meeting at Shrewsbury. Discussion on "The Value of Mechanical Filters in the Purification of Water." 7.30 p.m.
29.—Institution of Municipal and County Engineers: Council Meeting.
29.—Association of Managers of Sewage Disposal Works: Visit to Wimbledon Sewage Works.

JUNE.

4-5.—Institution of Municipal and County Engineers: Scottish District Annual Meeting at Ayr.
11. Royal Sanitary Institute: Discussion on "Co-ordination of Military and Civil Sanitary Services in War-time." Bristol Guildhall.
12.—Institution of Municipal and County Engineers: Meeting at Matlock.
24-26.—Institution of Municipal and County Engineers: Annual General Meeting.
25.—Mr. Herbert Samuel opens the National Road Exhibition.

APPOINTMENTS OPEN.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* WEDNESDAYS *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

ENGINEERING AND SURVEYING ASSISTANT required for period of the war. Good draughtsman, accurate surveyor and leveller, competent to draft specifications, and with experience in bridge work. Preference given to one disqualified for military duty. Salary at the rate of £150 per annum, payable monthly. Write full particulars as to age, experience, and when available to the County Surveyor, County Offices, Derby. (2,556)

BEDDINGTON AND WALLINGTON URBAN DISTRICT COUNCIL.

SURVEYOR.

The above Council invite applications for the appointment of Surveyor to the Urban District. The approximate area of the district is 3,200 acres; rateable value, £120,000; population, 15,300.

The salary will be £300 per annum, and the person appointed must devote the whole of his time to the duties of his office, and not engage in any outside work.

Applicants, who must be over 25 and under 45 years of age, must be thoroughly qualified to undertake all duties in connection with the office of Surveyor to an Urban Authority.

Applications, in candidate's own handwriting, stating age, experience and qualifications, accompanied by copies of not more than three recent testimonials, and endorsed "Surveyor," must reach me not later than 12 noon on Tuesday, 11th May next.

Canvassing in any form is strictly prohibited, and will be deemed a disqualification.

T. BOOTH,
Clerk to the Council.

Council Offices,
Manor-road,
Wallington,
Surrey.
April 28, 1915. (2,558)

The Surveyor

And Municipal and County Engineer.

Vol. XLVII. MAY 14, 1915. No. 1,217.

Minutes of Proceedings.

Sanatoria.

The [illegible] part of the annual report of the Local Government Board for 1913-14, which has recently been issued, deals, among other things, with a variety of questions connected with public health and local administration. Not the least important of the matters discussed under this heading are those concerning the prevention and treatment of tuberculosis. In regard to the provision of new sanatoria, two memoranda have been issued by the board during the year under review. The first of these was concerned with the construction and arrangement of inexpensive buildings for the treatment of cases of tuberculosis, while the second dealt with the considerations to be taken into account in the selection of sites. Both of these useful memoranda were noted in these columns at the time they were issued, and both have been of great assistance to local authorities in the provision of buildings required to meet pressing needs for new accommodation for the residential treatment of tuberculous persons.

The board state that they have found it essential, in expressing an opinion on the merits of a site, to explain that if local opposition is raised it may be necessary for them to hold a public inquiry before coming to a decision on the question of formally approving the purchase of the site or sanctioning a loan for the purchase. Local objections have been raised in a considerable number of cases, and in a few instances pressure has been put on the selling landowner to withdraw from his provisional offer on the ground that injury would be caused by the establishment of a sanatorium on the site in question to the health, amenities, or rateable value of the neighbourhood. In some cases, it seems that a real although unfounded dread of infection has inspired the opposition, especially among some of the less well-instructed persons in the vicinity. In others, motives of monetary interest have predominated. In contrast to this, there have been cases where the community have welcomed the establishment of a sanatorium as likely to lead to a considerable increase in rateable value of the parish in which the institution is to be erected. The board have also received objections in several instances to the establishment of dispensaries in towns, on the ground that the existence of such institutions in the midst of a large population might be prejudicial to the health of the neighbouring community. All objections which have been raised have been carefully considered, but with regard to the fear of infection the board have emphasised the opinions unanimously arrived at by the Departmental Committee on Tuberculosis in their interim report, that "there is no danger of infection being conveyed from the dispensaries to the occupants of neighbouring houses," and, in their final report, that "a properly conducted institution for the treatment of tuberculosis is not a source of danger to the neighbourhood."

In regard to the provision of hospitals, the board point out that it was stated in their last annual report that in many cases they had approved the use of infectious diseases hospitals for the treatment of tuberculosis where they were satisfied that the arrangements for the treatment of acute infectious diseases would remain fairly adequate, and they indicated the conditions on which they had approved of the use of small-pox hospitals for this purpose. In a number of cases during the past year local authorities have been able to free their small-pox hospitals for the treatment of tuberculosis, except in the event of a large epidemic of small-pox, by making suitable provision elsewhere for the treatment of sporadic cases of small-pox occurring in their districts; and, in some instances, in order that a small-pox hospital may be permanently devoted to the treatment of tuberculosis, arrangements have been made by which any cases of small-pox occurring in the district served by the hospital will be treated at some other small-pox [illegible]

An Irish County Surveyor's Ordeal.

We have heard a good deal lately about the position and remuneration of Irish county surveyors. Neither was considered satisfactory by fair-minded people; it was, indeed, quite evident that there was room for considerable improvement in the conditions applying to the employment of these responsible officials. This is a phase of the subject of Irish county surveyorships which calls for and duly receives the sympathy of reasonable people. There would appear to be yet another phase that demands more drastic treatment than mere sympathy, and this is the manner in which county surveyors in Ireland are maligned, browbeaten, insulted, and intimidated by local councillors while engaged in the discharge of their duty. A very glaring instance of this was supplied recently at Ballinasloe—whether it was the urban or the rural council is not clear from the report of the proceedings in the local paper—when the county surveyor, Mr. M. T. Kennedy, appeared and gave his quarterly report on the condition of the local roads. In this he called attention to the growing practice among contractors of tendering only for fancy and easily-maintained roads, and leaving those which were allowed to deteriorate for years in his hands. He declared frankly that he would decline to allow the continuance of such a state of things any longer, and stated that every road must have its contractor or he would be compelled to introduce a direct labour scheme over the whole district. With respect to the quality of the work done, he pointed out that a large number of contractors deferred spreading the materials "till the last minute of the quarter," with the result that sheets of stones that by now should be

incorporated with the whole, within the road surface, are scattered over the road, and will have to be raked off again. He warned contractors that unless they altered their methods they would be regarded as defaulters.

This and the construction of a road as to which it appeared the local contractors were in hopeless disagreement was the signal for some extraordinary, not to say amazing, scenes. The contractors, whose elemental passions appear to be constantly simmering on the surface, had their turn first, and while one appealed to the devil to curse the district road they would ever make again, owing to the manner in which the county surveyor treated them, a second told that official to "go to hell with himself and itself," while yet a third, as we read, "nearly went into hysterics" when he was informed that his account had been reduced owing to his neglect. After this it was the councillors who sought to improve the occasion, and one gentleman in particular, Mr. Lynskey to wit, distinguished himself beyond the others in the fury of his onslaught. Referring to the case of a widow who had had £6 struck off her account, he shouted in the face of the county surveyor, "There is no justice done to her, and, mark my word, the curse of the widow and orphans is on your head to-day," adding, after further frenzied abuse, "and there would not be a God in heaven if you were not made an example of, and you will, and that before long." Mr. Lynskey cursed so loud and so long that one is forcibly reminded of the prelatical maledictions incurred by the jackdaw of Rheims in circumstances of peculiar aggravation. It is only fair to say that Mr. Kennedy met this rhetorical tornado with the outward serenity of a philosopher, but all the same it must be very trying to undergo such a verbal bombardment as he was the victim of upon this occasion. Protection from such unwelcome ordeals might perchance become effective if the county council took steps to indict some of the offenders for making use of threats, which, however contemptible and empty they may seem, are highly offensive to an official who is endeavouring to do his best under very trying and difficult conditions.

* * *

The Drifting Sand Filter.

The chief difficulty in connection with the mechanical filter is in the cleansing of the sand. Inasmuch as the sand has to filter a much larger quantity of water within a given time than is the case with the slow sand filter, its surface becomes clogged more rapidly in proportion and must be cleansed frequently. At such times as the filter becomes inoperative another filter must be used, and time must be taken for cleansing. The *Canadian Engineer* contains a description of a filter designed on a new principle for use at Toronto. By this new principle the surface of the filtering sand body is removed continuously, and is washed and replaced automatically. Thus the upper surface of the filter consists of a stratum of drifting sand which is continuously drawn off, washed, and pumped back into the filter with the raw water. A filter capable of dealing with 500,000 gallons per day was erected at the old West Toronto pumping station recently, and was tested almost continuously for thirty-six days. In this case the raw water is drawn from Humber Bay, in Lake Ontario, by means of a centrifugal pump. The water is delivered, together with a continuous supply of sand (the sand circulating from the filter through a sand washer), to the top of the filter. The filter consists of a vertical cylinder of reinforced concrete, deeper than is usual for mechanical filters. The filtered water is collected at the bottom in small hoppers filled with graded gravel held in place by means of brass screens. At a distance of 2 ft. 6 in. above the underdrain system and all round the circumference of the filter are a series of hopper-headed posts down which the drifting sand and water passes. These run to one ring of pipes, along which the wash water and sand pass to a sand washer or separator.

The notable feature is that this sand washer is attached to the filter supply pipe—the pumping main—immediately over a constriction in the pumping main on the filter side of the pump like the constriction in a Venturi meter. Owing to the well-known fact that the pressure in the constricted pipe is less than elsewhere, and less than in the filter, the difference is sufficient to draw the loose sand charged with dirt out of the filter into and through the sand washer, and thence into the supply pipe, whence it passes again into the filter. The weight of the sand carries it to the bottom of the washer, and thus into the pumping main, but the dirt in suspension in the water escapes from the washer at the top. The whole arrangement is very ingenious, and apparently it is quite effective, as may be judged from the recorded results, and it may well be that we have here the application of a new principle which will lead to considerable economy, for it is apparent that if this filter continues to give good results we have something which will materially lessen the first cost of filter installations, and which should also reduce the running expenses. In addition, it should result in a constant rate of working. Further application of the method will certainly be noted with considerable interest.

* * *

The Scarborough Meeting.

Since the Institution of Municipal and County Engineers last visited Scarborough—some nine years ago—the corporation have embarked on a variety of schemes for the improvement of the town and the attraction of the holiday-maker, and these, in course of time, will doubtless be found to be profitable investments from the point of view of the ratepayers. In the existing circumstances immediate benefits are extremely problematical. In common with other towns on the eastern shores of this country Scarborough appears to be resigned to the inevitable falling-off in the number of its visitors during the coming "season," but it may be expected that the bombardment of December last will not be without its compensations providing, as it has done, a number of new "show places" which will not fail to interest the visitor to the town in days to come. At all events, the meeting of the Institution of Municipal and County Engineers, which was held in the town on Saturday, was of peculiar interest. It was devoted almost entirely to inspections of new works and visits to a number of the points which suffered as a result of the German raid. To the municipal engineers of sea coast towns in particular the meeting must have been one of the very greatest interest and value, Scarborough having to face what seem to be almost insurmountable difficulties owing to the erosion of the coast that is continually going on.

The paper read by Mr. Harry Smith, ASSOC.M. INST.C.E., the borough engineer, dealt with the subject of "Catering for the Wants of the Holiday-maker," and will be found in another column. As a matter of policy the corporation have limited themselves to providing the necessary buildings, fittings and furniture for all musical and theatrical entertainments, and have then leased them to experienced caterers, the leases containing clauses designed to safeguard the character and nature of the performances given. In regard to games, on the other hand, the council have run them entirely under municipal management and control. Mr. Smith gave descriptions and details concerning the Alexandra Gardens, Peasholm Park, Peasholm Undercliff and South Cliff Gardens, and also in relation to the new bathing

pool. There can be no doubt that sea bathing is a most important item in the programme of the holiday maker at any modern seaside resort, and that the question of the provision of modern bathing pools in the case of artificial pools in which the pastime may be indulged with safety will have to be faced in many places. Scarborough has given an excellent lead in this respect, the scheme prepared by Mr. Smith providing for a pool of oval shape extending along the shore for 350 ft. and seawards for 190 ft. The work of construction was commenced in 1913, and is now rapidly nearing completion. Altogether, those who were able to be present at the meeting spent a most interesting and instructive day.

* *

British Fire Prevention Committee's War Emergency Work.

Particulars have been furnished us of the war emergency work done by the British Fire Prevention Committee during the first nine months of the war. The committee's Special Fire Survey Force of honorary surveyors have surveyed in detail some 500 establishments taken over for war emergency work. The character and extent of these establishments varied, but often included extensive groups of buildings. In each case the hon. surveyors' reports, which are prepared on special lines and accompanied by sketch plans, serve as a basis for the detailed written reports by the authorities subsequently prepared at the committee's London headquarters. The committee's War Enquiry Office has dealt with numerous technical enquiries. This work sometimes included matters of a highly technical character for the authorities, and at other times the ordinary enquiries of members of the public. The committee's Warning Service embraces the preparation and issue of a large number of public "fire warnings" disseminated by the committee in the form of posters, notices, circulars issued by technical societies. The issue of these posters involved not only a careful distribution with directions and advice, but also involved, as a rule, an extensive correspondence on technical points. Practical hints regarding the posters have also been issued for application by the Executive of the British Fire Prevention Committee. Hon. surveyors, Special Fire Survey Force, appointed by the committee, and comprising experienced officers and firemen, are brought into such a form as to make 200 inspections with the necessary appliances, readily available for mobilisation at a moment's notice, day or night. Calls upon this force have so far only been made to a moderate extent for fire patrols. The whole of the complex work arising out of the above has been carried out by the hon. officers of the committee and a small clerical staff without materially interfering with the routine work of the organisation. In the conduct of this war emergency work the committee met with considerable encouragement from the authorities, the various offices and corporations concerned having frequently expressed their appreciation of the services rendered.

Heating and Ventilating.

The twin sciences of heating and ventilation formed the subject of a paper of great value and interest which was read by Mr. A. H. Barker, M.Sc., at the last meeting of the Society of Engineers. Many of the difficulties which confront the engineer in connection with these problems are due to the personal idiosyncrasies of the occupants of the room or building with which he is dealing, and to that extent are virtually insurmountable. All that the engineer can reasonably be asked to do is to produce and control certain specified conditions. This in itself is a serious engineering problem, and the primary object of Mr. Barker's paper was to show that it is capable of investigation upon exact scientific lines. The questions to be determined are complex. Thus, efficient ventilation depends not only upon the introduction into a building of a calculated volume of air per hour, but also upon a correct understanding of the distribution of air currents, while the problem of heating is complicated by the essential distinction between convected and radiant heat. In the latter connection Mr. Barker pointed out most clearly the fallacy of attempting to measure the warmth of a room from the point of view of the occupants by means of an ordinary thermometer for taking the temperature of the air immediately surrounding it, and explained his original conception of "radiant temperature." This may be defined as the temperature which a thermometer would register if there were no air in the room at all, or, in other words, a sort of mean of the temperature of the surrounding walls.

The instruments devised by Mr. Barker for measuring this "radiant temperature" and for determining the air temperature are of a very ingenious character, and his experiments go to bear out Dr. Leonard Hill's theory that, physiologically speaking, the chemical composition of air has within wide limits no effect whatever on the human organism. A further important point in connection with ventilation is to determine the effect of the presence in air of dust in considerable quantities, and a necessary preliminary to any such investigation is to be able to ascertain with some degree of accuracy how many particles of dust in fact exist in a particular sample of air. Mr. Barker gave an interesting description of the Aitken dust counter, invented for this purpose—an instrument based upon the principle of measuring off a certain minute sample of air and diluting it largely with a measured quantity of pure and dustless air. There can be no doubt that there is considerable need for the investigation of problems connected with heating and ventilation on scientific lines, and the work accomplished by Mr. Barker and described in his paper forms a valuable contribution to the progress of these important branches of engineering practice.

A Prize Design.

On another page in this issue will be found the drawings and description of the design for the lay-out of a park and recreation ground which was awarded the first prize in a competition recently organised by the Council of the Institution of Municipal and County Engineers. The successful design was the joint work of Mr. W. H. Price, of the City Engineer's Office, Birmingham, and Mr. A. J. Price, of the Borough Engineer's Office, Eccles, who are to be congratulated on a work which bears the marks of thoroughness, boldness, and originality. The area to be dealt with amounted to some 240 acres, so that there was ample space to provide for a variety of sports, games, and other attractions, and of this the designers have taken the fullest advantage. Absolute freedom of treatment was restricted by the conditions of the competition, which provided that a main avenue and stream should run diagonally across the site, intersecting each other at the centre. The successful design deals with this limitation in a masterly way, the whole scheme being dominated by these main features. The provision of a stadium large enough to accommodate from 120,000 to 150,000 persons is a bold feature, while a plot of 20 acres is provided for cricket, football, and polo, with a large pavilion to accommodate the various clubs using the ground. The idea of the competition was an excellent one, and the award of the prize is abundantly justified by the excellence of the successful design.

Design for the Lay-out of a Park and Recreation Ground.

By W. HENRY PRICE, City Engineer's Office, Birmingham, and ALFRED J. PRICE, ASSOC.M.INST.C.E., Borough Engineer's Office, Eccles.

[Awarded First Prize under the Institution of Municipal and County Engineers' Premium Scheme, 1913-14.]

In the design accompanying this description an effort has been made to provide a lay-out for a park and recreation ground which will not only embrace and preserve the best natural features of the site, but will also meet the new conditions called for by the great popularity of all outdoor sports, and the more intellectual forms of recreation in which the naturalist, botanist, art student, scientist, littérateur, or music lover may join.

The main avenue and stream, which, by the conditions of the competition, run diagonally across the site, intersecting each other at the centre, dominate the whole design, and the various roads, gardens and sports grounds are arranged so as to fit in conveniently, and harmonise, as far as possible, with the lay-out of the main avenue and stream.

The main avenue is 80 ft. wide, and has two lines of roads, each 30 ft. wide, divided by a central 20-ft. plot of flower beds, and bounded on each side by a 30-ft. grass plot, and a 20-ft. footpath, shaded by a double line of lime trees, as shown on the section.

Two secondary circular roads, of the same radius and 40 ft. wide, skirt the edges of the park, meeting tangentially at the central circus and clock tower, and with the connecting 40-ft. roads give convenient access to the park by the subsidiary gate entrances.

There is also a 40-ft. road on the north side of the lake, and these roads, which are essentially carriage drives, and the carriageways in the main avenue, are to be laid with tar-macadam, this being the most suitable material for the light motor traffic which has practically superseded horse traffic.

Tar-macadam is also desirable from the hygienic and economic point of view, as it protects pedestrians from the dust nuisance, and is more durable than the gravel of which the narrower roads and walks are formed.

The stream, which at the north-east angle of the park is narrow and irregular, gradually widens out at the centre of the park to a width of 100 ft., and passes under the central circus by a double line of watercourses which are culverted. These streams emerge at the centre of the road, forming a circular ornamental basin practically surrounding the clock tower, and then passing by another double line of culverts to the south side of the circus, emptying into the boating lake of about 12 acres.

This lake will, to a great extent, follow the natural contour of the ground, and will have a depth varying from 18 in. at the sides to 3 ft. in the middle. The excavated material will be useful for forming islands and mounds and undulations in the woods and shrubberies enclosing the lake. The bottom of the lake is to be concreted for about 10 yds. from the edge, and puddled for the rest of the site, if required.

A waterfall is formed on the upper part of the stream near the botanical gardens, and a weir, to hold the lake up to the required level, is constructed at the south-west portion of the stream near the lower part of the lake.

Open-air baths and covered swimming and slipper baths for ladies and gentlemen are formed on the banks of the lake, and a boat-house, with landing-stage, terrace and café, are also located on the north side of the lake.

The park is surrounded by clumps of forest trees and shrubs, and the stream and lake are also enclosed with woods, which not only add to the picturesqueness of the stream, but also provide shady walks and glades and shelter from sun or wild weather.

Ornamental flower gardens are formed near the bandstand, museum, cricket pavilion and palm-house, and botanical gardens for tropical and other rare plants, with suitable glass-houses, pergola, trellis work and roseries are located to the north of the stream and clock tower.

A palm-house and ornamental gardens, in which a sundial and lily pond are provided, are placed to the south-east of the lake.

Zoological gardens adjoin the botanical gardens, and are arranged with open-air enclosures for the animals to roam about freely, the dens, or lairs, being formed in the rockwork under the hill. A bear pit, with access from the open-air enclosures and lairs, a monkey-house, aviary, aquarium and reptile-house are also provided.

A sunk bandstand is located to the north of the clock tower, and a concert hall, which may be used by the band in bad weather, or for classical or other concerts, is provided as part of the museum and art gallery buildings.

The provision of art galleries and museums in public parks has been largely adopted of late years, and the study of art and science has an additional interest amid such pleasant surroundings.

In a park of 240 acres it is not only possible, but desirable, to make provision for the majority of the recognised forms of sport and athletics. If we are to take an honourable position in the Olympic games, or encourage and help the Boy-Scout and other similar movements, it is necessary that we should have an Olympic centre, which will enable our athletes of the younger generation to emulate the deeds of our immediate ancestors.

The stadium is large enough to accommodate from 120,000 to 150,000 persons, which, in these days of Final Football Cup-ties, is not too large a size. It provides two large covered seated stands, with uncovered standing accommodation at the ends. A gymnasium, which can also be used for dressing or drill purposes, adjoins the northern stand. A swimming pond for swimming and diving contests, a concrete cycle track, a cinder track for running, with turf enclosure for running or football are provided in the stadium. The covered stands contain refreshment-rooms, club-rooms, dressing-rooms and lavatories, and the lower portions of the open stands could be utilised for garages, refreshments, stores or conveniences.

Four public and two club bowling greens, eighteen public and twelve club tennis courts, together with croquet lawns, are provided.

A plot of 20 acres is provided for cricket, football and polo, with a large pavilion to accommodate the various clubs using the ground.

A clock and observation tower with electric lift is placed in the central circus, which is easily seen from all parts of the park, and which forms the focal point of various roads, and makes a pleasing vista from both ends of the main avenue and lake.

Boys' and girls' playgrounds, in which would be placed swings, parallel bars, and the usual simple gymnastic apparatus found in these grounds, with shelters, &c., are provided, together with a paddling pool with guard rail in the lake for the younger children.

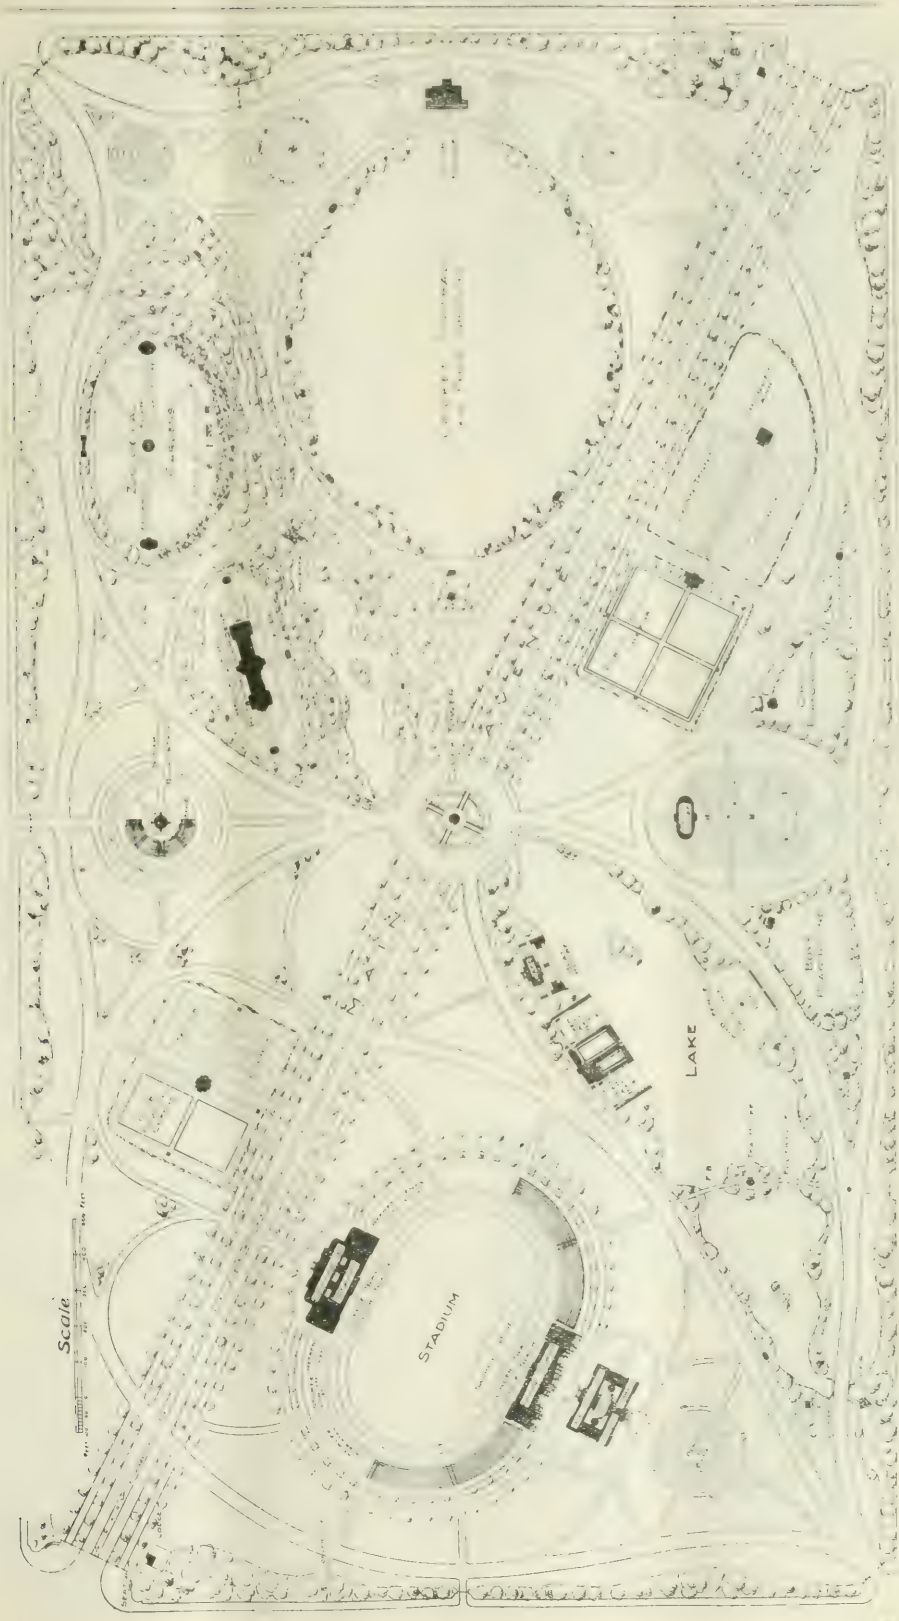
A number of shelters are placed at suitable points in the park, and the sanitary conveniences are usually screened by shrubberies. Besides the café at the boat-house and refreshment-room at the stadium, a tea-house is provided on the largest island at the south end of the lake.

Two park-keepers' lodges are built at the entrances to the main avenues, and it would, in . . . days of Suffragette outrages, be advisable to provide living accommodation for some of the park attendants in the cricket and tennis pavilions, boat-house, baths, tea-houses, stadium and art galleries.

The park entrances have wrought-iron gates, with stone piers of a suitable architectural character, and the smaller gates and railings would harmonise with them.

The detail drawings, though only drawn to the small scale of 20 ft. to an inch, are sufficiently clear to indicate the architectural character of the buildings, and the engineering and landscape details. While an attempt has been made to provide in the art gallery, museum, clock tower and bandstand building of a classic character suitable for the purpose they serve, the stadium, cricket pavilion, boat-house, and other buildings have been designed in a somewhat quieter and more modern style of architecture.

The domes on the concert hall, clock tower and



Design of Messrs. W. H. & Alfred J. Price for a Park and Recreation Ground.

bandstand are formed in concrete and covered with copper, and the palm-house and conservatories in the botanical gardens are of glass with steel framework, which are materials, perhaps, not allowing of the best or purest style, but are still of the most useful character for the purpose they serve. The designs are sufficiently varied to avoid monotony, and it is hoped that they do not offend any of the recognised canons of architectural taste.

The question of cost cannot be ignored, even in a competition such as this, and while an effort has been made to avoid anything of a cheap and shoddy character, yet extravagance in the buildings or layout has been carefully avoided as far as possible, and it is hoped that a design for a park and recreation ground worthy of a large and important town has been provided.

HEAVY TRAFFIC.

COUNTY COUNCILS ASSOCIATION'S PROPOSALS.

The following are the heads of evidence to be given on behalf of the County Councils Association before the Departmental Committee on Locomotives and Heavy Motors (Damage to Roads), so far as such evidence is admitted by the committee:—

(1) LOCOMOTIVES AND HEAVY MOTORS.

(*a*) It should be rendered impossible for the same vehicle to be registered at the same time as a heavy locomotive and a heavy motor car.

(*b*) Means should be provided by which the drivers both of heavy locomotives and of heavy motor cars can be made aware of vehicles coming up behind by placing a man at the rear, or by a reflector or otherwise.

(2) HEAVY LOCOMOTIVES.

(*a*) The size and weight of locomotives and trailers, and of the weights to be carried by the latter, should be restricted. The weight upon any one axle should be regulated according to diameter of the wheel and width of tyre, and the ratio of weights to the diameter and width of tyre should in no case exceed that which it is recommended should be adopted for the Heavy Motor Car Order.

(*b*) The weight of a traction engine should be defined as the gross load upon the road, including full supply of water, fuel, &c., such gross load to be ascertained and certified by the county or county borough council, who should issue a plate indicating such weight for affixing to the engine.

(*c*) As the Heavy Motor Car Order prohibits projecting diagonal cross-bars on driving wheels, and narrow bands round front wheels of heavy motors, and these vehicles have been proved to work satisfactorily, similar restrictions should be applied to traction engines.

(*d*) The use of a safety-chain coupling should be required in addition to the ordinary draw-bar and an adequate brake.

(*e*) It should be provided that the county surveyor shall be notified seventy-two hours prior to the traversing of any roads in his county by an engine or engines hauling an indivisible article exceeding 16 tons in weight, and that he shall forthwith notify the district surveyors concerned.

(*f*) County and county borough councils should be given power by by-law to regulate or prohibit the use of locomotives on highways when under repair or upon the break-up of a frost, and all other road authorities should be authorised to take proceedings for the enforcement of such by-laws when made.

(*g*) Drivers should be obliged to be licensed under conditions identical with those imposed upon heavy motors.

(*h*) Annual licence fees should be fixed at, say, not less than £20, to be identical throughout the kingdom, the proceeds to be distributed among road authorities on an equitable basis.

(*i*) Any locomotive habitually let out for hire should not be an agricultural locomotive within the meaning of the Act.

(*j*) The daily travelling fee should be fixed at 10s., and it should be provided that no locomotive weighing more than 14 tons shall be used on the highways of any county or county borough in which it is not licensed unless the owner thereof has first obtained the consent of the licensing authority for such county or county borough or their surveyor.

(3) HEAVY MOTOR CAR.

(*a*) In determining the weight of a car should be provided that the weight unladen should be the maximum gross weight upon the road when in full working order, including full supply of water, fuel, accumulators, &c.

(*b*) The regulations with regard to the weights to be carried on all classes of vehicles should be amended, such weights being based on considerations of width and type of tyres, diameter of wheels and speed. The unit of 840 lb. per inch width of tyre of a 3-ft. diameter wheel used in the Heavy Motor Car Order, 1904, to arrive at the axle weight permissible, is excessive, and should be reduced to 616 lb. per inch, increasing 1 cwt. per additional foot in diameter of wheel, as in present Order. This would make the weight per inch very similar to that permitted in the heaviest traction engines by the Highways and Locomotives Act, 1878.

NOTE.—Whereas the Local Government Board's circular letter of December 28, 1904 (second paragraph, page 2), assumes that "two-thirds of the load may ordinarily be expected to be carried on the axle to which the driving power is directly applied," it is undoubtedly a fact that makers of heavy motors now construct them so that quite three-fourths of the weight is upon the back axle (a reference to advertisements in trade journals makes this abundantly clear), and therefore the registered axle weight, itself excessive, is constantly exceeded.

(*c*) It should be required that every application for the registration or licensing of a heavy motor car be accompanied by a statutory declaration of its weight.

(*d*) Power should be given to any registering authority to weigh any car on any available weighing machine within 2 miles of the spot where the car is stopped.

(*e*) Power should be given to road authorities to prevent heavy motor cars and other light locomotives stopping on bridges to take in water.

(*f*) An adequate licence fee, identical throughout the kingdom, should be payable in respect of heavy motor cars, the proceeds to be distributed among road authorities on an equitable basis.

(4) TRACKLESS TROLLEYS AND MOTOR OMNIBUSES.

(*a*) The proprietors of all trackless trolleys or motor omnibuses should be liable to contribute towards the maintenance of the roads over which they run.

(*b*) Power should be given to road authorities to regulate the running of such vehicles over their roads.

(5) EXTRAORDINARY TRAFFIC.

(*a*) Power should be given to a highway authority which has reason to believe that damage may be done to a highway by extraordinary traffic to apply to justices or the county court to prohibit such traffic until the persons responsible give sufficient security to cover such possible damage as, in the opinion of the Court, may be done, and the road authority should have power to require the amount of security to be increased from time to time where the traffic extends over a considerable period.

(*b*) All disputed claims for damage for extraordinary traffic in England, Wales and Scotland should come before a special tribunal (whose decision should be final) to be appointed in each case by the Road Board, and to consist of two qualified engineers and a legal representative.

London and Lancashire Fire Insurance Company.—The annual report of the London and Lancashire Fire Insurance Company, Limited, shows a successful year's working. The nett realised profit in the fire department was £146,033, in the accident department £80,150, and in the marine department £22,573—an aggregate of £248,756. A sum of £180,300 is placed to reserve, which has now reached the handsome total of £3,466,344. The total security to policy-holders now amounts to no less than £6,107,594.

Protection of Contractors.—In the House of Commons, on the 6th inst., Sir Alfred Mond asked the Prime Minister whether he could see his way to cause regulations to be issued under the provisions of the Defence of the Realm Consolidation Act, 1914, relieving any person or firm of legal proceedings when, having both Government and civil contracts, preference was given to Government contracts at the risk of breaking the civil contracts. The Prime Minister said regulations would not be effective for the purpose suggested. The Defence of the Realm (Amendment) No. 2 Act, which was passed on March 16th last, already gave effect to the proposal of his hon. friend to some extent. Any extension of the relief thereby granted would be difficult to refuse, and could only be given by a further Act of Parliament.

THINGS ONE WOULD LIKE TO KNOW.

(Contributed.)

Has the *Car* any official authority for stating in the issue of the 28th ulto. that the County Surveyors' Society, in dealing with the question of heavy traffic on roads, "quite realises that the vast industry of automobilism must receive no harmful check, and that it is to be paid rather than to the vehicular traffic that attention needs be paid"? If this statement is authoritative, shall we not all be glad that this society has taken such a broad and proper view of the subject?

* * * *

Is it not rather depressing to see so many strong able-bodied chauffeurs of private motor cars in this country, when we know so much they are needed in the Government's ordinary purposes of order to assist this country in defending us against our vindictive enemy? Is it the fault of the men themselves or of their employers? And what can be done to [illegible] to the fact that this is a war on which our very existence depends? Was not that early cry of "Business as Usual" rather detrimental to our patriotism? Has it not already been proved to have been very premature and unnecessary?

* * * *

Was not the recent collapse of a reinforced concrete building at Bury, in Lancashire, a sad blow at this form of construction, and a possible example which can be used by those who have hitherto looked with some disfavour on this "innovation," as it is even now called by them? Is it not to be hoped and expected that careful investigations will show that there were some special causes for this failure, which might have arisen even in quite another form of construction, so that the employment of reinforced concrete in this case cannot be condemned?

* * * *

Is it a fact that wearing a man before murdering him does not constitute murder? Are the murderers of the innocent [illegible] on board the "Lusitania" to be absolved from their fiendish crime because they said they were going to do it? Does not premeditation add greatly to the abomination of the offence? When will England rouse itself and punish the [illegible] who can be capable of inventing and carrying out the awful crimes which it is committing?

* * * *

Is it a compliment to surveyors or not that the "nuts" of society should be now introducing the subject of roads into their conversation? Do we not find that when they are bored with the turn that talk may be taking they suddenly say, "Yes, that's all very well, but what is your opinion of the state of the roads in Patagonia?"

* * * *

Why is it that the council of the Institution of Municipal and County Engineers, after definitely declining to take part in the road conference which is to be held in June under the auspices of the County Councils Association, have now issued a circular, signed by their secretary, inviting members of the institution to take part in this conference? Why should not the council have agreed to this course at first? And what change has occurred to make them now alter the decision at which they had previously arrived?

* * * *

Has not the Royal Automobile Club shown us, by its eminently practical actions during the war, that a club can be not only a source of social intercourse, but a most useful and powerful adjunct to the resources of a nation? Does not the recent annual report prove that a club can, in time of urgency, act promptly and usefully? And should not this be an example to other clubs that have done nothing, so far, to justify their existence in time of war?

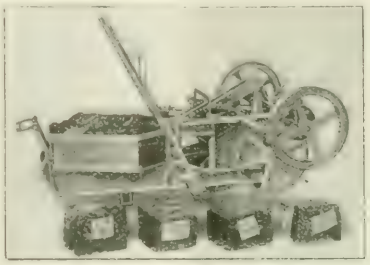
* * * *

Now that it is an established fact that the *Pediculus vestimenti*, or louse, which harbours itself in flannel shirts of dirty people, is the chief cause of typhus fever, will not the following story from the trenches be of interest? One Tommy said to another, both being Cockneys, "Bill, have you got any lices about you?" "No," said Bill, "I had a bath yesterday and a clean shirt." "You silly," said the inquirer, "I didn't mean louse lices, but boot lices!" Does not the charm of this story rest in the fact that it is probably true?

THE "CAMCO" SHEET METAL SCRAP PACKING PRESS.

The accumulation of scrap metal, and particularly old tin cans, sorted out from household and other refuse, is a problem that has long confronted the municipal engineer, but there are many towns throughout the country the authorities of which have yet to realise that this "waste" is one that, for a very moderate outlay, can be turned to very profitable account.

Loose or in bulk, the material referred to is a drug on the market, but suitably bushelled or baled, ready for the smelter, and in a form and density that practice has proved to be most suitable for reduction, it immediately becomes valuable. An efficient means of doing this would seem to be provided by the "Camco" sheet metal scrap packing press, which has been brought to our notice by the Canadian-American Machinery Company, Limited, 8 Bouverie-street, Fleet-street, London, E.C., and the operation



of which is so simple a matter that it requires the attention of only one person, and—what is more important—but little driving power.

The accompanying illustration is a fair representation of the machine when the top is closed down, as is the case when in the act of pressing, or rather bushelling or blocking, which is its work, and not merely baling. As to how well it does its work can be seen by the reader looking at the bushels or blocks as shown in the foreground of the illustration. There is shown its work in the various kinds of scrap which the machine is built to handle, each block being labelled as to what kind of scrap it contains. One is scrap shearing from stove pipe works, one scrap from punchings in making curry combs, one the various ordinary die and punch scrap, and one of old fruit and vegetable tin cans of various sizes. The "Camco" will pack lathe cuttings and metal working machinery chips and cuttings.

As seen by the illustration, the packer is self-contained, so that it can easily be placed anywhere, calling for a floor space of some 5 by 8 ft. only. It is provided with tight and loose pulley, so as to be run from the line shaft such as is usually used in scrap-iron yards, or in mill scrap-iron sheds, to furnish power to run scrap shears, or to be run from a line shaft in the plant where used. It is also equipped with friction clutches, which place it under full control of the operator, who can instantly start and stop it at will, independent of the source of power.

Coast Sand Dunes (By Gerald O. Case, St. Bride's Press, Limited, 24 Bride-lane, E.C., price 5s.).—Mr. Case has done a valuable work in the writing of this book.—*Southport Guardian.*

Southend Town Planning. It is understood that the Local Government Board have given authority to the Corporation of Southend-on-Sea to prepare a town planning scheme under the Housing, Town Planning, &c., Act, 1909, in respect of an area of about 62 acres forming part of the Chalkwell estate within the county borough.

The Greater Swansea Scheme.—The Swansea Corporation have received the draft order consenting to the Greater Swansea scheme. The borough will now be one of the largest in the country, being increased by four times its size to a total of over 24,000 acres. Among the districts added is Mumbles. The population is increased by 33,000 to a total of 153,000, and the rateable value now approaches £750,000.

Institution of Municipal and County Engineers.

MEETING AT SCARBOROUGH.

Last Saturday's meeting of the Institution of Municipal and County Engineers was one full of interest to those who took part in it. In addition to the very considerable number of improvement works which the borough engineer, Mr. H. W. Smith, was able to show, the visitors were afforded the opportunity of viewing some of the damage wrought by the German battleships on the occasion of their flying visit to the famous health resort in December last. At 10 o'clock the members assembled in the town hall, where they were accorded a hearty welcome by the mayor, Mr. C. C. Graham. A bare half an hour was devoted to business, and the remainder of the time before lunch was occupied by an examination of improvements at the spa, beach bungalows, gardens on the South Cliff, and a bathing pool which is in course of construction —all these works being situated in the South Bay. In the afternoon the Castle Hill, which, it will be remembered, received special attention at the hands of the German gunners, was visited. The Alexandra Gardens and Peasholm Park were afterwards seen, the beach bungalows and bathing establishment in the North Bay being subsequently inspected. On their return to the town hall the members were entertained to tea by the mayor. At the opening proceedings in the morning the chair was occupied by Mr. J. S. Pickering, the president, and the company included Messrs. A. Beaumont (Yorks, E.R.), F. C. Beaumont (Driffield), J. H. Drew (Wath-upon-Dearne), S. Dyer (Bridlington Rural), H. B. Foster (Leeds), W. Fowlds (Keighley), C. F. Hodgson (Otley), J. H. Iveson (Scarborough Rural), J. D. Kennedy (Retford), F. O. Kirby (Doncaster), C. Lund (Cleckheaton), S. M. Mason (Grimsby), F. Massie (Wakefield), W. Millhouse (Scarborough), E. Picker (Beverley), H. Richardson (Scarborough), Leslie Roseveare (South Shields), A. J. Rousell (Whitby), J. A. Settle (Bury), J. E. Silcock (Westminster), H. W. Smith (Scarborough), F. W. Spier (York), W. J. Steel (Newcastle-on-Tyne, district chairman), J. P. Wakeford (Wakefield, hon. district secretary), W. J. Warburton (Hornsea), R. E. Webster (Loftus), B. J. Wormleighton (Loftus). The visitors attending the meeting were the mayor (Mr. C. C. Graham), Alderman Pirie, Councillor White, Councillor Boyce, Alderman G. Thornton and Mr. G. H. Miers.

In welcoming the members the MAYOR (Mr. C. C. Graham) said he hoped the day, besides being an interesting one to them from a professional point of view, would also not be without some element, at all events, of pleasure. It would not be easy to overrate the duties and the responsibilities that were attached to their profession. They were directly and immediately responsible for those very necessary arrangements in the towns which the average individual took for granted, but which so very largely affected the general health and welfare. They were responsible for planning and carrying out new urban areas, and the arrangement of those which had become old, inconvenient or obsolete. Beyond that they were responsible for the proper condition of the roads and streets of the town and country districts, while they were also closely connected with the matters of sanitation and lighting. Another matter which concerned them was the provision of open spaces, and it was to the latter aspect of their work that their attention was to be particularly drawn in the paper that was to be presented by their esteemed and capable borough engineer, Mr. Smith. Scarborough owed its popularity as a health resort mainly to the natural beauties both of the town and the surrounding district. They would get some idea that day of the efforts that had been made to beautify the cliffs and make them more permanent. Scarborough, they would find, had extensive and very beautiful gardens along the coast. But, while Nature had done so much to render Scarborough beautiful, the forces of Nature, erosion and denudation, were constantly going on, and presented great difficulties which had to be overcome. He hoped they would approve of the way in which these difficulties were being overcome. He was sure they would, at all events, find great interest in the work that was proceeding.

Acknowledging the welcome, the PRESIDENT (Mr. J. S. Pickering) said that they knew from past experience that they would receive a very hearty reception in Scarborough, and the kindly words to which his Worship had given expression only bore out their anticipations. That was the third occasion on which the institution had met there. The first meeting took place in 1892, when Mr. Joseph Petch was the borough engineer, and the second was held some nine years ago, when they were received by their esteemed confrère the present borough engineer. The comparatively small attendance that day was not due to any want of appreciation of the invitation that had been extended to their members; he need hardly say the reason was the great crisis through which the country was passing. Many of their members were serving their country, and others had their office staffs so depleted that it was impossible for them to attend. None, he was sure, had absented themselves owing to the fear of a repetition of the diabolical act of last December. They all felt that seaside towns ought not to be made to suffer through people absenting themselves from them at the present time, and he thought they could best show their sympathy with Scarborough in the great calamity which had overtaken the town by taking the first opportunity of participating in the great advantages and benefits to be derived from the Queen of Watering Places. The Mayor had hoped that their round of visits would prove highly instructive and interesting. Some few years ago they had the pleasure of inspecting the new Marine-drive, and they were glad to be able to congratulate Scarborough on the successful completion of that undertaking. They were also pleased to know that the great engineering difficulties had been overcome, mainly by the skill and ability of their borough engineer. He thought as a town they should be proud of possessing one of the finest promenades and drives to be seen in any part of the kingdom. They were also looking forward to their visits to the many attractions made for the benefit of visitors. The descriptive paper prepared by Mr. Smith was in itself sufficient evidence of the progressive policy of the council. Scarborough could boast of possessing amenities unrivalled by any other health resort in the kingdom. As municipal engineers engaged in work both utilitarian and ornamental, these visits were to them of great service, and he believed they also conferred a benefit on the towns they represented.

Following the announcement of the receipt of apologies for non-attendance from Messrs. W. T. Lancashire (Leeds), W. Welburn (Middleton) and J. W. Dudley Robinson (the secretary), the subjoined paper was presented to the meeting:—

CATERING FOR THE WANTS OF THE HOLIDAY MAKER.

By HARRY W. SMITH, ASSOC.M.INST.C.E.,
Borough Engineer, Scarborough.

[Mr. Smith, after serving his articles with a Bournemouth architect, entered the office of the borough surveyor of that town under the late Mr. G. R. Andrews. Subsequently he acted as assistant in the same office under Mr. F. W. Lacey, M.INST.C.E., and was appointed to his present position in 1897.]

If any apology is needed for the title of this paper as being of interest to only a small section of the members of our institution, the author must plead in justification that the subject forms a very important branch of the work of those of us whose lot is cast in the pleasure resorts of this country, and it is his intention, within the limits of this paper, to give a brief description of some of the works coming under this heading which have been carried out in Scarborough since the last meeting of the institution in 1906.

The ancient history of the borough has already been given in a previous paper, and the author does not propose to repeat it, but will merely quote current statistics.

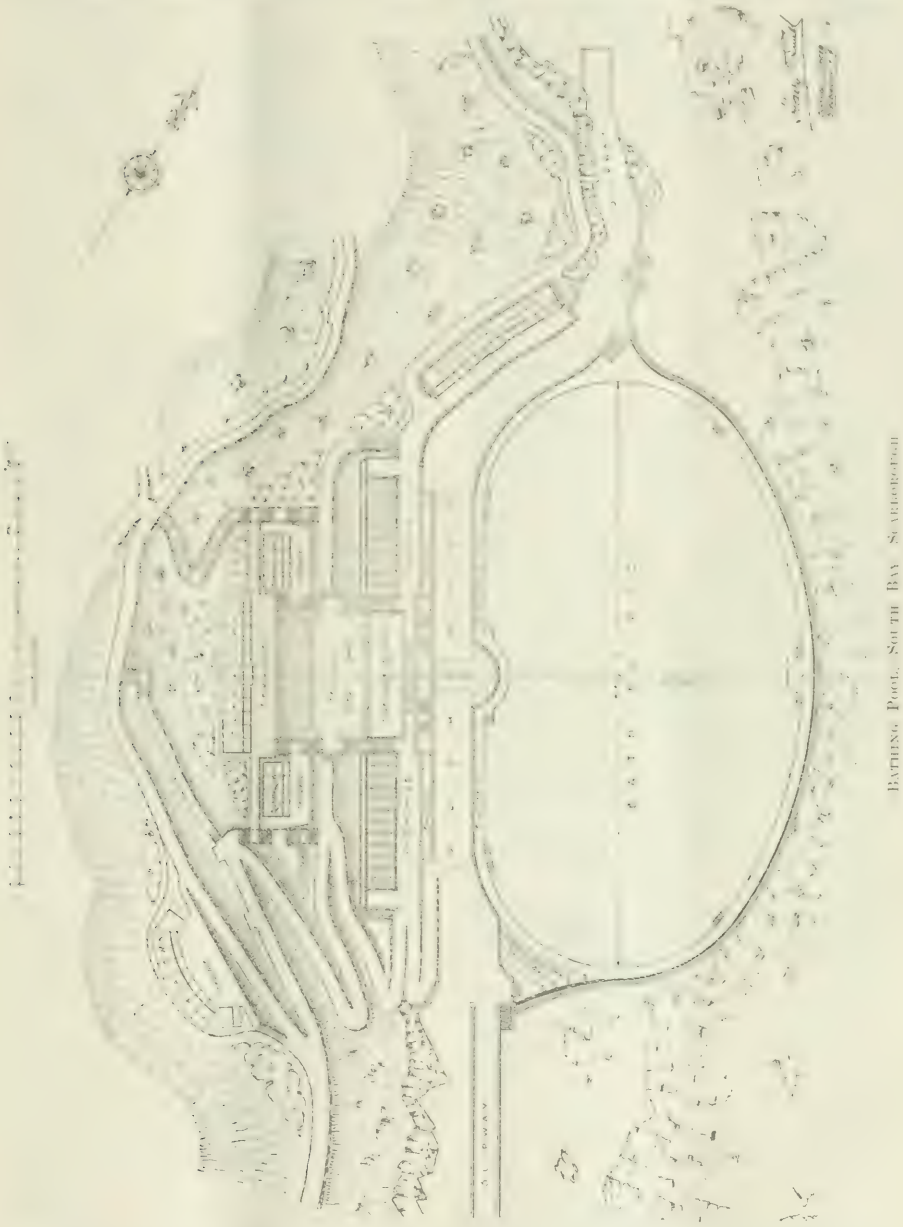
The area of the borough is 2,902a. 1r. 13p., its population at the last census was 37,201, it is now estimated at 37,889, and its rateable value is £245,626.

It is a moot point as to how far a municipality is justified in entering into competition with private enterprse in catering for the needs of the holiday maker; in many branches, unless expert advice is sought and retained, financial loss is pretty certain; but, on the other hand, there is much to be said for a municipality being in a position to safeguard and control certain sections of its amusements; there is,

moreover, the added advantage that when financial [illegible] set and maintained.

The policy adopted in Scarborough with respect to amusements, &c., provided in the parks and pleasure grounds is to provide the necessary buildings, fittings and furniture for all musical and theatrical entertainments, leasing them to experienced caterers, with protective clauses safeguarding the character and nature of the performances given; but as to games, of amusements, the town is rapidly recovering lost ground, and the results have been so encouraging as to spur her on to fresh endeavours, and the author confidently hopes that when next the institution [illegible] much, if not more, to show them in the way of holiday attractions than has been accomplished during the past eight years.

To the great majority of visitors to our coast towns the sea is the premier attraction, and it is a sound



BATHING POOL, SOUTH BAY, SCARBOROUGH.

to retain and run them municipally. This policy experience has proved to be entirely satisfactory.

Results in Scarborough have shown that a progressive policy in respect of the provision of entertainment and amusement for the holiday maker is amply justified. Scarborough, as a pleasure resort, has, in common with many of the older seaside towns, suffered in the change in habits of the people and the competition of foreign travel. To-day, however, due to the enterprise of the town council in the provision policy to centre the holiday amusements as near the sea front as possible. This points to the wisdom of the municipality of a seaside town acquiring land wherever possible along its frontage. Out of a total sea frontage of 4½ miles, Scarborough either owns or leases some 3¼ miles, and it is mainly upon the land so acquired that Scarborough's latest parks and pleasure grounds and places of amusement have been laid out and constructed, and of which it is the intention of the author to give a brief description.

The area of the land in the borough devoted to parks and pleasure grounds is 186 acres, of which 55 acres have been added since the last visit of the institution. The cost of upkeep, interest and repayment of loans for purchase and development entails a charge upon the rates of 7·2d. in the £ annually. Although none of the pleasure grounds are of a very extensive area, they are extremely varied in character, and those situated on the undercliff here furnished many interesting engineering problems.

To proceed with a description of the recent additions.

ALEXANDRA GARDENS

These gardens, which are situated on the cliff top in the North Bay, are 4¾ acres in extent, and were laid out in 1909, the land having been purchased some years previously. The site was so exposed and windswept that it was impossible for trees, shrubs, or flowers to live, and to overcome this difficulty, embankments of earth have been thrown up to deflect the wind. This has enabled a complete transformation to be effected, and these gardens now vie in floral display with any other in the town.

It was originally intended to devote the whole of the level portion of the gardens to the games of bowls and tennis, but on their completion they appeared to be so well adapted for the holding of entertainments that one of the tennis lawns was given up for the purpose, an area of a little under an acre in extent.

For two years open-air entertainments by a concert party and bands were carried out in these grounds, with varying success, the takings fluctuating with the weather.

Various temporary devices were tried in the way of sheltering the audiences, none of which were satisfactory, and in 1909 the author laid before the council a scheme for the erection of a glass pavilion to seat about 1,000 people, at an estimated cost of £3,000, one side of which was to be capable of being opened out, to admit of a portion of the audience being in the open-air in fine weather. This scheme was adopted by the council, but met with most strenuous opposition on the part of the ratepayers. The Local Government Board, after a lengthy inquiry, sanctioned the loan, and the building was erected in three months, and was opened in July, 1910. It has since proved to be one of the most remunerative undertakings the council have embarked upon, so much so that in 1912 a further addition was made to the building of 500 seats. It cannot be said that the housing of the audience partly inside and partly outside was altogether satisfactory in practice, the hall was nearly always closed, and this feature, since the addition, is now practically abandoned.

The council let the building by tender, furnished complete, to an entertainment caterer; they maintain the floral display, which is a feature of the building, but the tenant provides everything else.

There are two bowling greens in the gardens, one crown and the other flat, and three tennis courts, which are extremely popular and yield a good revenue. A pavilion for the use of bowlers and tennis players is provided.

Overlooking the bowling greens is a combined public shelter and cafe, the latter being let on lease. Lavatories for both sexes are also provided.

The total cost of laying out these gardens was as follows:

Floral hall, seats in arcaded roads, including toilet blocks	£14,900
Shelter and café	540
Bowlers' pavilion	160
Laying out grounds	4,000
	£19,700
Cost of upkeep, loan charges, including purchase of land, in the year 1913 was	£1,206
Which the receipts from entertainments and rents were	£1,110

PEASHOLM PARK.

Peasholm Park, which adjoins Alexandra Gardens, was laid out in the winter of 1911-12, partly on land which was originally purchased for allotments and partly on land purchased from H.M. Commissioners of Woods and Forests. The site has historic associations, it forming part of the ancient Manor of Northstead. During the course of laying out the foundations of the old manor house were bared, and proved to be of a very extensive character. Unfortunately, they could not all be preserved, but careful records were taken of everything found.

The land, as purchased, consisted of a swampy meadow with a small stream running through it, surrounded on three sides by high grounds. At the sea end of this meadow was a large mound rising some 43 ft. from the level of the same. The situation suggested the formation of a lake, with the mound as an island, and by cutting away one side of the mound, and damming up one end of the ground and excavating, an ornamental lake of 4½ acres in extent has been formed, which is the outstanding feature of the park. The island has been connected up with the mainland by an ornamental bridge of a span of 45 ft. Smaller islands have been formed to act as refuges for water fowl.

At the western end of the park the stream which feeds the lake runs through a very pretty ravine, a portion of which is included in the park. The stream at this point has been dammed up and a chain of smaller lakes formed, each connected by a waterfall.

The lake is furnished with a fleet of boats and Indian canoes, twenty in all, and, although so near to the sea, boating has proved to be extremely popular and remunerative.

The surroundings of the lake have been embellished with shrubberies, lawns and flower beds, while the lake itself is well stocked with coarse fish and furnished with ornamental waterfowl of various species. An aviary for British and foreign birds has been built, and is much appreciated.

The bridges, boat-house, shelter and landing stage, which are of wood, have been designed in the Japanese manner, and it is the intention of the author to add further features of this character. A large café, shelter and lavatories are now in the course of construction.

Peasholm Park may be said to be only in its infancy, for the council are at the present moment taking steps, under the Town Planning Act, and by purchase from H.M. Commissioners of Woods and Forests, to acquire the extensive ravine lying to the west.

The cost of laying out Peasholm Park, including bridges and buildings, &c., was	£8,025
The cost of upkeep and loan charges, including purchase of land, for the year 1913 was	817
The revenue from boating was	950

PEASHOLM UNDERCLIFF.

The Peasholm Undercliff, as its name implies, is a cliff side, situated in the North Bay, immediately adjoining the north end of the Royal Albert-drive, was purchased from H.M. Commissioners of Woods and Forests at the same time as the land for Peasholm Park, and is 4½ acres in extent.

Running along the foot of the cliff was the corporation main sewer outfall, which, to some extent, acted as a protection to it from the inroads of the sea, but the cliff itself was in a very bad state, due to the presence of numerous land springs.

Before any portion of the undercliff could be utilised for the erection of buildings, extensive drainage operations had to be carried out. The strata of the cliff consisted of shale, overlaid by boulder clay, with pockets of drift sand. The system of drainage employed consisted of deep main drains taken down into the shale, with spur drains to intercept subsoil water. The pipes used were glazed sanitary pipes, laid with open joints, and all trenches were filled up with rubble stone from the beach.

A promenade (for foot traffic only) has been formed, 25 ft. in width, for the whole length of the undercliff, 13·5 ft. above ordnance datum, the sea wall supporting the same also acting as a protection to the outfall sewer. This wall was built with concrete blocks, 2 ft. by 1 ft. by 1 ft., with a bull-nosed coping; it has a stepped face; the space behind the blocks and the sewer was filled in with mass concrete.

Immediately behind the promenade the cliff side [illegible] buildings in connection with the improvement are erected.

Perhaps the most popular feature of this scheme has been the provision of the beach bungalows, of which some forty-six have been erected. These are grouped in blocks and pairs, and each bungalow has a small portion of ground in front of it for its exclusive use; the paths immediately communicating [illegible] the bungalow-holders. No sleeping is allowed in the bungalows, and they are let on annual tenancies at [illegible] small number are retained by the council, which are let for short periods. The dimensions of the smaller

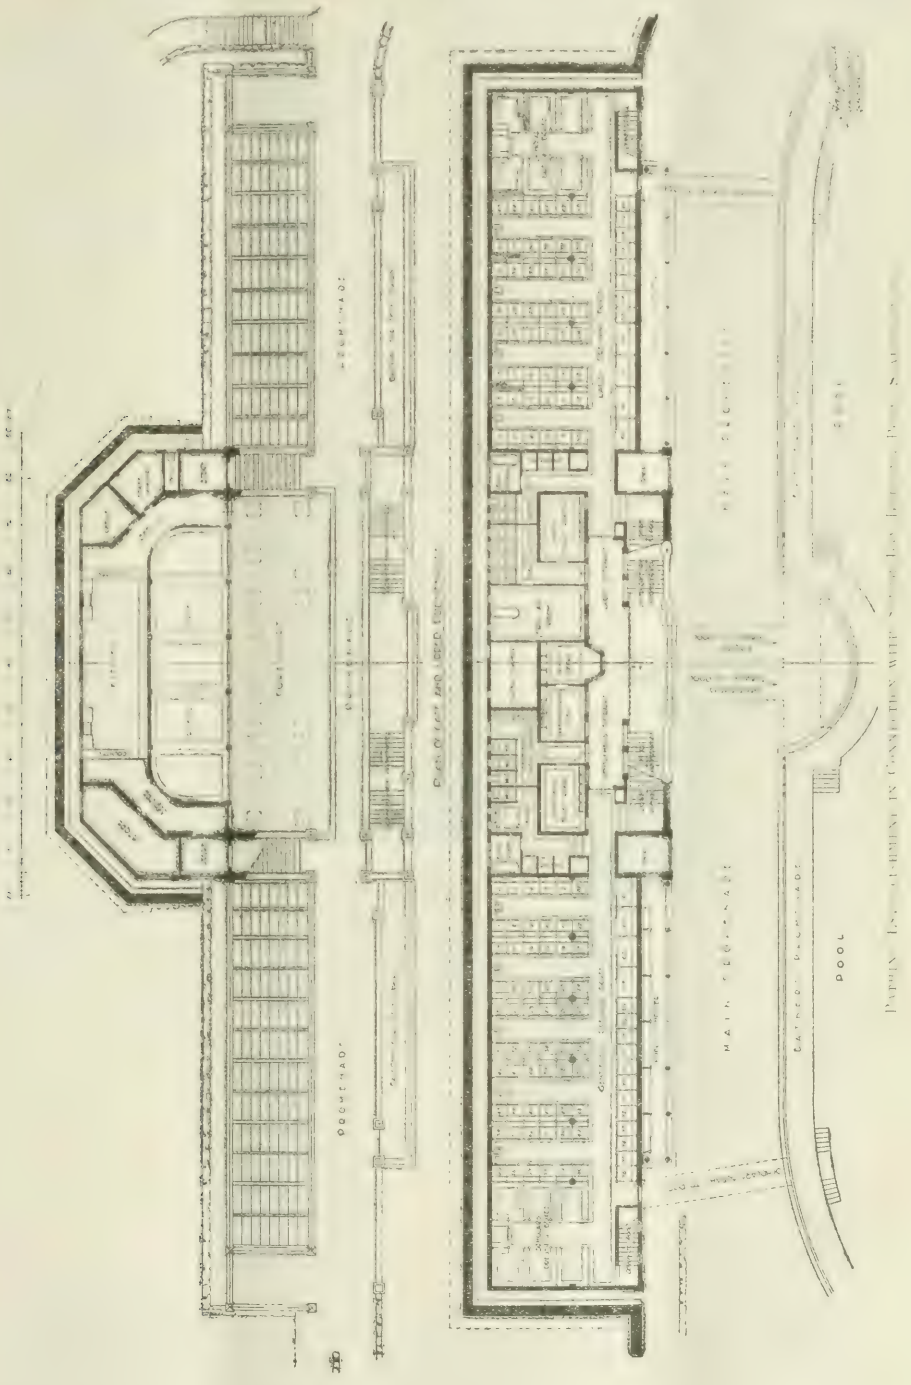
bungalows are 8 ft. by 7 ft. 6 in., with a covered verandah 8 ft. by 4 ft. The larger ones are 15 ft. 3 in. by 8 ft. The fittings consist of a corner cupboard and a folding table, gas is laid on, and water at convenient points. The demand for bungalows is steadily growing, and the council are taking steps to provide more.

The beach bathing establishment consists of twenty bathing-boxes for males and twenty for females, with cold shower baths and lavatory accommodation. This establishment has proved to be very popular for beach bathing, the only drawback being the distance to be traversed by the bather at low tide.

Three public shelters are provided, one being in connection with a café, which is leased to a caterer.

The whole of the buildings (with the exception of the lavatory block) in connection with this improvement are of wooden framing, lined on the outside with weather-boarding and inside with match-boarding; the roofs have been covered with Poilite slating.

The average cost of the smaller bungalows is £28, the larger ones £50, exclusive of preparation of site.



The author has prepared plans for a bathing pool and establishment on the beach, adjoining this undercliff, of similar character to the one now being constructed in South Bay, and but for the war would have shortly been commenced.

They are 18¾ acres in extent, and until their purchase in 1912 they formed a barrier between the whole of the frontage of the Esplanade on the South Cliff and the beach, to which access could only be obtained at one point by means of a steep flight of steps.

SOUTH CLIFF GARDENS.

The South Cliff Gardens are situated in the South Bay, and consist of the wooded undercliff lying between the Spa Grounds and the Holbeck Gardens.

A portion of the southern half of the undercliff purchased had been laid out as a private garden some years ago, and some drainage had been carried out; but large areas were in a very bad state, and heavy landslips had taken place, due to the presence of springs. Since the acquisition of the land very heavy sums have already been expended in drainage, the work having been done in sections, and a considerable further expenditure under this head will be required before the cliff can be brought to rest. Drainage work and excavating are now in progress, and members

The Surveyor
And Municipal and County Engineer.

[illegible] the application [illegible] garden in the making.

A complete scheme of development was prepared by the author for the whole of the land, dealing with the whole area, in which an expenditure of £50,000 or more was foreshadowed, and the work is being carried out in sections extending over a period of years.

A start was made with the northern half of the gardens in August, 1912, and this section is now practically completed.

The strata of the undercliff consists of sandstone rock at the beach level, overlaid by shale and boulder clay, and the general system of drainage adopted consisted of deep main drains of open-jointed stoneware pipes, with all trenches filled up to the surface with rubble, and spur drains taken to intercept the subsoil water, the whole discharging into a cast-iron outfall pipe laid across the beach.

A series of winding footpaths, connecting the esplanade with the sands, have been constructed, and it is now possible to reach the sands without a step. The height of the cliff at this point is about 175 ft., and the length of main footpath is over ½ mile. The heaviest gradient on this path is 1 in 13; the paths are tar-paved, the surface being sprinkled with broken red brick for effect. Short cuts, with concrete and rustic steps, are provided at convenient points.

The formation of these footpaths entailed considerable excavating, and it was necessary to construct retaining walls at the back of most of them. These walls are formed of sandstone, quarried on the beach, and they have been [illegible] herbaceous.

Early in 1914 the [illegible] of the southern half of the gardens was commenced, mainly consisting of the linking up of the completed [illegible] half with the Holbeck Gardens, and the formation of the rose garden.

The rose garden is of segmental form, and the central feature is a stone-kerbed lily pond of geometrical design, surrounding a pedestal upon which is a graceful lead figure of "Mercury."

At either end of the gardens rises a series of terraces, with stone retaining walls and piers finished with vases; flights of steps lead up to pergola shelters of classic design, overlooking the garden.

The garden is sheltered on the sea side by a trellis of larch posts and rails, filled with riven oak lattice pales.

The gardens are furnished with teak seats of ornamental design, which, together with the statue of "Mercury," were a gift from a townsman.

BATHING POOL.

Sea bathing is an important item in the programme of the holiday maker, and the question of better and more up-to-date provision of facilities has been under the consideration of the Scarborough Town Council for some years past. As far back as 1900 they applied for and obtained Parliamentary power to construct bathing pools upon the sea shore, and to make a charge for the same, with borrowing power to the extent of £8,000, repayable in forty years.

Ancient prints of Scarborough show the "ark on wheels," with which we are all familiar, and which to-day holds sway on the sands. Its long vogue has no doubt been due to the fact of its capacity to follow the receding tide, and saving the bather a long walk over the sands, which of necessity occurs when any permanent structure is erected on the sea shore. This drawback, as before stated, is felt in connection with the present establishment in the North Bay.

The safety of the bather is of the utmost importance to a seaside resort, and in Scarborough at the present time three safety boats, with two men in each, are continually on duty daily during bathing hours.

The advantages of a bathing pool are manifold, and, briefly, may be summed up as follows:—

(*a*) A reduction of the risk of sea bathing to a minimum.

(*b*) Bathing is possible at times when, owing to rough seas, it would be risky to do so.

(*c*) More commodious accommodation and comfort can be provided for the bather than is possible in a bathing van.

(*d*) Facilities for the holding of swimming galas and carnivals, with the attendant revenue to be obtained therefrom.

Since 1900 the author has prepared a number of schemes for pools in various sites in the North and South Bays, but until the purchase of the South Cliff Gardens nothing came of them. The site now chosen —in a small bay on the foreshore near the southern end of the gardens—is an ideal one for the purpose.

The scheme prepared by the author provides for a pool extending along the shore 350 ft., and seawards 190 ft., varying in depth from about 2 ft. to 7 ft. It is oval in shape, the landward side being flat. A commencement was made with the work of constructing the pool during the summer of 1913, and it is rapidly nearing completion.

The foundation of the pool wall rests on the sandstone rock forming the sea bed. The outer wall is 9 ft. 6 in. thick at its base, and 6 ft. 6 in. on the top, finished on the inside with a bull-nosed coping and on the outside with a dwarf rounded coping 10 in. high to act as a kerb. The wall will serve as a bathers' promenade, and will be used to seat spectators during galas.

The range of tides varies between neaps and springs from 4·5 ft. to 10·5 ft. above ordnance datum, and the level of the top of the wall has been fixed at 7 ft. above ordnance datum, so that, with the exception of calm-water neap tides, fresh water will flow over into the pool at high water.

Five outlets, 15 in. in diameter, fitted with screw-down valves, are provided for emptying the pool.

Steps to enable bathers to enter and leave the water will be provided, and also platforms fitted with diving boards, &c.

The wall for a short distance from the shore was constructed of an outer skin of concrete blocks, 2 ft. by 1 ft. by 1 ft., header and stretcher courses, alternately filled in with concrete in mass. The seaward section is constructed of mass concrete in two courses. Wooden boxes, 10 ft. by 9 ft. by 3 ft. 6 in., and 10 ft. by 7 ft. 2 in. by 3 ft. 4 in., were employed, a box being filled each tide and left for two days before striking. Rock from the beach and old iron rails were used as a tie between the two courses. The outer face of the wall was 3 to 1, with a hearting of 6 to 1, and rock from the beach being used as plumbs. The coping and kerb to the wall is formed of blocks.

On the landward side of the pool, 17 ft. above ordnance datum, is a promenade for the public, 25 ft. in width, descending at either end to the beach by slipways and steps.

The establishment in connection with the pool is now in course of erection.

The accommodation provided consists of seventy-six boxes for males and sixty-one for females, with separate accommodation at either end for the use of schools. Hot water and cold showers, baths, first-aid room in case of accidents, ample lavatory accommodation for the bathers and the public, attendants' room, &c., are also provided for. Access to the pool is by means of steps, and four subways under the promenade.

On the top of a portion of the establishment will

be a cafe, with terraces, promenades, and seating accommodation for spectators, overlooking the pool, access to which will be gained by flights of steps from the main promenade.

A separate block for the purpose of a laundry and pumping plant for conveying the sewage from the establishment to the sewers on the Esplanade will be provided for.

Space for the buildings has been excavated out of the cliff side, retaining walls on each floor level will be necessary, and for these reinforced concrete will be employed.

The buildings will be of brick, with patent stone dressings. The flat roofs will be of reinforced concrete covered with asphalt. The walls of the lavatories, showers and corridors will be lined with glazed tiling.

On a third terrace, overlooking the pool, will be erected blocks of bungalows of a similar type to those already described.

A series of winding walks, connecting the pool with the existing main walks in the gardens and leading to the Esplanade, are now in the course of construction, and a low-level promenade, connecting up the bungalows in the northern half of the gardens, will shortly be put in hand.

As the works of the development of the South Cliff Gardens are not yet completed, exact costs cannot be given, and the following figures show the approximate or estimated cost of the works already carried out or of those now in hand:—

	£	s.	d.
Laying out northern section of the gardens—			
Beach shelter	820	3	8
Bungalows, lavatories, cafe and shelter.	3,813	0	0
Footpaths—excavating and draining ...	5,320	0	0
Extension of beach shelter	629	16	4
Laying out southern section of the gardens—			
Drainage, excavating and laying out of rose gardens, shelters, footpaths, &c.	3,412	0	0
Bathing pool and promenade, bathing establishment, laundry block, café and bungalows	13,200	0	0
Laying out of cliff adjacent to bathing establishment	4,500	0	0
Total expenditure on works completed, &c.	£31,695	0	0

(To be concluded.)

KILLED IN ACTION.

The Water Committee of the Birmingham Corporation received a report last week of the death in action of Private W. A. E. Owen, of the 1st Company of the 8th Battalion (T.F.) of the Royal Warwickshire Regiment. Prior to the war Private Owen was in the service of the water department at the Broad-street office, and the news of his death on Sunday, April 25th, was communicated to Mr. L. [illegible], the secretary of the water department, in a letter from Private F. J. Bent, who was also employed by the department.

Private William Kent, 9th Battalion Royal Scots, of the county sanitary inspector's office, Ayr, was killed in action in France on April 23rd.

City of London National Guard Engineers' Unit.—On Saturday afternoon, May 8th, the Post Office Engineering Volunteer Training Corps and the National Guard Engineers' Unit took part in a joint parade near Lancaster-gate, Hyde Park, afterwards marching to the Powder Magazine, Kensington Gardens. Arrived at this point, the Post Office Engineers, under their Commandant, Captain Gunton, commenced the installation of field telegraph and telephone systems between the Marble Arch and the Round Pond; while the National Guard Engineers, under the command of Mr. W. Noble Twelvetrees, Acting-Adjutant, made a survey for the construction of a trestle bridge to be erected for use by the Post Office Corps, and subsequently acted as an attacking party whose object was to pursue and capture one of the field telegraph companies operating in Hyde Park. The bridge mentioned is now in course of construction by the Engineers' Unit, at the headquarters of the London Brigade R.G.A., Offord-road, Barnsbury, where drills and engineering practice take place on Tuesday, Wednesday and Thursday evenings.

FUTURE DEVELOPMENTS IN HEATING AND VENTILATION.

On Tuesday, at a meeting of the Society of Engineers, Mr. A. H. Barker, M.I.Mech.E., B.A., B.Sc., read a paper on the above subject. The twin sciences of heating and ventilation, he said, have received but little attention in their scientific aspects. The complexity of the factors that go to make up a given result, and the difficulty of defining in terms of exact science what that result is or should be, are reasons for lack of progress in the science of the subject, and added to this one has to take into account the variability of human physiology and psychology as an essential part of the problem.

Physiologists are not even agreed upon what was a healthy temperature for human beings to live in. The heating and ventilating engineer aimed at producing comfort, but is baffled by the fact that a man is comfortable only when he thinks he is. Air which, judged by chemical analysis, is impure may feel fresh and sweet, and *vice versâ*.

The only legitimate function of the engineer is to produce and control specified movements of air and other effects, while it should be the duty of the physiologist and hygienist to specify what are healthy and comfortable conditions. In connection with heating, the expression "temperature of a room" is generally understood to mean the reading of a thermometer suspended in the room; but this reading does not necessarily indicate the temperature of the surrounding air, or form a reliable guide to the feelings of the occupants of the room. The air temperature, the radiant temperature, the quantity of convected heat, and the quantity of radiant heat must all be determined; but first the relation between the thermometer reading, the air temperature, and the radiant temperature must be determined.

The freshness of air in a building depends on keeping the air temperature relatively low, and the radiant temperature high. The chemical composition of the air has, within wide limits, no effect on the human organism; whereas its temperature and humidity are very important.

The paper described experiments made at University College, and the apparatus used in connection with them, and discussed briefly some problems which it is sought to solve experimentally.

CONCRETE INSTITUTE.

ANNUAL GENERAL MEETING.

The sixth annual general meeting of the Concrete Institute was held at Denison House, Westminster, S.W., on Thursday, the 6th inst.

Prof. Henry Adams, M.INST.C.E., the president, submitted the annual report and balance-sheet, which were adopted by the meeting.

It was announced that, as the result of the annual election of members of council, the following had been elected:—

Mr. R. H. Harry Stanger, ASSOC.M.INST.C.E., A.M.I.MECH.E., F.C.S.

Mr. D. B. Butler, ASSOC.M.INST.C.E., F.C.S.

Dr. J. S. Owens, B.A., M.D., ASSOC.M.INST.C.E., F.R.G.S., F.G.S.

Mr. W. G. Perkins, district surveyor for Holborn.

Mr. Ewart S. Andrews, B.SC.(LOND.).

Mr. J. Ernest Franck, A.R.I.B.A.

Mr. Lewis H. Rugg, ASSOC.M.INST.C.E.

Mr. G. C. Workman, M.S.E.

Mr. J. S. E. De Vesian, M.INST.C.E., M.I.MECH.E.

The president presented the institute's medal to Mr. W. Cyril Cocking (member), for the best paper read during the session 1913-14—namely, that entitled "Calculations and Details for Steel-frame Buildings from the Draughtsman's Standpoint."

The sixty-second ordinary general meeting then followed, when the adjourned discussion on Mr. Osborn C. Hill's paper, entitled "The London Building Acts with some Suggested Amendments," was resumed.

The last ordinary general meeting of the session will be held on Thursday, May 20th, at 7.30 p.m., at Denison House, Westminster, when Mr. E. A. W. Phillips, M.INST.C.E., M.C.I., will read a paper entitled "Lime Concrete in the East."

Assistants' and Students' Section.

CONDUCTED BY SYDNEY G. TURNER, ASSOC.M.INST.C.E.

All communications in regard to this page must be addressed to The Editor, St. Bride's House, 24 Bride Lane, Fleet-street, E.C. Envelopes must be marked "Assistants' Section" in the top left-hand corner. Correspondents are invited to submit questions for consideration and answers to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.

QUESTIONS.

[illegible] invited to the following [illegible]

479. Reservoir Dam. [illegible] and [illegible] of an earth embankment, with core [illegible] a reservoir by 12 ft. using [illegible] each side of [illegible] 2 ft. the embankment to be 12 ft. [illegible] the [illegible] (E. P. M., *Bangor*.)

480. Sewer Survey. [illegible] required to [illegible] of an old brick [illegible] 32 chains [illegible] 100 ft. on a [illegible] [illegible] [illegible] [illegible] How much [illegible] [illegible] what [illegible] [illegible] (W. S. W., *Guildford*.)

481. Testing Materials. [illegible] tests by which we [illegible] measure the [illegible] of [illegible] [illegible] [illegible] which [illegible] [illegible] property. (A. M. I. C. E.)

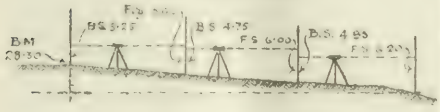
[The Editor is at all times glad to hear from readers who desire to submit questions regarding matters of general interest, points of daily practice, &c., for insertion in the "Assistants' and Students' Section." Questions which are published are taken into consideration, as well as other matter, in awarding the Monthly Premium.]

REPLIES TO QUESTIONS.

477. Levelling. In a series of levels, if the first back sight read 3·25 on an ordinance bench mark of 28·30, the sum of the back sights be 12·95, and the fore sights 17·20, what will be the ordnance reading of the last fore sight? (E. W. P., *Southampton*.)

Assuming the readings to suit the stated conditions, the elevation of the point upon which the last back sight was taken = 24·05 as shown in the accompanying sketch. If the last reading were

Field Conditions.



Booking.

B.S.	Int.	F.S.	Rise.	Fall.	Height above base.	
28·30		28·30			28·30	O.B.M.
3·25		5·00		1·75	26·55	
4·75		6·00		1·25	25·30	
4·25		6·20		1·25	24·05	
12·25		17·20		4·25		
		12·25				
		5·00				

taken on an O.B.M., and does not coincide with the above, the B.M. may have sunk through subsidence, or may have been marked wrongly. I came across one such in the Tyneside district, which read exactly 1 ft. below what it was marked. (F. N., *Gosport*.)

The difference between the sums of the back and fore sights gives the total rise or fall, according as [illegible] of the back sights is greater or less than the sum of the fore sights respectively. The rise or fall, added to or deducted from the ordnance reading of the first back sight, as the case may be, will give the ordnance reading of the last fore sight. In this case the sum of the fore sights exceeds that of the back sights, showing that the total fall exceeds the total rise of the ground levelled. Deducting the [illegible] or 17·20 − 12·95 = 4·25. Therefore it will be seen that the ordnance reading [illegible] = 28·30 − 4·25 = 24·05 (S. P. B., *Leeds*.)

478. Levelling.—It is required to find the difference of level of two pegs on opposite banks of a river, and it is known that the collimation line of the level you have to use is out of adjustment. How would you find the difference of level required? (E. W. P., *Southampton*.)

The line of collimation must be at right angles to the vertical axis of rotation, and therefore parallel to the [illegible] Should [illegible] not be the case the instrument can be tested for this deficiency and adjusted as follows: Select a level piece of [illegible] and drive two pegs [illegible] apart on either side of the level. Having carefully set up the instrument, place a levelling staff on one of the pickets (taking the lower peg first) and read the staff. Turn the telescope through 180 deg., relevel it and read the staff, which should now be placed on the other peg. Drive this peg down until the staff when placed on it gives the same reading as when placed on the first peg. When this has been done set up the instrument about half a chain beyond either peg, level it, and read the staff when placed on each peg. If the instrument is in adjustment then the readings on each peg should be the same, the distances being so short that the error due to refraction is negligible. If the readings on [illegible] the diaphragm screws should be carefully adjusted [illegible] the instrument without making the necessary adjustment, then the correction which it will be necessary to make to the readings on the staff can be determined thus: The routine described above is carried out as before, but the distance between the two pegs must be carefully measured. The instrument having been carefully set up about half a chain beyond either peg, as before, readings are taken on staff when placed over the two pickets and the difference of the readings noted. If i be the angle which the line of collimation makes with the hori[illegible] plane, then

$$\tan i = \frac{\text{Difference of readings on staff}}{\text{Distance apart of pegs}}$$

This determines the angle i. If the reading of the further peg be greater than that of the nearer, then the angle i is an angle of elevation; if the reading of the nearer peg be greater than the reading of the one more remote, then i is an angle of depression. The correction [illegible] to be applied to each reading of the instrument is—

$$D \tan i$$

where i is the angle of elevation when the correction must be subtracted from the reading on the staff; or is the angle of depression, when the correction must be added to the staff reading. D is the distance in feet from the instrument to the station whose level is required.

When determining therefore the difference in level between two pegs with an instrument whose line of collimation requires adjustment of this nature, the method of procedure is to take the levels in the ordinary manner, and also to measure the distance of the instrument from the staff when each reading is taken, applying the necessary correction, taking care to notice whether the latter is positive or negative. (M. T. R.)

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of Surveyor readers with a view to making the information given under this head as complete and accurate as possible.

INQUIRIES HELD.

St. Albans R.D.C. (May 5th. Mr. A. W. Brightmore).—£4,531 for works of sewerage and sewage disposal for the parish of Wheathampstead.—Mr. H. Howard Humphreys, M.Inst.C.E., Westminster, said he was called in by the council to advise on the remodelling of the existing works, and found that the present means of purifying the sewage were quite inadequate, and that in order to bring the works into line with modern requirements it would be necessary to provide practically entirely new plant. There was no public water supply, and the flow of sewage proper was low, but there was a great deal of roof and road water finding its way into the sewers during flood time. A good deal of storm water had been cut off during the last few years, but in all circumstances it seemed unlikely that very much more could be eliminated from the sewers. In these circumstances the new scheme had been designed to treat fully three volumes of sewage calculated at the rate of 15 gallons per head per day, from a population of 3,000 persons. In designing the filters it had been assumed that each square yard would purify 25 gallons for each foot in depth. Upon this assumption the two primary beds and one secondary bed were capable of fully purifying 135,000 gallons per diem—three times the dry-weather flow. The concrete bases of the primary and secondary beds were to be put in of larger diameter than was immediately necessary, so that in the event of an extension being required 22 per cent more square yards could be added for practically the cost of the additional clinker. The existing main sewer would be picked up at the manhole by the entrance gate, and would then join a new sewer from New Marford, and would discharge into a pump well under a new engine-house. Adjoining the pump well a storage tank would be placed, which would come into use only when the pump well was full. It was not intended to make general use of this tank, it having been provided in order to give time to get the pumps working should a sudden storm occur in the absence of the attendant. Further storm water storage would be provided in the two existing sedimentation tanks, which would be altered by the removal of the central division and the putting in of a new floor. Provision had been made for emptying the sewage from the storage tanks back to the pump well when necessary. The surveyor to the council, Mr. H. F. Mence, also gave evidence.

APPLICATIONS FOR LOANS.

Bournemouth T.C.—£3,550 for new roads and pleasure grounds.

Cannock U.D.C.—£386 for works of sewerage.

Lancs C.C.—£11,500 for a small pox hospital at Chadderton.

Loughborough T.C.—£930 for works of road improvement.

Pontefract T.C.—£1,045 for the purpose of street improvement.

Scarborough T.C. £700 for works on the South shore.

LOANS SANCTIONED.

Dundee T.C.—£29,000, supplemental loan for the electricity undertaking.

Exeter T.C.—£6,901 for the improvement of Paul-street.

Gower R.D.C.—£420 for work of road diversion.

Newcastle-on-Tyne T.C.—£1,801 for the provision of workmen's dwellings in the St. Lawrence and Walker-road districts.

Sheffield T.C.—£134,373 for an electricity sub-station and plant at Neepsend power station.

FORTHCOMING INQUIRIES.

COST OF MAIN ROADS.

EXPENDITURE FROM 1903—13.

On the 6th inst., in the House of Commons, Sir John Spear asked the President of the Local Government Board if he would state what was the amount of money expended by local authorities in England and Wales in the maintenance of main roads during each of the last ten years, and what portion of such money was raised from the rates, Imperial taxes, and the Road Board respectively.

Mr. Herbert Samuel: The latest year for which complete figures are available is the year ended March 31, 1913. The following table shows, for the ten years ended on that date, the amounts expended on the maintenance, repair, improvement, and enlargement of main roads (exclusive of expenditure out of loans) by county councils, who are the local authorities liable:—

Financial year.	Expenditure on maintenance, repair, improvement & enlargement of main roads.	Loan charges.	Total.
	£	£	£
1903-4	2,406,754	7,759*	2,414,513
1904-5 ...	2,478,481	8,766*	2,487,247
1905-6 ...	2,529,106	8,906*	2,538,012
1906-7	2,535,399	10,394*	2,545,793
1907-8	2,614,025	10,367	2,624,392
1908-9 ...	2,753,891	16,146	2,755,737
1909-10	2,835,822	16,966	2,852,788
1910-11	3,046,337	22,233	3,068,560
1911-12	3,323,458	33,081	3,356,539
1912-13	3,619,751	38,811	3,658,562

* Loan charges for main roads and other highways, but mostly for main roads

No portion of the proceeds of the local taxation licences, of the grant under the Agricultural Rates Act, 1896, or of the other Exchequer grants is specifically allocated to main road expenditure; but the published local taxation returns for the last few years give estimates of the amounts of that expenditure calculated to have fallen on grants and rates respectively, these estimates being based on the assumption that the benefit of unallocated Exchequer grants is spread evenly over all the branches of expenditure concerned. In regard to the year 1912-13, it was accordingly calculated that, of the abovementioned sum of £3,658,000, £2,298,000 was defrayed out of rates and £748,000 out of grants other than grants from the Road Board. The county councils received in the years 1910-11, 1911-12, and 1912-13 £8,000, £178,000 and £266,000 respectively from the Road Board, but these sums were not entirely limited to grants in respect of main roads.

Bradford Replanning: Competition Awards.—The Bradford Corporation some time ago invited competitive designs for the replanning of the centre of the city, in connection with the new Midland Railway line scheme, and the assessor, Mr. Reginald A. Bloomfield, R.A., on Wednesday gave his award as follows: First prize of £500, Gibson, Skipworth, and Gordon, Old Bond-street, London; second prize of £300, Patrick Abercrombie and Lloyd B. Barnes, School of Architecture, Liverpool; and third prize of £200, Reginald Dann, Crawley, Sussex, and John H. Horniman, Robertson-street, Hastings.

Tees Valley Water Board.—At a recent meeting of the Tees Valley Water Board it was decided to defer until after the war the construction of Conduit No. 10, the estimated cost of which is £47,000. The clerk reported that the Local Government Board had refused to sanction the borrowing of £3,000 for the extension of water mains. The board were on the horns of a dilemma, for if they did not carry out the extension they were under a statutory penalty. Several members said the action of the Local Government Board threatened seriously to cripple business, stop the building trade, and prevent the opening out of new districts, but no action was taken in the matter.

Municipal Work in Progress and Projected.

The Editor invites the co-operation of SURVEYOR *readers with a view to making information given under this head as complete and accurate as possible.*

The following are details of the more important projected works and which particulars appear in the Buildings—Durham, Northumberland, Southampton, Walton, housing and town planning Cardiff, Newcastle-on-Tyne; roads and materials—Durham, Herts, Seaford, Wandsworth; sewerage and sewage disposal—Swinton, Water supply—Aberdeen. Particulars of other projected works will be found on our "Local Government Board Inquiries" page.

BUILDINGS.

Altrincham U.D.C.—The question of providing [illegible] receiving attention.

Dewsbury T.C.—The plans for alterations and additions to the hospital at Thornhill have received the sanction of the Local Government Board.

Donegal C.C.—The county surveyor, Mr. J. H. Steadman, has prepared plans for alterations to the county offices at Lifford.

Durham C.C.—It has been agreed to reconstruct [illegible] mated cost of £3,000.—The Education Committee recommend the council to build a new school at Haggerleases, at an estimated cost of £1,095.

Leek T.C.—The Hospital Committee are giving consideration to a scheme for the provision of a hospital.

Llanfyllin R.D.C.—The council have resolved to approach Lord Powis with a view to obtaining the necessary land for the erection of a [illegible] Four Ends, Llangedwyn.

Northumberland C.C.—Plans have been prepared for a school at Ashington, which is estimated to cost £13,800. It is also proposed to build a school at Bedlington, at an estimated cost of £2,450.

Nottingham T.C.—The council are making application to the Local Government Board for a loan of £420 to provide an open-air annexe, accommodating 40 [illegible] for fitting up a dispensary in North Church-street for the treatment of tuberculosis, and carrying out certain works at the Bagthorpe isolation hospital.

Pontefract T.C.—A site has been purchased for the erection of public conveniences and lavatories.

Southampton T.C.—The council have approved the scheme of the waterworks engineer for the erection of a water tower on the Common, at an estimated cost of £14,000.

Surrey C.C.—The widening to 41 ft. of Windows Bridge on the main Portsmouth road has now been completed and the bridge opened to traffic. The contractors were Messrs. Stephen Kavanagh & Co., of Surbiton Hill, and the cost £2,393.

Uckfield R.D.C.—The council have referred to the Isolation Hospital Committee a communication from the East Sussex County Council intimating that it was proposed to make an order constituting a hospital district at Uckfield.

Walsall T.C.—A scheme is being considered for the purchase of a site at Great Barr for the erection, jointly with the West Bromwich Corporation, of a sanatorium, at an estimated cost of £20,000.

West Sussex C.C.—With respect to the proposed reconstruction of Norfolk Bridge, at an estimated cost of £17,000, a communication has been received from the War Office declining to contribute towards the cost, their view being that the liability for the work fell on the county.

HOUSING AND TOWN PLANNING.

Brixham U.D.C.—Negotiations have been completed for the purchase of land for a housing scheme.

Clydebank T.C.—The plans of a number of workmen's dwellings, which it is proposed to erect on a site of 12 acres, have been approved, and the master of works has received instructions to obtain tenders.

Droitwich R.D.C.—The Local Government Board, in response to an application for permission to purchase at once land at Ombersley, Cutnall Green and Snead's Green (although the housing projects for which the land was needed have been postponed until after the war), suggested that an effort should be made to extend the time of option of purchase, and that the schemes should be proceeded with and submitted to the board, so that there would be no avoidable delay in proceeding with the building of the houses as soon as circumstances permitted. The clerk said he thought there would be little difficulty in obtaining a short extension of the option period. The Housing Committee were instructed to proceed with the details of the schemes immediately, the clerk expressing the opinion that if that course were taken he thought the Local Government Board would allow the purchase of the land out of current rates, repayable [illegible]

East Barnet U.D.C.—The council have under consideration schemes, plans, and estimates for the erection of dwellings for the working classes.

Great Ouseburn R.D.C.—The Local Government Board have given their approval to the housing scheme for Boroughbridge, but the work is postponed for the present.

Newcastle-on-Tyne T.C.—A decision was reached last week to develop part of the Walker estate, belonging to the corporation, by providing 688 dwellings, at a capital cost of £117,781.

Swaffham U.D.C.—It has been agreed to submit to the Local Government Board an amended scheme for the erection of six houses.

Westhampnett R.D.C.—The Sanitary Committee have appointed a sub-committee to inspect sites at Eastergate for the erection of workmen's dwellings.

REFUSE COLLECTION AND DISPOSAL.

Horbury U.D.C. The [illegible] the [illegible] the [illegible]

ROADS AND MATERIALS.

Argyllshire C.C.—The surveyor to the Cowal District Committee has received instructions to prepare plans and estimates of several proposed road improvements for presentation to the Road Board.

Bristol T.C.—The city engineer, Mr. L. S. McKenzie, reported last week to the Sanitary Committee that the Local Government Board were now rather in favour of the widening of the road from Shirehampton to Avonmouth, and had asked that the application for the loan should be resubmitted.

Brixham U.D.C.—Tar-spraying is to be carried out [illegible] £1,30.

Bulkington U.D.C.—It has been agreed to purchase a tar-sprayer, at a cost of £40.

Chelmsford T.C.—The Local Government Board having written suggesting the postponement of the work of wood paving Duke-street to the railway station, the loan for which was sanctioned last July, Messrs. W. Griffiths & Co., the contractors, wrote that they were prepared to accept payment, plus 15 per cent for loss of interest, for the actual money paid on account of the contract for wood blocks and reinforcement, and waive all rights in the contract for the execution of the works. As an alternative, they suggested that they should complete the work at once, they agreeing to allow any balance not already borrowed to remain for two years at 5 per cent interest, by which time the war would probably be over. The council have agreed to accept the alternative offer, subject to the consent of the Local Government Board.—The tender of Messrs. Davey & Armitage, Southend, at £652, has been accepted for making up Braemar-avenue.

Crompton U.D.C.—An intimation has been received from the county council that they have sanctioned £819 for special work on roads in the Crompton area.

Dover T.C.—It is proposed to purchase six electrical vehicles for scavenging purposes.

Durham C.C.—The council have approved a recommendation of the Works Committee to proceed with the improvement of the Great North Road between Darlington and Durham. A grant of £24,657 for the work has been made by the Road Board and sanctioned by the Treasury, and application is to be made for a loan from the Board of £78,102, without interest,

for seven years. The council have referred the question of improving the Gateshead-to-Durham section of the North road to a sub-committee, with power to carry out the work, but not before the application to the Road Board for a loan has been made.—Other works to be carried out include the widening of the main road on the hill immediately north of Chester-le-Street, at a cost of £460, exclusive of the purchase of land; the purchase of land to improve a dangerous corner opposite Neville's Cross Hotel; and the paving of the carriageway over Elvet Bridge, Durham, at a cost of £672.—It has been decided to purchase three steam tractors.

Epsom R.D.C.—Application is being made to the Local Government Board for sanction to the taking over and making up under the Private Street Works Act, 1892, of Bridgefield-road, Grove-road and Landseer-road, on the Bridgefield estate, Cheam.

Hazel Grove U.D.C.—The surveyor, Mr. G. S. Doncaster, has received instructions to widen Commercial-road, from the Royal Oak Hotel to Bolton Fold-road.

Herts C.C.—Towards the cost (£17,315) of resurfacing the main road from Watford to Boxmoor it is hoped to receive a grant of £15,583 from the Road Board.

Middlesbrough T.C. It has been agreed to put in hand the widening of Morton-road, from Clairville-road to Highfield.

Perth T.C.—The Works Committee have decided to tar-pave the roads of the city.

Poplar B.C.—The Works Committee have adopted a proposal to lay down creosoted deal paving in part of Roman-road, at an estimated cost of £1,100.

Renfrew C.C.—At the Roads Committee meeting of the Upper District Committee a letter was read from Mr. W. Rees Jeffreys, secretary to the Road Board, stating that during the coming financial year the board propose to make grants towards the cost of road crust improvements which are immediately required, but that, unless special circumstances can be shown, such grants will be on a considerably reduced scale, and will only be made in the case of important roads, the improvement of which cannot properly be postponed. The road surveyor, Mr. Robert Drummond, reported that the letter referred principally to improvements of a permanent nature, such as had recently been carried out on Kilmarnock road; but he thought that the application made by the district committee for a grant to aid the annual tar-spraying, &c., of roads may be held to come under the description of works that cannot be postponed without either public inconvenience or the risk of serious disintegration of the improved crusts already laid down. The committee agreed to adhere to the whole claim already made for grants for road improvements during the ensuing year.

St. Germans R.D.C.—It was reported that only one tender had been received for the reconstruction of Weard-road, St. Stephens. The chairman said the tender received was unreasonable, and he thought the council could resort to direct labour. The surveyor, Mr. H. A. Hosking, was instructed to carry out the work and obtain as much labour as he could.

Seaford U.D.C.—The surveyor, Mr. B. A. Miller, recently had an interview with an officer from the War Office, who inspected the roads and went carefully through the surveyor's specification, and he decided that many roads were to be repaired, and the estimates forwarded to the Road Board. The estimates amount to £8,779.

Stockport T.C.—The borough surveyor, Mr. J. Atkinson, submitted recently a report on a proposed improvement at St. Petersgate, and the Tramways Committee agreed to the suggestion that the tramway rails should be raised and the road completed with granited rock asphalt, subject to the Highways Committee obtaining satisfactory tenders for the work.

Sunderland R.D.C.—The surveyor, Mr. T. Young, has received instructions to prepare plans and estimate of cost for a new road between the villages of Castletown and North Hylton.

Swansea T.C.—Plans have been approved for the construction of new roads at Pentrepoeth.

Wandsworth B.C.—A scheme has been adopted for the improvement of the approach to Wandsworth Bridge, at an estimated cost of £90,000. It is hoped to receive the greater part of the money from the Road Board.

Westhampnett R.D.C.—Road tarring operations are to be carried out at an estimated cost of £200.

Westhoughton U.D.C.—A new steam roller is to be purchased at a cost of £400.

SEWERAGE AND SEWAGE DISPOSAL.

Ballymena U.D.C.—It has been decided to defer the proposed scheme of wholesale substitution of water-closets for privies until the district is provided with a sufficient water supply, and that individual cases of insanitary dwellings be reported to the council and dealt with.

Cumberland C.C. The council have forwarded to the Local Government Board a report by the medical officer of health on the sanitary condition of Longtown, stating that, in his opinion, nothing short of a complete sewerage system for the whole village, the abolition of midden privies, with the substitution of water-closets, and the provision of satisfactory receptacles for house refuse, will ever make the sanitary condition of the district satisfactory. It is understood that the district council have had such a system under consideration, and that they are prepared to consider such a scheme at a more opportune time.

Nottingham T.C.—A small decrease in the number of pail closets in Nottingham is reported in the annual report of the corporation nightsoil department. The number was reduced from 31,084 in 1913 to 32,651 last year. Dry ashbins have increased by 1,645, to 31,600. With the exception of a short time in June or July, when farmers were busy with the harvest, the whole of the nightsoil has been sold.

Paisley T.C.—At this week's meeting it was intimated that a letter had been received from the Secretary for Scotland inquiring if any action had been taken by the council since his letter of February last on the subject of the pollution of the river Clyde by sewage from the burgh. The clerk stated that he had replied to the communication, and explained that in the existing position of affairs the Drainage Committee did not consider themselves justified in proceeding further with the matter at present.

Swindon T.C.—Mr. Midgley Taylor has prepared an amended scheme for the extension of the Rodbourne sewage disposal works, which will be submitted to the Local Government Board in due course.

Whitby R.D.C. It was resolved on Saturday to proceed with the drainage scheme previously authorised on the Mill Seat estate, Goathland.

Whitstable U.D.C.—The council have purchased for £1,604 a site for the purpose of sewage disposal works.

WATER, GAS, AND ELECTRICITY.

Aberdeen T.C.—The corporation last week agreed to apply for a Provisional Order in connection with the scheme for an improved water supply, the estimated cost of which is £500,000.

Aberystwyth T.C.—The council are seeking authority to spend £3,900 upon new waterworks.

Barrow-in-Furness T.C.—A scheme has been adopted for the extension of the electricity main in Abbey-road, at an estimated cost of £725.

Boston R.D.C.—The medical officer, Dr. S. S. Rendall, reporting on the water supply of the district, states that the water cannot at the present time be considered safe to drink. "I have received," he proceeds to state, "many complaints from residents both as regards the quantity and quality of water supplied to them. I should again like to emphasise the fact that a surface water (as at present supplied) can never be an entirely satisfactory one, and I also wish to remind you of the excellent and ample supply of deep well water that exists at Bourne and at Donington."

Bristol T.C.—The Electrical Committee on Tuesday reported that the cost of increasing the supply of feed water at Wapping Electrical Works was £1,744, the borrowing of £1,398 of which had been sanctioned. The excess expenditure of £341 was due to unforeseen circumstances, and they asked for authority to apply for a further loan to that amount. They also recommended the provision of a 6,000 k.w. turbo alternator at these works, at an estimated cost of £26,949, and authority to apply for a loan. The growth of the undertaking necessitated the additional plant. The report was adopted.

Clacton U.D.C.—A tar-dehydrating plant is to be installed at the gasworks, at an estimated cost of £300.

Connah's Quay U.D.C. — The electric lighting scheme has been [illegible] to the urban district.

Coventry T.C. The Electric Lighting Committee has been authorised to effect the extension of the switchboard and cabling at an estimated cost of £870.

Edinburgh T.C. The Electric Lighting Committee have resolved to recommend the council to enter into a contract with the trustees of the late [illegible] for certain works of Parliament, an estimate for the Stirling Bridge Company, Limited, for water [illegible] value of the same £2,000.

Exeter T.C. The Waterworks Committee recommend the city council to provide a new [illegible] and a double pump at the waterworks.

Halifax T.C. It is proposed to re-build the wall and raise the reservoirs at the [illegible] Water Lane Dean at a cost of £1,000.

Kingstown U.D.C. Various schemes are to be prepared for a sewerage system at Kingstown and Glenageary area.

Lisburn U.D.C. A letter has been received from the Local Government Board stating [illegible] with the council's proposal to extend the water supply, at the district rate, that they had given sanction for the preparation of a draft Provisional Order in accordance with the recommendations of their chief engineering inspector, subject to the [illegible] application at once to deal with the extended area, and the omission of all reference to the electricity undertaking, charges on the [illegible] and the Boiling Well [illegible] and Harbour Estate.

Nottingham T.C.—The balance of profit on last year's working of the gas undertaking was £[illegible] of this £45,000 has been paid to the general district rate, £30,000 placed to the general fund, and £10,000 carried forward.

Stafford T.C. The [illegible] part of the gas undertaking for [illegible] and the [illegible] to borrowing £342.

Stepney B.C. The council have received the consent of the Treasury to a loan of £15,000 for electricity extensions for the purposes of war contracts.

Torquay T.C.—The Electric Lighting Committee reported that the Local Government Board had intimated that they were not satisfied that there was any necessity for the purchase of premises on Victoria-parade for new offices and stores, and that if the council proceeded with the purchase they must not look to them for any contribution towards the loan. The expenditure of this kind could not be sanctioned at present. The committee, however, adhered to the proposal for acquiring the premises and instructed the town clerk to proceed with the purchase. The engineer urged that it was imperative that his department should be supplied with temporary offices, and it was decided that the town clerk should negotiate for a temporary tenancy of 11 Beacon-terrace.

West Penwith R.D.C.—It was reported last week that all the wells at Chacewater had been [illegible] and that the new water supply was considered satisfactory.

Wolverhampton T.C. Several extensions of electricity mains are recommended by the Electric Committee.

Woolwich B.C. The Finance Committee recommend the borough council to apply for the sum of £25,000 for the purposes of the electricity undertaking.

MISCELLANEOUS.

Birmingham T.C. The council are to be recommended to purchase another motor ambulance at a cost of £630.

Northallerton U.D.C. The council has decided not to allow the fire brigade to attend fires in the rural areas unless the rural council contribute £35 per annum towards the upkeep of the brigade.

Nottingham T.C.—The council on Monday, in granting a war bonus of 2s. a week to those of its workmen who are earning 30s. a week or less, made an exception in the case of single men of military age. These will get nothing extra.

Sunbury U.D.C.—Increases in wages of 2s. 6d. per week during the continuance of the war have been given to roadmen, and 5s. per week each to the foreman and engine-driver at the sewage works.

PERSONAL.

Mr. A. J. Marshall, borough surveyor of Merthyr, has had his salary increased by £50 a year.

Mr. W. Clark, burgh surveyor of Tayport, has been appointed burgh surveyor of Newport, Fife.

Mr. Fred. Turner, borough engineer of Morley, has had [illegible] increased to £90 per annum.

Mr. Peter Miller has been appointed assistant road [illegible] the Dumbarton County Council, at a salary of £[illegible].

Mr. W. L. Hibberd, surveyor to the Catherington (Hants) Rural District Council, has received an increase of salary.

Mr. [illegible] surveyor to the Rake borough Urban District Council, has been voted an [illegible] of salary.

Mr. James Andrew has been appointed road surveyor to the Dumbarton County Council, at a salary of £350, in succession to Mr. A. Wilson.

Mr. J. Weekes, burgh surveyor of Newport, Fife, has been appointed burgh surveyor, master of works, and sanitary inspector for the burgh of Irvine.

Mr. J. B. Fallowfield, surveyor to the Church Urban District Council, has been appointed engineer at the Gold Coast under the Crown Agents for the Colonies.

Mr. H. Lightfoot, draughtsman in the city engineer's office, Newcastle-upon-Tyne, has been appointed engineering assistant to the Port of London Authority.

Mr. Robert McKellar, assistant sanitary inspector at Wallsend, has been appointed sanitary inspector to the Hebburn Urban District Council, at a salary of £120, rising to £150 a year.

Mr. G. C. Mitchell, assistant borough engineer of [illegible] has been voted £[illegible] in consideration of extra services rendered during the illness of the [illegible] Mr. M. H. [illegible].

Mr. H. V. Lanchester will read a paper entitled "The Evolution of the Architectural Competition," at a meeting of the Royal Institute of British Architects [illegible] Monday next.

Mr. A. W. [illegible] surveyor to the Dumbarton County Council, who has resigned, has been appointed advising road surveyor and consulting engineer to the council, at a salary of £[illegible] per annum.

Mr. F. C. Cook, borough engineer of Nuneaton, who has been gazetted temporary Captain in the Army, and is in command of the 216th (Fortress) Company Royal Engineers, has been granted [illegible] by the town council.

Mr. Waude Thompson, ASSOC.M.INST.C.E., deputy borough engineer and surveyor of Burton-on-Trent, who, as already announced, has been appointed borough surveyor of Mansfield, was recently presented by his colleagues at Burton with a dinner wagon. The presentation was made at the [illegible], Mr. John B. Chapman, and the borough engineer and surveyor of Burton, Mr. G. T. Lynam, in supporting Mr. Chapman's remarks, [illegible] Mr. Thompson's ability as an engineer and sterling character, of which he spoke with confidence from his thirteen years' close acquaintance with him in the public works department. He [illegible] Mr. Thompson [illegible] success in his new sphere, he could not help feeling [illegible].

OBITUARY.

Mr. W. A. Collins, surveyor to the Bridgwater Rural District Council, died on April 17th [illegible] in his [illegible] year.

Mr. H. F. Friederichs, borough electrical engineer of West Hartlepool, [illegible] years, we regret to state, on Sunday last. He was [illegible] years of age, and was [illegible] of Penrose, [illegible] Mr. Friederichs [illegible] West Hartlepool in 1889 as [illegible] A. W. Kaye, [illegible] in connection with the [illegible] of the corporation's electricity undertaking, and when the generating station had been built and the plant laid down, he was appointed borough electrical engineer, a position he had since filled with great ability.

Mr. J. Rush Dixon, M.INST.C.E., borough engineer and surveyor of Woolwich, died, we regret to state, on the 6th inst., as the result of a heart attack. He was only forty-six years of age. He received his

early training at Carlisle, and eventually became an assistant in the city engineer's office there, under Mr. W. Howard-Smith. In 1894 he was appointed engineering assistant at Walsall, and in that capacity had charge of the construction of extensive outfall sewerage works. In 1896 he became deputy surveyor to the old Shoreditch Vestry, and upon the death of the chief surveyor, shortly afterwards, he was appointed his successor. In 1899, upon the passing of the Act establishing the metropolitan borough councils, he was unanimously elected borough engineer and surveyor of Shoreditch, where he remained until 1905, when he succeeded the late Mr. Frank

THE LATE MR. J. RUSH DIXON.

Sumner, M.INST.C.E., as borough engineer and surveyor of Woolwich. In addition to his membership of the Institution of Civil Engineers, Mr. Rush Dixon was a member of the Institution of Municipal and County Engineers. He served for some time on the council of the latter body, and did excellent work for several years in the capacity of hon. secretary of the Metropolitan District of the institution. His loss will be regretted by a wide circle of friends, both in and outside the ranks of the profession. The funeral took place on Tuesday last at Plumstead Cemetery.

Sunday Road Watering in Camberwell.—It was recommended last week, in order that the Sunday watering of the Camberwell roads shall not be discontinued owing to the present shortage of men and horses, that the borough council's permanent workmen should be asked to volunteer their services for the work, pay to be at the rate of time and a half.

FOR OTHER ADVERTISEMENTS
See End of Paper.

WANTED, in the Borough Surveyor's Office Burton-upon-Trent, a General Assistant. Must be good Surveyor, Leveller, and Draughtsman. Salary £100 a year. Synopsis of duties may be obtained from the Borough Surveyor, to whom applications, accompanied by copies of three testimonials, must be sent before the 29th inst. (2,569)

CLERK. — Required, a temporary clerk (not eligible for Army), immediately, for duration of war. Must be expert shorthand writer and typist. Applications, in own handwriting, stating age, experience, and wages required, and accompanied by testimonial from employer, to be sent to the Borough Engineer, Municipal Offices, Cheltenham. (2,568)

BRIDGWATER RURAL DISTRICT COUNCIL.

APPOINTMENT OF HIGHWAY, PLAN AND GENERAL SURVEYOR AND WATER ENGINEER.

Applications are invited for the above position.

Applicants to have had practical experience in Highway Maintenance and Administration, and must be qualified to prepare Plans, Bills of Quantities and Estimates for Sewage, Building, and other schemes, and to supervise and carry through same.

Applicants must be familiar with all matters appertaining to Waterworks undertakings, and to be a capable water engineer.

Salary £250 per annum, rising by annual increments of £25 to a maximum of £325.

The Council will also make a grant of £50 per year to the person appointed for travelling expenses, and he will be expected to provide himself with a motor or motor cycle, and to defray the maintenance thereof, together with the running expenses.

Two Assistants are assigned to the Surveyor's Department, and the person appointed will be permitted to take not more than two pupils.

Applications, in Candidate's own handwriting, endorsed "Highway Surveyor, &c.," and accompanied by copies of not more than three recent testimonials, must be sent to the undersigned not later than Tuesday, 8th June, 1915.

Appointment is subject to the approval of the County Council.

Canvassing will disqualify.

T. M. REED,
Clerk to above Council.

Rural District Council Office,
Bridgwater.
May 12, 1915. (2,570)

CORPORATION OF MADRAS.

SPECIAL WORKS DEPARTMENT.

CONTRACT M & M, No. 22—A.

The Corporation of Madras is prepared to receive Tenders from competent persons willing to enter into a Contract for the Supply and Delivery of Cast-iron Pipes, Special Castings, Sluice Valves, Hydrants, &c. The total weight of the pipes and special castings is about 4,700 tons, the diameters varying from 2½ in. to 42 in.

Forms of Tender prepared by J. W. Madeley, Esq., M.A., M.INST.C.E., M.AM.SOC.C.E., &c., Special Engineer, Corporation of Madras, may be obtained from the undersigned on payment of 10s. each, which will not be returned.

Tenders, accompanied by a deposit in currency notes, or a draft on a Madras Bank of Rs.500, should be sent direct to the President, Corporation of Madras, so as to reach him at or before 12 noon on the 14th day of July, 1915.

The Corporation does not bind itself to accept the lowest or any Tender.

JAMES MANSERGH & SONS,
Agents to the Corporation of Madras.

5 Victoria-street,
Westminster.
May 12, 1915. (2,571)

TILBURY URBAN DISTRICT COUNCIL.

ROAD IMPROVEMENTS.

The above Council invite Tenders for the following:—

Supply only.

10,000 gallons (about) approved Refined Tar complying with the Road Board's Specification, No. 4, for Tar No. 1.

Supply and lay on foundations prepared by the Council (for trial sections).

(1) 1,000 sq. yds. (about) Bituminous-bound Granite (graded).
(2) 1,000 sq. yds. (about) Tarred Slag-macadam.
(3) 1,000 sq. yds. (about) Tar Paving.

Forms of Tender, &c., may be obtained from Mr. S. A. Hill-Willis, ASSOC.M.INST.C.E.I., Engineer and Surveyor to the Council, on and after Wednesday, the 19th May, 1915, on the production of a receipt from the Council's Accountant for a deposit of £2, which will be refunded on the receipt of a *bonâ-fide* Tender.

The Contract will contain the form of Clauses adopted by the Council respecting wages, hours, conditions of labour, &c., which the accepted Contractor will be required to sign.

Sealed Tenders, on the Form and in the envelope provided, addressed to the undersigned, are to be delivered not later than the first post on Monday, the 31st May, 1915.

The Council does not bind itself to accept the lowest or any form of Tender.

(By order)
THO. A. CAPRON,
Clerk to the Council.

Council Offices,
Dock-road,
Tilbury.
May 12, 1915. (2,572)

Asphalt and Its Application in Sanitary Work.*

By NANDY HOSKINS

[illegible] not fully understood.

[illegible] in saying this I do not distinguish too closely between the municipal and the sanitary engineer or the architect. He is called upon to advise and design for all [illegible] munity, and is frequently perplexed as to what material may best meet the requirements in special cases.

NOMENCLATURE.

The subject cannot be even superficially treated without first differentiating between asphalt and bitumen, their allied compounds and their substitutes.

[illegible] recently compiled by Mr. H. Percy Boulnois [illegible] manufacturers and users [illegible] rials.

[illegible] to speak of tar-paving as asphalt, or, maybe, ashfelt, and it is not only "the man in the street." The [illegible] large provincial town where a candidate specified 6 in. of asphalt for a footpath. On pointing out to him [illegible] with, he said that he could not know, as part of his daily duty was to superintend the laying of the stuff for the borough council. Thinking that the council may have discovered a mine in the vicinity, [illegible] tained, and he replied that the council made their own from broken stone and tar.

Without claiming originality, or attempting to criticise the publication just referred to, the following interpretations are intended to apply to this paper:

Asphalt.—A general term applying to any and every description of asphalt or crude bitumen.

Rock Asphalt.—Limestone or sandstone naturally impregnated with bitumen.

Lake Asphalt.—Crude bitumen.

Compressed Asphalt.—Pulverised rock asphalt heated and consolidated under pressure.

Mastic Asphalt.—A preparation of rock asphalt and additional bitumen, with or without an admixture of coarse sand or grit.

Artificial Asphalt.—A mixture of pulverised limestone and grit made plastic with bitumen.

Bitumen.—A mixture of hydrocarbons in a solid or viscous state which are wholly soluble in carbon bisulphide and almost insoluble in alcohol.

Maltha.—Crude bitumen in a semi-fluid condition.

Pitch.—The residuum from the distillation of coal tar, wood tar, &c.

Bituminous Mastic.—Any mixture composed of pulverised stone or grit made plastic with or containing pitch or tar products. . . .

ORIGIN OF BITUMEN.

Many theories have been advanced as to the origin of bitumen in Nature. It is so closely allied to petroleum in composition that the formation of one cannot be considered without reference to the other.

Parkes' Chemical Catechism states "naphtha is a fluid and transparent as water, but when exposed to the air it becomes yellow, and then brown, its consistence is increased, and it passes into petroleum. Petroleum is found native in many countries, and by an exposure to the air becomes mineral tar. Mineral tar is also found native, which, by exposure to the air, passes into mineral pitch and maltha. By further induration this passes into asphaltum, which substance is likewise found native in many parts of the world."

It will be seen, therefore, that to arrive at the formation of bitumen and asphalt we must first consider the origin of naphtha.

The word naphtha is derived from the Persian *naftia*, to oust out; but in this country the word is usually confined to a distillation from coal tar or [illegible]

[illegible] occurs in enormous quantities in some very ancient rocks (silurian and carboniferous), and also in much later deposits (early tertiary), and it is evident from its chemical composition that it is of organic origin. Accumulations of vegetable and animal organic matter which, under certain conditions, would have resulted in peat and finally coal, have, as the result of peculiar circumstances, passed through various stages of decomposition by the influence of what has become known as "marsh gas" bacteria, and been converted into a liquid.

[illegible] PROPERTIES OF BITUMEN.

The island of Trinidad, B.W.I., is noted for the most remarkable deposit. Here, in the south-west portion of the island, is the famous "Pitch Lake," so named by Sir Walter Raleigh, who discovered it in 1595. He noted that the lake contained "abundance of stone pitch, that all the shippes of the world might therewith be laden from thence, and we made trial of it in trimming our shippes, to be most excellent good, and melteth not with the sun as the pitch of Norway."

The lake has many peculiarities. It covers about 100 acres, is roughly circular in shape, probably occupying the crater of an extinct volcano, and is [illegible] In 1887 an attempt was made to determine its depth at the centre by boring, but after sinking to a depth of 135 ft. the tubes had inclined to such an angle that the attempt had to be abandoned. There are several islands having rich vegetation in, or rather on, the lake; these, owing to the motion of the "pitch," are continually changing their position.

Quoting from Chas. Kingsley's description of the lake in his interesting book, "A Christmas in the West Indies," he says: "Conceive a crowd of mushrooms, of all shapes, from 10 ft. to 50 ft. across, close together, side by side, their tops being kept at exactly the same level, their rounded rims being squeezed tight against each other; then conceive water poured on them so as to fill the parting seams, and in the wet season, during which we visited it, to overflow the tops somewhat; thus would each mushroom represent tolerably well one of the innumerable flat asphalt bosses which seem to have sprung up each from a separate centre, while the parting seams would be of much the same shape as those in the asphalt, broad and shallow atop, and rolling downward in a smooth curve, till they are at bottom mere cracks from 2 ft. to 10 ft. deep. Messrs. Wall & Sawkins explain the odd fact clearly and simply. The oil, they say, which the asphalt contains, when it rises, first evaporates in the sun, of course most on the outside of the heap, leaving a tough coat of asphalt which has, generally, no power to unite with the corresponding coat of the next mass. Meanwhile Mr. Manross, an American gentleman, who has written a very clever and interesting account of the lake, seems to have been so far deceived by the curved and squeezed edges of these masses that he attributes to each of them a revolving motion, and supposes that the material is continually passing from the centre to the edges, when it 'rolls under' and rises again in the middle. Certainly the strange stuff looks, at the first glance, as if it were behaving in this way, and certainly also his theory would explain the appearance of sticks and logs in the pitch. They are often several feet in length, and 5 in. or 6 in. in diameter. On reaching the surface they generally assume an upright position, one end being detained in the pitch, while the other is elevated by the lifting of the middle. They may be seen at frequent intervals over the lake, standing up to the height of 2 ft. or even 3 ft. They look like stumps of trees protruding through the pitch, but their parvenu character is curiously betrayed by a ragged cap of pitch which invariably covers the top, and hangs down like hounds' ears on either side."

The lake has been worked under a concession granted by the British Government for some twenty-

* Paper read at a meeting of the Institute of Sanitary Engineers held at Caxton Hall on the 5th inst., Mr. H. Percy Boulnois (past president) in the chair.

seven years, during which period some millions of tons of the material have been exported, the bulk of it going to the United States, but large quantities being shipped to this country by Messrs. Previte & Co., of London.

The crude material is dug from the surface of the lake, and, although several tons may be removed in a single day, within thirty-six hours the excavations are said to refill by the exertion of the natural pressure from below. The material is taken in iron skips to an aerial railway, which conveys it to the sea, some 800 yds. distant, for shipping.

Asphalt is also found beyond the boundary of the lake, especially between the lake and the sea. This is termed land asphalt. It is questionable how it got there, but the supposition is that the lake, at some early date, overflowed its banks. Although the physical properties of the asphalt varies considerably, even in the lake itself, as may be seen by the specimens exhibited, the chemical composition is extremely uniform.

Before the crude asphalt can pass to any of the many uses for which it may be intended it must undergo a process of refining, as it contains some 30 per cent of water besides organic matters which it is necessary to eliminate. This is usually done in tanks about 15 ft. deep filled with coils of 1½-in. pipes about 6 in. apart. The coils carry steam at 100 lb. pressure, corresponding to a temperature of about 325 deg. Fahr. At this temperature the asphalt, which is liquid, is run into casks, and as known as epuré. In this condition it is ready to be converted by the addition of a flux into what is called for trade purposes "Refined Trinidad Lake bitumen."

Another extensive deposit of lake asphalt is that at Venezuela, Bermudez. This covers an area of some 1,000 acres, but is very shallow compared with the Trinidad Lake. It varies in consistency in different parts of the lake from viscous maltha to solid bitumen. The crude material is richer in bitumen than that of Trinidad, but the composition of the refined bitumens is not identical in each.

Deposits are also found in Cuba and other parts of the world.

ROCK ASPHALT.

Rock asphalt is entirely different, both physically and chemically, from lake asphalt; in fact, the only thing common to each is that they both contain bitumen. The following is a comparison:—

DIVERSITIES OF LAKE AND ROCK ASPHALTS

	Trinidad Lake. (dry.)	Rock (Seyssel.)
Specific gravity... ...	1·4	2·25
Hardness ...	plastic	tough
Inflammability ...	inflammable	fire resisting
Fracture ...	conchoidal	rough
Melting point ...	170 Fahr.	(disintegrates)
Bitumen content ...	54	8
Calcium carbonate ...	...	91
Sulphur	3	—
Mineral matter (silica)	35	—
Organic matter	8	—

Rock asphalt is correctly described as a limestone naturally impregnated with from 6 to 14 per cent of bitumen, which gives it a rich brown colour. When the bitumen is extracted by means of a solvent the limestone is left in a state of very fine subdivision, and we might consider briefly how the stone became impregnated.

Few rocks vary more in texture and composition than limestone; it may be a friable chalk-like deposit, a finely-grained rock resembling sandstone, or a hard, close-grained mass having a conchoidal fracture. In rock asphalt we have an example of a finely-grained deposit, the particles being cemented together, as it were, with what would first appear a foreign matter. The deposits are found in various thicknesses, 6 ft. and less to over 20 ft., and are at times laminated. The existence of laminæ indicates tranquil conditions of intermittent deposit, and such thin layers occur only where the mineral is fine-grained, as in mud or shale. The alternation of thin bands of laminated rock with others non-laminated indicates considerable oscillation of currents from various quarters bearing different quantities and qualities of sediment.

The conditions favourable to the formation, or rather to the impregnation of limestone with bitumen are the diffusion of organic material, either vegetable or animal, through the finely-divided calcareous deposit and the exclusion of air from the material undergoing decomposition. There is reason to believe that no more heat was required than that afforded by the process of fermentation to bring about the changes by the aid of anaërobic bacteria. It is probable that the organic matter was in the form of delicate water plants, together with abundant infusorial or microscopic vegetable life. That the unimpregnated laminæ should exist between the impregnated rock is conclusive proof that the bitumen-forming agents must have been entombed in the lime deposit, and that the impregnation was not brought about by external emanations, as is sometimes suggested.

PRINCIPAL DEPOSITS OF ROCK ASPHALT.

Rock asphalt appears to have been discovered in the Val de Travers, Switzerland, by a workman named Jost, who brought it to the notice of a Greek physician named Eyrinis in 1712, and he was granted a concession by the King of Prussia to work the rock.

However, the credit is, I believe, due to Count Sassenay for starting the asphalt industry on business lines and correcting mistakes made by Eyrinis, mentioned hereafter. In 1802 Count Sassenay secured the concession of the Seyssel Mine, and carefully investigated the properties of the rock and trained his workmen in the proper methods of using it.

The principal deposits on the Continent which are used in this country are found at Val de Travers (Switzerland), Limmer and Vorwohle (Germany), Pyrimont, Seyssel (France), Ragusa (Sicily).

The rock is quarried or mined, according to whether the seam is near or far below the surface of the ground. As previously stated, the seams vary in thickness; they also vary considerably in texture and composition, even from the same quarry.

MASTIC ASPHALT.

Mastic asphalt is a mechanical mixture made by intimately compounding powdered rock asphalt with additional bitumen, and with or without an admixture of coarse grit.

Dr. Eyrinis appears to have conceived the idea of using mastic asphalt for building purposes. In a work published by him in 1721 he describes its preparation in the following terms: "The stone is taken just as it comes from the mine and heated a little so that it can be ground to a coarse powder. A little pitch is added to it so that it will fuse the more readily, and also cause the entire mass to become thinner, and then the whole is heated over a moderate coal fire.

"The wood or stone upon which the cement is to be spread must have been previously well dried and also heated a little. When using the cement upon stone the present custom has been to add 1 part of pitch to 10 parts of the asphalt. For use with wood rather more pitch must be added. When, however, marine work is being put in hand, it will be necessary to supervise the workmen with the greatest care in order that their work shall be as may be best suited for the particular purpose, though it will suffice for the present to add that the asphalt in question becomes softer and more liquid the more it is heated. In carrying out the fusing of the asphalt, however, it is always necessary to add a little pitch. The fusing should be carried out in a copper cauldron containing the exact quantity of asphalt that may be required for the work then being put in hand.

"The pitch must be melted first, then the asphalt added little by little, the mixture being continuously stirred throughout with a stick or shovel, until both materials have become intimately mixed together. Resin makes it harder and causes it to withstand the heat of the sun better. Dutch pitch, obtained from the roots of trees, makes it tougher. The mixture must consist of 1 part of pitch to 7 common pitch and 8 or 9 parts of asphalt, according as to whether it is desired to make it more or less liquid—depending upon the nature of the work to be done—and before it is quite cool this cement can be levelled or brought to a smooth surface by means of a hot iron such as is used by builders for cement work. Above everything else, the workman must take care that the stone or other material to be coated shall be thoroughly cleaned before the cement is laid upon it, and then if any weakness is found afterwards in the work it cannot be occasioned by the material used, but only by the kind of use and the method adopted in the spreading of it."

As may be imagined, Dr. Eyrinis' method was not successful, the cause of failure evidently being due to the unsuitable material used as a flux, and let it be stated that the cause of dissatisfaction in mastic asphalt work to-day is largely due to the same cause

Substitutes for bitumen, such as gas tar, pitch, and petroleum refuse, have a deleterious effect on rock mastic asphalt, and should never be used.

The process of manufacture of mastic asphalt, as carried out by one or more well-known firms, and which may for our purpose be accepted as the method generally adopted, is to first crush the natural rock to pieces about the size of walnuts. After passing through the crusher the asphalt is carried up by elevators to a disintegrator which runs at a high speed, grinding the material to a fine powder. The powder is then cooked in specially made cauldrons, worked by agitators with certain proportions of bitumen, and when heated to a temperature of about 300 deg. Fahr., a proper on of from 10 to 20 per cent of fine grit is added to make gritted mastic, and which is thoroughly incorporated with the asphalt by the rotary working of the agitators. It is then turned out into iron moulds and made into blocks of various shapes weighing about ¼ cwt. each.

To apply the mastic these cakes are broken into small pieces and carefully placed in a cauldron with just sufficient bitumen as a flux. It is then heated to a temperature of about 280 deg. Fahr., the whole being carefully stirred until properly cooked. When ready it is taken from the cauldron with an iron bucket and spread by means of hand floats to the required thickness and rubbed with fine sand. As the mastic is likely to have blowholes, it is important that it should be applied in two coats where required for damp proofing.

TESTS FOR ASPHALT.

The following tests on asphalt as may be applied by an engineer or architect, but it is pointed out that special apparatus, as also an intimate knowledge of analytical chemistry, is necessary to determine the exact composition of the material we are now considering. Much useful information on this subject is contained in "Natural Rock Asphalts and Bitumens," by Arthur Danby, who has kindly permitted the author to cull some of the following tests:—

A simple method to adopt in order to tell one artificial bitumen from another consists in holding the product over an open flame and smelling the vapours which are given off. The residues from coal tar, wood tar, and tar oil obtained, each of which has its own distinctive odour, is easily noticeable when the material is heated.

A definite test for the presence of coal-tar pitch in a suspected material is based on the fact that it contains a quantity of free carbon in contrast with the natural bitumen, which contains none. Natural bitumen presents a uniform brownish appearance when a little is rubbed on a piece of ground glass and examined under a microscope. In an adulterated sample the free carbon may be seen suspended in the bituminous matter like small black dots, though to the naked eye the mass appears to be true bitumen.

Mastic should be able to be cut with a knife. If of too hard or stony a nature, it proves an insufficiency of bitumen.

When held in a gas flame it should soften; it should never run or begin to ignite. If it burns the mastic contains too much flux, and for practical purposes the material will prove too soft.

APPLICATION OF ROCK ASPHALT.

As a material for paving streets asphalt has much to recommend it from a sanitary point of view. It is non-absorbent, easily cleansed, and suffers no material change from variations of temperature. Its suitability for this purpose was discovered by accident in 1849. Fragments of asphalt dropping from the carts which transported it from the quarry along the road became heated by the sun, and were crushed to powder and compacted by the continual passage of the carts until a hard, smooth track was formed. The phenomenon thus presented, followed by many experiments, led to the perfect method of constructing the rock asphalt road now in use.

In 1854 the first street of compressed asphalt was laid in Paris, and covered an area of 950 sq. yds. The first street to be so treated in London was Threadneedle-street in 1869.

Rock asphalt may be utilised for road paving either as macadam, compressed powder, or as compressed tiles. As a macadam it would appear not to have been quite satisfactory, judging from the report on the Eltham-Sidcup trial road; but the author constructed an asphalt-macadam road several years ago which gave satisfaction.

For compressed work the rock is prepared by heating the powder in revolving cylinders to a temperature of 280 deg. Fahr., and as soon as the moisture has evaporated the heated powder is placed in iron-lined vans, and taken to the street where it is to be laid. The powder is then raked over the prepared concrete surface to the thickness required and rammed with hot pelons, smoothed to a polished surface, and then rolled with a heavy hand roller. It gradually becomes cold, and in time is compressed into solid rock again by the traffic. The usual thickness of compressed asphalt is 2 in. for heavy and 1¼in. for light traffic.

It is essential that compressed asphalt should be laid on a foundation of good Portland cement concrete about 6 in. thick. Neglect in this respect has been the cause of many failures.

APPLICATION OF MASTIC ASPHALT.

Mastic asphalt is a most useful and efficient material, and is eminently suited to meet certain sanitary requirements. It is damp-proof, fire-resisting, vermin-proof, durable, has certain antiseptic properties, and is easily applied by a skilled hand to roofs, floors, walls, and for a variety of purposes in engineering and building works.

DAMP-PROOF COURSES.

To resist damp no better material exists than asphalt or bitumen properly applied. Clause 20 of the Model By-laws issued by the Local Government Board requires that every wall or pier of a new building shall have a proper damp-proof course of sheet lead, asphalt or slates laid in cement or other not less durable material impervious to moisture beneath the level of the lowest floor timbers, and at a height of not less than 6 in. above the adjoining ground.

The by-law is quite clear, but the loose method of applying the terms "asphalted" and "bituminous" to felts treated with coal-tar products tends to bring the genuine article into disrepute; so much so that a circular was recently issued to builders by the district surveyors in London stating that "the material commonly known as 'felt dampcourse,' asphalted felt or similar material will not be approved unless a distinct and sufficient layer of natural asphalt or bitumen is provided in connection therewith."

This cheap substitute for the genuine article cannot be too strongly condemned. No asphalt or bitumen is used in its manufacture, and the fibrous material employed is subject to rapid decay in damp situations.

The author knows of extensive property in London which is in a very unsatisfactory condition owing to this worthless material having been used, and has frequently replaced it in existing buildings with a genuine damp-proof course at great expense to the owners. This, however, is the only remedy.

With respect to the fire-resisting properties of mastic asphalt, much will depend on the quantity of bitumen it contains, the latter material being highly inflammable. It is not only the spread of the fire and the stability of the building that must be considered in case of fire occurring, although these are important factors, but the danger to the firemen employed in its extinction by falling débris. The London Building Act, 1894, sec. 61, states that the flat, gutter and roof of every building, &c., shall be externally covered with slates, tiles, metal or other incombustible materials. It would appear from a recent circular that the London County Council does not consider asphalt an incombustible material. It should be pointed out, however, that it is far more so than some of the metals —*e.g.*, lead and zinc—which are permitted by the Building Act.

APPLICATION OF BITUMEN SHEETING.

For several years past bitumen sheeting has been used for waterproofing purposes, more particularly for horizontal damp-proof courses, lining of reservoirs, sewage tanks, filter-beds, swimming baths, &c., with great success.

The sheeting is manufactured by coating jute cloth on either side with a heavy layer of bitumen. It is made in standard size sheets, each measuring 24 ft. by 6 ft., and is about $\frac{3}{8}$ in. thick. It has the advantage of being more easily laid than mastic asphalt.

It is not suitable for vertical work unless supported on the outer face. The most satisfactory method of fixing in a vertical position, as in the case of reservoirs, &c., is by the use of special wall ties, which are built into both the inner and outer walls.

To fix the material in a horizontal position the sheets should be carefully unrolled and laid over the surface to be covered, due allowance being made for a 3-in. lap at the joints. The sheeting should then be left for a few hours in order that it may take a proper bearing before jointing. A special jointing-iron

... then heated, and carefully passed between the laps to soften the bitumen on the inner surfaces, and these should promptly be united with a wooden mallet.

CAUSES OF FAILURE IN ASPHALT WORK.

The causes of failure are usually due to either the material used or the method of using it. These may be guarded against to a great extent by entrusting the work to a reputable firm. There are few materials which lend themselves to adulteration more than asphalt, and few which require more careful manipulation. Large quantities of low-priced mastic have been imported to this country from Germany, and still larger quantities are "faked" here during their preparation and use. The author contends that the work to be done, however small the job may be, should be executed by the firm's own workmen. The mastic blocks should bear the brand of the firm, and no other material should be allowed to be mixed with them except the bitumen flux

DISCUSSION OF MR. NANDY HOSKINS'S PAPER.

The CHAIRMAN (Mr. H. Percy Boulnois) remarked that he had been exceedingly interested in the paper, as he had had a great deal to do with asphalt in many forms. He had never seen diagrams prepared and put on the screen which displayed the application of asphalt in numerous forms so well as the diagrams shown that night. He believed there were many gentlemen in the room who were old hands with asphalt. He saw Mr. Delano, who was one of the introducers of asphalt, and he remembered that gentleman reading a paper before the Institution of Civil Engineers on the subject. That was many years ago, when he (Mr. Boulnois) was a young man. Mr. Hutchinson, whom he saw present, was also an expert on asphalt. Beginning with the question of bituminous sheeting, he agreed that it was a most valuable material. It was, perhaps, an unfortunate thing that there were so many materials on the market which were more or less substitutes; but if one got the proper bituminous sheeting the effect of its application was admirable. But it must be protected, and this was done, as had been shown on the screen, by applications which were endless. It was the same with mastic asphalt. Years ago he made cheap and lasting urinals with concrete and asphalt. The stalls were covered with asphalt, and they lasted a great number of years, though, as they knew, acid had a bad effect upon asphalt. He took great credit for that work because it had never been done before, and he believed those urinals were existing to this day. With regard to the failures of asphalt, he did not know whether Mr. Delano would agree, but it seemed to him that the asphalt laid on the streets was not so good as it was in the past. Whether there was some defect in the quarries or mines, whether the flux was wrong, or whether the workmen did not understand the job, he was convinced that compressed asphalt was not so good as it used to be. He might say he himself was engaged more or less in 1872 in laying asphalt in Buda Pesth. Asphalt had been used more abroad than in this country, and the reason probably was that under certain climatic conditions it became greasy and slippery for horse traffic. When we substituted, as we ought, mechanical traction for horses, asphalt would come into its own. With regard to failures and blowholes, the latter probably arose from laying the asphalt on something damp. The asphalt was hot, steam was generated, and the water arising therefrom percolated through and made a blowhole. That, of course, was to be guarded against. In conclusion, Mr. Boulnois drew attention to the various exhibits on the table, which, he said, were admirable.

Mr. JOHN HUTCHINSON said that no one could take priority of Mr. Delano in such a discussion as this, and he did not intend to intervene between that gentleman and the audience except for the purpose of calling attention to the fact that twenty years ago a book written by the chairman, Mr. Boulnois, was published with the modest title "Carriageways and Footways." The chairman himself might have [illegible] to the fact that on page 67 there was a chapter on asphalt pavements, and, further, that there was a chapter or two on mastic asphalt. During the twenty [illegible] since it was published this book had been a book of reference, and it contained the very best practice in the making of the asphalt road of to-day. The book consisted of 143 pages, and if those present had time to run over it they would be doing a great service to what was called the road problem.

Mr. BOULNOIS said he must take notice of the extraordinarily flattering remarks of Mr. Hutchinson. If he had done any good to anybody in his life he would be only too pleased. He was pleased to hear [illegible] Mr. Hutchinson as an expert, [illegible] and that, indeed, the book was still "alive." Somebody once said: "Oh, that mine enemy would write a book!" [illegible] truth in what that implied. He had written two books, and when he was in court in a professional capacity he would be reminded that he had written this, that, or the other. On a particular occasion which he recalled the decision was in his favour, but it might have been against him; but his experience was a warning to them not to write books.

Mr. H. D. DELANO observed that the chairman had quoted the saying "Oh, that mine enemy would write a book!" He (Mr. Delano) wrote a book thirty years ago, which was the amplification of a paper he had read at the Institution of Civil Engineers, and the matter with which it dealt was the only point on which he was at variance with the author of the paper read that night. From 1871 he had seen most of the asphalt mines, and had taken special notice of the elements of asphalt. An old friend of his laid it down, and he (Mr. Delano) followed him in the book to which he had made reference, that asphalt should be called bituminous limestone. That might have been from interested motives, it was true. The Americans mixed it with grit, and called it asphalt, and they had been followed by a great many engineers and scientists, and he thought it was a misfortune. With respect to the origin of asphalt, it had been stated that it was formed by the rising of bituminous vapours to the surface. These vapours were forced up into the soft limestone, and the result was the formation of asphalt. They would find that it consisted of layers of non-impregnated limestone, and above them impregnated limestone. There were theories about asphalt being formed by shell animals, but he did not know how it was done. They would notice that there was impregnated and non-impregnated material in the same facing. Streaky asphalt was produced by the action of water. The asphalt in the lake of the Bermudas presented a perfectly flat surface, and it was so glassy that pelicans mistook it for water.

Mr. J. HUTCHINSON, alluding to Mr. Delano's book, said he had searched high and low for it, but he could not find it. He would gladly give a sovereign for a copy, because it was a most useful, practical work, contained [illegible] It was stated in that book that of all the bituminous materials, Trinidad Lake asphalt was the best. They were delighted to find that the author of the paper was himself a practical man. He told them that he had made experiments with natural rock asphalt as a macadam. The first attempt to use natural rock asphalt as a macadam pavement was made at Worthing, and he might say that Mr. Scott, chairman of the Val de Travers Company, [illegible] first of all paviors in Great Britain, and had done more for the advancement of the art than any living man, found that the roads in Sicily were easily made by the action of the passing carts under a hot sun upon the débris dropped from the vehicles carrying rock asphalt. He conceived the idea of bringing the material to this country, and his efforts were attended with success, as every person who had seen the main street of Worthing would admit. The next application made by Mr. Scott was on the Thames Embankment, where, as they knew, there was a great deal of fast and slow traffic. There it proved a non-success. The great secret of a successful asphalt-macadam pavement was to have the rock of a moderate and equal richness in bitumen. He did not know where this was to be found except in Greece, adjacent to a place where there had been an earthquake years ago. Natural rock asphalts were produced in Neuchatel and other places, and they were the premier paving materials of the world. Analytical comparisons had been drawn between lake asphalt and rock. One was described as inflammable, and the other as not. Trinidad asphalt should not be described as an inflammable material; the asphalt cement had to submit to a flashpoint test of over 350 deg. Fahr. He was with the author in saying that natural rock asphalt was the premier material of the world for paving and for sanitary work.

The CHAIRMAN said that with regard to natural rock asphalt being used as macadam, he had seen the work at Worthing, but he had never ascertained what

p cent. It was found that rolled in order to get it down to consistency. The surveyor of Alexandria, Egypt, stated that it was the best material for that climate. Why it had been a failure at Sidcup he (Mr. Boulnois) did not know, but he thought it would be found that an excellent road could be made out of rock asphalt.

Mr. C. T. Evenett seconded that he had seen the asphalt at Calcutta, but it did not stand the climatic conditions there. He moved a vote of thanks to the author of the paper.

Mr. T. J. Mosscrop seconded the proposition. He thought that, take it on the historical, scientific and practical points of view, the paper was both entertaining and interesting. He had lately had to inquire into the bituminous materials used on the special joints of pipes. He had pipes by a well-known maker standing in the sun for a little time, and found the material practically running off the pipes. In another instance he found the material brittle and cracked. He communicated with the Standardisation Committee who had under consideration the standardisation of stoneware pipes, and asked that they would consider a bituminous material. He gathered that this was to be done. He went to the manufacturers for the constituent parts of the materials in their pipes, and they would be surprised at the diversity of the materials. One firm assured him they were making the best article, because they had an experienced man who had been making it for thirty years, and knew how to judge it. As a matter of fact it was not only the material that had to be considered, but also the way it was manipulated. He would ask the author if he had considered what effect sewage had on asphalt—whether it had a deleterious effect on the material.

Mr. Nandy Hoskins, replying to the discussion, suggested that perhaps Mr. Delano did not now agree with what he wrote thirty years ago. Of course, methods had changed, and the methods applying to asphalt had changed with those applying to every other material. He did not know what was the reason for the failure of the Sidcup trial, but he might say that his road was made before ten years ago. As he said, it was excellent, but it worked very slippery. As to the lasting qualities of asphalt, he had instanced a road thirty years old and another which only lasted three years, both put down by the same firm. Of course, this must be caused by difference of surface, as the materials were from the same mine. Blow-holes would arise from putting the material on damp concrete. As to American asphalt, everybody wanted to call their material asphalt, but he did not think the term should be applied to anything except that containing bitumen or a natural material. He could not agree with the suggestion of Mr. Delano that asphalt might be produced from vapours arising from the interior of the earth, for it seemed to him impossible that anything in the form of gas could pass up with impregnated layers on the upper rock. Mr. Hutchinson mentioned the inflammability of lake asphalt, and on that point he would merely remark that he used the comparison to show the difference between the two asphalts. With regard to the Calcutta experiment, he was still of opinion that the material should have another trial in that city. Judging from the sample of the road shown it had been very badly laid, probably on a damp foundation. He had had no experience in connection with the subject of sewage in contact with asphalt.

ROYAL SANITARY INSTITUTE.

SHREWSBURY MEETING.

Mr. H. Percy Boulnois, M.INST.C.E., will occupy the chair at a meeting of the Royal Sanitary Institute which is to be held at the Guildhall, Shrewsbury, on Friday, May 28th, when a discussion on "The Value of Mechanical Filters in the Purification of Water" will be opened by Dr. Thomas Orr.

The proceedings will commence at 7.30 p.m.

On the following morning inspections will be made of the Shrewsbury housing scheme, Ditherington, mechanical filters at Chester-street, and the public abattoir. The members will be entertained to luncheon at one o'clock by the mayor.

BRISTOL MEETING.

On June 11th, at Bristol Guildhall, a discussion on "Co-ordination of Military and Civil Sanitary Services in War-time," will be opened by Dr. D. S. Davies, medical officer of health, and Mr. L. S. McKenzie, ASSOC.M.INST.C.E., city engineer of Bristol.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

President—Mr. J. S. Pickering, M.INST C.E., Borough Surveyor and Water Engineer, Cheltenham.

NORTHWICH MEETING.

A North-Western District meeting is to be held at the Council Offices, Northwich, on Friday, May 28th.

Programme.

11 a.m.—District executive meeting.
11.30 a.m.—District meeting.
Reception in the council chamber by the chairman of the council, Mr. Councillor Worsley, J.P.
District business.
Paper by Mr. J. Brooke, engineer and surveyor, on "Municipal Works of Northwich," which will be taken as read.
Discussion.
12.45 p.m.—Visit to baths.
1 p.m.—Lunch at Lion and Railway Hotel (tickets 3s. each).
2 p.m.—Leave Lion Hotel.
2.15 p.m.—Arrive Marston salt rock mine.
3 p.m.—Leave Marston salt rock mine.
3.30 p.m.—Arrive Anderton lift.
4 p.m.—Leave Anderton lift.
4.15 p.m.—Arrive swing bridge.
4.30 p.m.—Leave swing bridge.
4.35 p.m.—Arrive sewage pumping station.
4.50 p.m.—Leave sewage pumping station.
5.20 p.m.—Arrive Cote Brook waterworks.
6 p.m.—Leave Cote Brook waterworks.
6.15 p.m.—Arrive Blue Cap Hotel (tickets for tea 2s. each).
7.20 p.m.—Leave Blue Cap Hotel.

Tickets for motor char-à-banc 2s. 6d. each.

It is necessary that the nationality of persons attending this meeting should be declared.

A. W. Bradley, M.INST.C.E.,
Hon. District Secretary.

St. Helens.

SOUTHALL MEETING.

A meeting of the Eastern District will be held at the Town Hall, Southall, on Saturday, June 5th.

Programme.

2 p.m.—Meet at Town Hall, Southall.
Business.
Read minutes of previous meeting.
2.30 p.m.—Proceed by motor omnibus (fare 1s. 6d. each)—
(*a*) To visit open-air bath;
(*b*) Through Osterly Park to inspect sewage disposal works.
4.30 p.m.—Return to town hall to tea, kindly provided by the engineer and surveyor, Mr. Reginald Brown, M.INST.C.E.
5.15 p.m.—Discussion of works inspected, and papers by Mr. Reginald Brown (member), "Fourteen Years' Municipal Work in a London Suburb," and Mr. J. H. Edmondson, F.C.S., "Fitting up and Working of a Sewage Works Laboratory."

Conveyances for the various visits have been arranged, tickets 1s. 6d. each.

J. A. Webb,
Hon. District Secretary.

Great Stanmore.

ASSOCIATION OF MANAGERS OF SEWAGE DISPOSAL WORKS.

WIMBLEDON MEETING.

On Saturday, May 29th, a visit will be paid to the Wimbledon sewage works and the S.O.S. works, Durnsford-road, Wimbledon, near Wimbledon Park Station (District Railway).

Members to meet at 3 p.m. at pumping station, Durnsford-road, to view the pumping plant, lime mixing plant, filters and sludge pressing plant, the atomisation of sewage devised by the borough engineer (Mr. C. H. Cooper, M.INST.C.E.), and the recovery of fats resulting from such treatment. Afterwards an inspection will be made of the S.O.S. works, and the products resulting from the destructive distillation of sewage sludge.

INSTITUTION OF MUNICIPAL ENGINEERS.

EASTERN, NORTH-EASTERN AND SOUTH-EASTERN DISTRICTS.

A meeting of these districts will be held at Dunstable on Saturday, May 29th.

PROGRAMME.

1.30 p.m.—Reception at the town hall.

2 p.m.—Leave town hall by conveyance. (Approximate cost of conveyance, 1s. 6d. per head.)

2.15 p.m.—Arrive at sewage disposal works.

3 p.m.—Leave sewage disposal works.

3.10 p.m.—Arrive at gasworks.

3.30 p.m.—Leave gasworks, and proceed on foot to Maiden Bower (old British camp), onward by Green Way (old British road) to Totternhoe Knolls (old British and Roman camps). Inspect cottages erected by the Luton Rural District Council at Totternhoe.

4.30 p.m.—Proceed by conveyance to waterworks, &c.

5.20 p.m.—Tea at Dunstable (by kind invitation).

Descriptive notes on the various undertakings and inspections will be given by Mr. W. F. Wilkins, borough surveyor, Dunstable, and Mr. H. Pickering, surveyor, Luton Rural District Council.

Trains leave Luton (G.N.R., adjoining M.R. Station) for Dunstable at 12.20, 1.5 and 1.30, and Leighton Buzzard (L. & N.W.R.) for Dunstable at 12.25.

Trains leave Dunstable for Luton at 6.15 and 7.25, and for Leighton Buzzard at 6.5 and 8.13.

G. BELSON CHILVERS,
Hon. District Secretary.

Oundle, Northants.

COUNCIL MEETING.

The next meeting of the council will be held in London on Wednesday, May 26th, at 5.30.

B. WYAND,
Secretary.

39 Victoria-street,

APPOINTMENTS VACANT.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* WEDNESDAYS *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

BOROUGH SURVEYOR.—May 15th.—Newport (I.W.) Town Council. £225—£250 per annum.—Mr. T. Ross Pratt, town clerk.

SANITARY INSPECTOR.—May 18th.—Hayfield Rural District Council. £60 per annum.—Mr. J. R. Bowden, clerk, 16 High-street, New Mills.

INSPECTOR OF NUISANCES AND SURVEYOR.—May 18th.—Todmorden Rural District Council. £104 per annum.—Mr. F. Hollinrake, clerk, Union Offices, Todmorden.

SEWAGE WORKS MANAGER.—May 20th.—Hanwell Urban District Council. £2 per week, with house.—Mr. S. W. Barnes, surveyor.

FEMALE HEALTH VISITOR.—May 21st.—Mitcham Urban District Council. £100 per annum.—Mr. Robert M. Chart, clerk, pro tem.

SANITARY INSPECTOR.—May 21st.—Mitcham Urban District Council. £200.—Mr. Robert M. Chart, clerk, pro tem.

ROAD FOREMAN.—May 21st.—Mitcham Urban District Council. £2 per week.—Mr. Robert M. Chart, clerk, pro tem.

SURVEYOR.—May 21st.—Mitcham Urban District Council. £250—£300.—Mr. Robert M. Chart, clerk, pro tem.

CLERK TO COUNCIL.—May 21st.—Mitcham Urban District Council. £250—£300.—Mr. Robert M. Chart, clerk, pro tem.

CLERK'S ASSISTANT.—May 21st.—Mitcham Urban District Council. £120—£150.—Mr. Robert M. Chart, clerk, pro tem.

SURVEYOR.—May 31st.—Llanfrechfa Urban District Council. £146 per annum.—Mr. William Clark, clerk, 44 Coronation-road, Cwmbran, near Newport, Mon.

CLERK OF WORKS.—Tyldesley Urban District Council. £2 10s. per week.—Mr. Francis E. Jones, engineer and surveyor, Council Offices, Tyldesley.

ASSISTANT ENGINEERS.—Public Works Department, Government of the Gold Coast. £350—£400 a year, with furnished quarters.—Crown Agents for the Colonies, Whitehall-gardens, London, S.W.

ENGINEER.—Public Works Department, British Guiana. £300—£400.—Crown Agents for the Colonies, Whitehall-gardens, S.W.

ENGINEERING AND SURVEYING ASSISTANT.—Derbyshire County Council. £150 per annum.—County Surveyor, County Offices, Derby

CEMENT INSPECTOR.—Federated Malay States.—Crown Agents for the Colonies, Whitehall-gardens, London, S.W.

MUNICIPAL CONTRACTS OPEN.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* WEDNESDAYS *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

Buildings.

LEEDS.—May 17th.—For the construction of three underground transformer chambers, for the corporation.—1, Whitehall-road, Leeds.

WITHERNSEA.—May 18th.—For the erection of a reinforced-concrete wall, for the urban district council.—Mr. J. H. B. Kirton, engineer.

DERWENT.—May 18th.—For the erection of a stable and coach-house at the small-pox hospital, for the Joint Small-pox Hospital Board.—Mr. H. B. Williams, architect, Town Hall, Workington.

MANCHESTER.—May 18th.—For additions to laundry and accumulator house, for the Sanitary Committee.—City Architect, Town Hall.

GLAMORGAN.—May 19th.—For additions and other works at certain schools, for the county council.—County Hall, Cardiff.

DARLINGTON.—May 20th.—For the erection of a brick chimney 128 ft. high, for the corporation.—Mr. G. Winter, borough surveyor.

CAERPHILLY.—May 22nd.—For the construction of a concrete retaining wall, for the urban district council.—Mr. Alfred O. Harpur, surveyor.

CHORLEY.—May 25th.—For alterations to the discharge block and painting, for the Chorley Joint Hospital Board.—Mr. R. E. Stanton, clerk.

ISLE OF WIGHT.—May 26th.—For repairs and other work to a bridge, for the rural district council.—Mr. L. A. Cozens, surveyor, Walmer Villa, Castle-road, Newport, I.W.

SHEFFIELD.—May 28th.—For excavations and concrete work, for the Electric Supply Committee.—Mr. S. E. Fedden, engineer and general manager, Commercial-street, Sheffield.

CANNOCK.—May 28th.—For the construction of conveniences, for the urban district council.—Mr. R. Blanchard, engineer.

HASTINGS.—May 31st.—For the erection of band-stand and covered shelters, for the corporation.—Mr. P. H. Palmer, borough engineer.

GRIMSBY.—June 5th.—For alterations to "Rutland House," for the rural district council.—Mr. J. F. Wintringham, St. Mary's Chambers, Grimsby.

WEYMOUTH.—For the erection of 100 working-class houses, for the corporation.—Mr. W. R. Wallis, town clerk.

Iron and Steel.

SALFORD.—May 19th.—For the supply of welded steel main, for the Gas Committee.—Mr. W. W. Woodward, engineer, Gas Offices, Bloom-street, Salford.

DARLINGTON.—May 20th.—For the supply and laying of cast-iron condenser water pipes, for the corporation.—Borough Electrical Engineer, Haughton-[illegible], Darlington.

Roads.

MONMOUTH.—May 17th.—For the supply of materials, or for hauling stone for the repair of the main roads, for the county council.—Mr. W. Tanner, county surveyor, County Offices, Newport, Mon.

HOLYWOOD.—May 17th.—For the supply of stones for carriageways and footpaths, for the urban district council.—The Surveyor.

RUNCORN.—May 17th.—For the supply of granite macadam, setts, kerbs, and sanitary pipes, for the rural district council.—Mr. W. E. Hough, acting clerk.

The Surveyor

And Municipal and County Engineer.

Vol. XLVII. MAY 21, 1915. No. 1,218.

Minutes of Proceedings.

The Economy of Testing.

There are certain bed-rock truths which have been established by experience and the test of time. It would be very foolish to proceed in a contrary direction unless one courted disaster, or at least a partial failure. It is not always a question of the use of the right materials, but of their quantity and quality. A ton of clean ballast and a hundredweight of cement will not make a good floor any more than dirty sand and poor lime will make a good ceiling. It is evident, therefore, that there must be great economy in following the results gained by testing. By testing one gets to *know*, and the accumulation of this knowledge allows of the carrying out of work on right and safe lines. It is known, for instance, that the design of a certain pipe for a certain purpose under certain conditions should be of such a material and of such a strength, because past experience has taught that it should be so; but a further test is required. The pipe may hold up to all the proper dimensions, and may look very good, but it is necessary that it should also be tested in its working position. In a recent case iron water pipes were cast and tested at a foundry under the supervision of an inspector. The pipes were struck with a hammer in all their parts while under pressure, and test bars of the metal actually used were also carefully proved. Subsequently the pipes when laid were tested in the trenches by hydrostatic pressure to 50 lb. per square inch above the working pressure, the result being that 460 10-in., 89 6-in., 97 4-in., 10 2-in. pipes, weighing about 141 tons, or over 8 per cent of the total weight delivered, were rejected. Can anyone but a town surveyor realise what it would have meant to have lived in that town had the final test not been carried out before the system came into work? Rule of thumb, or "having a shot at it," may be an easy way of taking up responsibility, but it is not usually economical. As one cannot take the cover off the earth and see the conditions below, it behoves us to use the boring tool or the sunk shaft to ascertain as much as we can. It has been said that 70 to 80 per cent of failures of works subject to earth pressure are those constructed in clay, and most of the reservoir dams which have failed have been through the movement of the clay foundations. We may be sure that had such clay been known to be treacherous it would not have been relied upon. Settlements and other mishaps frequently occur from buildings being erected on unknown foundations, which such happenings would be prevented if adequate investigation and trial had been previously made of the ground. The extra careful rule-of-thumb man may, on the other hand, cause great waste of materials by ignorantly overdoing the necessary margin. Knowledge [illegible] to a great saving in expenditure, allowing as it does a large enough—but not too large—margin of safety.

A dictum of Carlyle's is matter in the wrong place, which in many instances would be a good definition of waste too—a waste caused by the use of unsuitable materials. Failures in road surfacing, failures in roof covers, failures in wall painting, and the rest, are evidences of the lack of testing or experience. The good soldier is the man of tested qualities, upon whom his General may rely. It is economical to employ such a man [illegible] is worth many untrained, untested, raw recruits. It is the same in the engineering sphere—we shall be best served by using materials that have stood the test—bricks from the good brickyard, granite from the good quarry, pipes from the good foundry. There is no economy in using bricks which are affected by frost, or granite that pulverises under the steam roller, or pipes that burst under working pressure, because they may be cheap to buy. How are we to be sure of the quality of our materials? Only by testing, either carried out by ourselves or by others upon whom we may rely. How often the engineer and surveyor sighs for an expert opinion on some material which he would like to use, but which he has had no opportunity of testing himself! He dare not risk it on the recommendation of the interested purveyor, although the merits claimed for it in the lurid leaflet may be quite correct. Where a material or system has been thoroughly tested by a careful, disinterested investigator, it would be most valuable if the result could be scheduled in some permanent way for the use of official engineers—in which case the length of the visits of various commercial travellers would be much curtailed. Then a reference to the suggested schedule concerning some material or process for which every excellence was claimed—would show the opinion of the expert investigator, and the reliable words "unsatisfactory," "inferior," "not reliable," "good," "excellent," as the case might be, would lead to a great saving in time and trouble, to say nothing of future heartburning. It may be contended that the technical Press does at the present

time print a good deal of information on these lines. That is so; but it is not in the province of that Press to do what is needed, especially in the matter of protected articles. Life is short, and it seems a pity for knowledge acquired through laborious hours to be lost, and for man after man to tumble into mistakes which could be avoided by a reference to a book of duly recorded investigations or observations. Just as the tradesman finds it economical to test the suspiciously new-looking florin that may be tendered to him, so the engineer would find it economical to test the new materials as well as the old that may be offered for municipal consumption.

* * *

Back-to-Back Houses.

Not the least important of the changes effected by the Housing, Town Planning, &c., Act, 1909, was the prohibition of the erection of back-to-back houses. It will be remembered that the Act provides in terms that, notwithstanding anything in any local Act or by-law in force in any borough or district, it shall not be lawful to erect any back-to-back houses intended to be used as dwellings for the working classes, and any such house commenced to be erected after the passing of the Act is to be deemed unfit for human habitation for the purposes of the provisions of the Housing Acts. In other words, if any new back-to-back houses are erected, it at once becomes the duty of the local authority to make closing orders. The evils attendant upon this form of construction were very widely recognised for some years before the passing of the Act, and although, if our memory serves us, there were some eminent sanitarians who were prepared to defend this type of house as being quite healthy and fit for occupation, the general opinion was that their continuance was undesirable on grounds of public health. This opinion, however, referred to that type of house, well known in certain localities, in which two rows of houses having the whole of their backs contiguous are built in a common court, and there can be no doubt that the prohibition in the Act of 1909 was directed, primarily at all events, against this form of construction. The statute, however, contains no definition of the expression "back-to-back" houses, an omission which gave rise to an interesting discussion in the Courts last week as to the precise significance of the term.

It appears that the late Sir Edward White, having obtained a lease of a mews from Lord Portman, pulled down the old building and erected a block of ten garages with living rooms over. This new building consisted of one entire block of two floors, divided by four transverse party walls into five separate premises. On the ground floor the premises were divided into ten garages arranged in five pairs, each pair being divided by a half brick partition in which was a door, screwed up. On the first floor were ten dwelling-houses, arranged and divided into five pairs corresponding to the garages below. The dwelling-houses in each pair were separated partly by a lath-and-plaster partition, and partly by a ventilating shaft or area, into which opened a window from each of the back rooms. In the whole building there were five such shafts or areas, each being about 6 ft. long by 5 ft. wide. A curious feature of the case was that the building was apparently in accordance with the London Building Acts, having been passed by the district surveyor of the London County Council. The Marylebone Borough Council, however, were advised that, in spite of the presence of the ventilating shafts, the houses were "back-to-back" within the meaning of the Act, and they accordingly made closing orders. Against those orders an appeal was made to the Local Government Board, and that body, after holding a public local inquiry, stated a case for the opinion of the High Court.

The first question upon which the opinion of the Court was sought was whether the dwelling-houses were back-to-back houses within the meaning of the Act. For the appellant it was contended that the prohibition only applied to the well-known and ordinary type of back-to-back houses, and that it was designed to secure through ventilation—an object which was achieved in this case by the presence of the ventilating shafts. The respondent council, on the other hand, argued that, in the absence of any statutory definition, the expression "back-to-back houses" must be construed according to its popular and ordinary meaning, and so as to include all houses so built that their backs actually adjoin. In the result, the Court refused to say whether or no these houses were "back-to-back," holding that this was a question of fact which the Local Government Board must decide for themselves. They were unanimously of opinion, however, that it was open to the board to find as a fact that the houses were back to back if on the evidence they were satisfied that they were substantially within that description, and Mr. Justice Avory further observed that in his opinion the presence of the ventilating shafts did not prevent the houses from being back-to-back houses. A second question was also submitted to the Court—namely, whether the dwelling-houses were intended to be used as dwelling houses for the working classes. It was admitted that they were intended for occupation by private chauffeurs, and, in the absence of a statutory definition applicable to these provisions, the Court intimated that the board could find that these persons were included in the term "working classes" for the purposes of the case.

Town Planning Problems.

On Friday last the members of the Town Planning Institute were privileged to hear a second address by Mr. Thomas H. Mawson, HON.A.R.I.B.A., on "Some of the Larger Problems of Town Planning." In his former lecture, which was reproduced in our issue of March 19th last, Mr. Mawson emphasised the importance of what he called the strategic factor in fixing the location of a city, or in guiding its development upon the most advantageous lines. The principle to be borne in mind is that the life of a town must depend very largely upon the freedom with which its raw materials can be delivered and the finished or manufactured or mineral products of the district despatched. Among the many illustrations given by the lecturer, perhaps the most interesting was that of Port Sunlight, the strategic position of which was said to be perfect. Of the remaining "larger problems" dealt with, the first place was given to the provision of cheap power, which was followed by a discussion of traffic problems. This is, of course, a matter of the first importance, traffic being the very life-blood of a city. The problem of the town planner is so to plan his traffic streets that they exactly follow the lines of the bulk of the traffic which is to occupy them. For this purpose Mr. Mawson advocated a main division of all traffic into radial and gyratory, and pointed out that in the average city at least three-quarters of the wheeled traffic proceeds in a radial direction—that is either to or from the centre of the city. Finally, the lecturer dealt with the question of co-operation and collaboration between the various men who are concerned with city planning.

The need for co-operation is admitted, but the question remains how it may best be brought about. It was at one time necessary for municipal engineers to speak very frankly as to their

interest in and qualities of all the work, and to have always maintained that their knowledge and experience qualified them admirably to deal with the problems which arise. Mr. Macnamara's comment led him to the conclusion that there must be some peculiar virtue attaching to the name of a specialist, but it is that general training which will place him in sympathy with all the problems employed to execute the judicial duties, to coordinate and correlate the work of each, and to see that every interest is adequately [illegible] that the training of the municipal engineer [illegible] cannot be planning to be carried out in most cases under the general supervision, but with the advice and co-operation of such expert consultants as may be deemed necessary, having regard to the nature and extent of the scheme in hand?

The Rating of Sewers.

The committee of county councillors, and those sitting under the auspices of the Local Government Board, have recently had the question of the rating of sewers under consideration, and the authorities of London, Liverpool, and Glasgow have been invited to meet the question as well within the region of practical realities. To the layman it would appear that the simplest way is not subject to rating, the sewer, which forms part of it, would be in the same category. The cost of sewer maintenance is met by the assessment of property, and ergo it might be argued that to charge the sewers with a special rating is virtually to impose an additional assessment of questionable equity. What would seem to lend force to this line of argument is the fact that only a proportion of sewers, in some districts a relatively small one, are subject to rating, and that it is in many instances almost nominal in amount. In the circumstances, the Association of Municipal Corporations last year drafted a Bill to exempt underground sewers from rating, but the intervention of the war has held it up for the time being. The operative clause is in the following terms: "No sewer vested in a local authority which is situate below the surface of the ground, and where any sewer vested in a local authority is situate partly above and partly below the surface of the ground, no part thereof which is situate below such surface shall be assessed to any rate for the time being levied in the parish, district, borough, county or other area in which such sewer or part thereof is situate, and no rate shall be payable in respect of such sewer or such part thereof." Considerable opposition was offered to this clause, on the ground chiefly that the exemption which it contemplated was too comprehensive, including as it does joint sewerage boards and other such bodies, to whom payments are made for the use of their sewers. The association have met these objections by an amendment of the draft Bill excluding joint boards and other bodies. There the matter rests for the present, and there it will probably remain until the prospects of this class of legislation become more hopeful. The position of the law is certainly unsatisfactory, and the case for amendment is powerful, if not unanswerable.

* * *

Flies and Disease.

A further indication of the interest which has been aroused in the subject of the transmission of disease by flies was forthcoming a few days ago in the House of Commons, when the President of the Local Government Board was interrogated by Mr. Boland. The question was more immediately concerned with the steps to be taken to inform the public as to the danger to health which would be involved in a plague of flies under existing war conditions, and the reply was perfectly satisfactory in that it showed that the importance of the matter is thoroughly appreciated by the Local Government Board. The [illegible] reports on Flies as Carriers of Infection to which Mr. Samuel referred were noticed in these columns as they appeared, so that our readers [illegible] kept informed as to the progress of the latest scientific investigations. It is satisfactory to observe that a further circular letter is to be issued, because public opinion can only be educated by a constant repetition of plain if unpleasant fact that the common house fly finds its most productive breeding place in damp and filthy accumulations of offensive refuse. Many local authorities have already issued posters and leaflets on the subject, and if the Local Government Board were to issue some model leaflets for this purpose—a matter which they have under consideration—there can be no doubt that many more authorities would follow suit. If, as was suggested, a committee is appointed to deal with the subject, it is to be hoped that definite action will not be unduly delayed, for the need for action is [illegible]

Engineers and the War.

In the House of Commons recently several interesting questions were addressed to Mr. Wadsworth to the Parliamentary Secretary to the Admiralty and the Under-Secretary of State for War, with a view to ascertaining to what extent the services of civil engineers are being used by those departments. The form of the questions was rather complicated, and the answers were in the official manner, but one point at least which is of more than passing interest was raised. How many professional engineers are serving in the ranks, and their experience of labour and knowledge of materials thus lost to the nation? The war has been fairly described as a war of engineering, and if the forces of the country are to be organised to the best advantage, ordinary economy demands that engineering ability shall not be wasted by allowing qualified engineers to fight in the ranks. The patriotism of those who are voluntarily doing so is, of course, beyond all praise, and we do not wish to criticise unduly the form of organisation which permits them to render such service. The air is full, however, of rumours of a more thorough and efficient organisation of all the resources of the country, so as to insure as speedy a victory as possible, and we merely desire to suggest that in any new system which may be set up points of the kind we have mentioned shall be kept steadily in view.

* * *

Notts County Surveyorship.

A complaint in regard to the procedure adopted by the Notts County Council in connection with the appointment of a successor to their late county surveyor, Mr. E. Purnell Hooley, has reached us from a correspondent. After twice advertising the vacancy and receiving some 200 applications, the council, it will be recollected, appointed Mr. Haller, the deputy county surveyor, to fill the post. Mr. Haller may have been—and probably was—the best candidate, and is to be congratulated on his success, but we cannot help sharing the surprise of our correspondent that, if the very man for the appointment was on the premises, the council should have been unaware of his presence. Quite apart from the inconvenience and disappointment caused to a large body of unoffending men, a quite needless expense would seem to have been entailed in bringing selected candidates from various parts of the country to appear before the committee dealing with the appointment.

Sewage-Treatment Experiments with Aeration and Activated Sludge.*

By EDWARD BARTOW and F. W. MOHLMAN, Director and Assistant Chemist respectively, State Water Survey, of Illinois University.

Experiments on the purification of sewage by aeration in the presence of activated sludge were begun a few months ago in the laboratory of the Illinois State Water Survey at the University of Illinois. With the advice of Prof. G. J. Fowler, of the University of Manchester, England, the experiments are following the lines described by Ardern and Lockett.

Our first experiments were made in bottles of 3-gallon capacity. Later we constructed a tank 9 in. square and 5 ft. deep, with plate-glass at the front and at the back. A porous plate was placed 4 in. above the bottom. An inlet for air and an outlet for any water which might pass through the plate were provided in the space below the plate. Compressed air furnished by the university power plant is used. All air is measured through an ordinary gas meter. The purified sewage is removed by means of a syphon. Experiments have been carried out in the laboratory at room temperature, thus far, with no special precautions to regulate the temperature.

For our experiments fresh sewage collected from the Champaign main sewer is used. It is a fairly strong domestic sewage, with no trade wastes.

AERATION OF RAW SEWAGE WITHOUT THE ADDITION OF SLUDGE.

Air has been blown into five separate portions of sewage until complete nitrification was accomplished, which has taken from fifteen to thirty-three days. The best result was obtained in the tank, where the air was distributed through the porous plate. For all analyses samples of the supernatant liquid were taken after one hour settling without filtration. In each case the free ammonia nitrogen was almost quantitatively changed to nitrite nitrogen, then the nitrite nitrogen in turn was changed almost quantitatively to nitrate nitrogen. (See Parts I. and II. of table.)

* The remaining figures in this column are for hours instead of days.

The formation of nitrate in the tank was accomplished in fifteen days with the use of 4,830 cub. ft. of air.

AERATION WITH SLUDGE.

The supernatant liquid was syphoned off and a fresh portion of sewage added to the sludge. In this, the second treatment, the effect of a small amount of sludge is nicely illustrated by the reduction of the time required for complete nitrification from fifteen days to four days, and the reduction in the amount of air used from 4,830 cub. ft. to 1,270 cub. ft. Thirty-four parts per 1,000,000 of free ammonia nitrogen in the raw sewage produced 23·8 parts per 1,000,000 of nitrate nitrogen in the supernatant liquid.

The supernatant liquid was again syphoned off, fresh sewage added and aëration continued. In this, the third treatment, nitrification was complete in two days, and but 720 cub. ft. of air was used. Thirty-three parts per 1,000,000 free ammonia nitrogen produced 22·3 of nitrate nitrogen. In the twelfth treatment the purification was completed in less than eight hours with the use of less than 128 cub. ft. of air, and 36 parts per 1,000,000 as free ammonia nitrogen produced 29·5 parts per 1,000,000 of nitrate nitrogen. In the thirty-first treatment, with sludge and sewage in the proportion of 1 to 5, purification was complete in less than five hours, using 35 cub. ft. of air. This is equal to 0·20 cub. ft. per square foot of surface area per minute, or about 3 cub. ft. per gallon of sewage. We have not yet attempted to determine the minimum amount of air required.

Samples taken at the end of each hour of aëration during some of the treatments have been tested for stability. A sample taken at the end of one hour aëration in the thirty-first treatment had not decolorised methylene blue at the end of twelve days. Since in one hour nitrification was not complete, it is therefore evidently unnecessary to obtain complete nitrification in order to obtain a stable effluent.

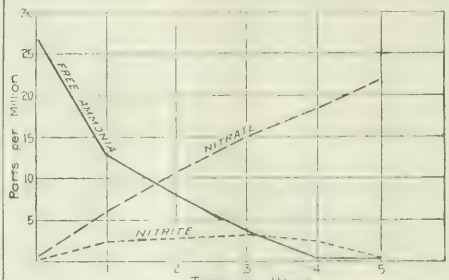

FIG. 1. SEWAGE NITRIFICATION WITH ACTIVATED SLUDGE PRESENT.

(Supplied by the Illinois State Water Survey.)

The progress of nitrification in the presence of activated sludge is apparent. (See Part III. of table, also Fig. 1.) Analyses indicate that there is no quantitative conversion of free ammonia to nitrite, followed by oxidation to nitrate, but that nitrates are formed simultaneously with nitrites.

The number of bacteria was determined during one treatment. Samples were taken after one hour settling. The raw sewage showed a bacterial content of 750,000 per cubic centimetre. The supernatant liquid, after aëration and settling one hour, showed but 20,000.

Through the courtesy of Frank Smith, Professor of Systematic Zoology, University of Illinois, biological examinations have been made of the sludge. Among the microscopic animals found are rotifers (*Vorticella* and *Philodina*), but the predominating organism is an annelid worm, known as *Aeolosoma hemprichi*. This organism is about 2 to 5 millimetres long and quite slender. It abounds in various kinds of fresh-water bodies where there is an abundance of decaying organic material, and thrives especially well where there is much fermentation and in waters contaminated with sewage, provided there is an abundance of oxygen.

It belongs to a group of worms in which reproduction occurs very rapidly by asexual methods. A fission zone is formed near the middle of the body of the parent worm and develops the head of one daughter worm and the tail of the other, and thus two new worms are formed from one. This requires not over two or three days, and is repeated for an indefinite number of generations.

* Abstract of a paper read before the American Chemical Society at New Orleans on April 1st, and is produced from *Engineering News*.

[illegible] presumably destroy at least their own weight of organic matter every day, and probably more. Because of the mode of reproduction, it takes but a short time to produce extensive colonies with great capacity for the destruction of organic material.

SLUDGE.

The activated sludge has evidently been developed by the multiplication of these worms originally present in the sewage, and the species found at varying points might differ. The sludge does not have an unpleasant odour, owing to the fact that it consists largely of living organisms. If kept for a long [illegible]

COMPOSITION OF SLUDGE.

Analyses of the sludge made by W. D. Hall have shown the following results: After drying first on the water bath and then for three hours in an oven at 100 deg. Cent., the loss, or moisture, was 95·54 per cent. The dried material contained 6·3 per cent. [illegible] phosphoric acid (P2O5) and 2·0 per cent. potash (K2O), equal to 5·31 per cent. P2O5 and 2·4 per cent. K2O. The volatile matter by loss on ignition.

From these chemical data the dried sludge would evidently have value as a fertiliser. If we calculate the value at 20s. per unit [illegible] of phosphoric acid and potash, we get a total value of 20s. per ton.

SOMERSET SURVEYORS' ASSOCIATION.

MEETING AT GLASTONBURY.

A meeting of the Somerset Surveyors' Association was held in the Town Hall, Glastonbury, on Saturday afternoon last.

The members were received by the Worshipful the Mayor of Glastonbury, the attendance including Messrs. F. W. Jones, ASSOC.M.INST.C.E., Frome Urban District Council (president), J. Ace Beynon, Frome Rural District Council (vice-president), G. and H. N. Alves (Glastonbury), L. Caplen (Yeovil), T. G. Crump (Taunton), H. Cousins (Street), R. S. Davey (Clutton), C. Durie (Williton), W. E. Groves (Dulverton), C. Harding (Williton), D. Hinchcliffe (Shepton Mallet), E. T. Howard (Wellington), E. H. Knapman (Wincanton), R. J. Nichols (county surveyor's office), T. Orchard (Clutton), S. S. Orchard (Taunton), F. Parr, ASSOC.M.INST.C.E. (Bridgwater), C. Pursey (Wells), J. T. Robinson (county surveyor's office), Edward Stead, ASSOC.M.INST.C.E. (county surveyor), and Mr. D. Edwards, ASSOC.M.INST.C.E. (Taunton), honorary secretary.

In opening the meeting, the MAYOR said he had very much pleasure in welcoming the members to Glastonbury. He remarked that the sewerage scheme had been a very difficult procedure from the beginning, owing to the peat. He was very sorry he was unable to accompany the members round the works owing to particular business, but no doubt Mr. Alves would interest the members in the works.

The PRESIDENT said it gave him much pleasure to thank his Worship on behalf of the association for the very kind reception he had given them. He was quite sure that the meeting would be of benefit to the members, and that the inspection of the works that had been carried out would prove very instructive. These were the kind of works they liked to visit—works that had been difficult; from such works they learned a good deal.

The SECRETARY read the minutes of the previous meeting, which were adopted and signed as correct.

The PRESIDENT moved a vote of condolence with the family of the late Mr. W. A. Collins, surveyor to the Bridgwater Rural District Council, whose death was announced in last week's SURVEYOR. He could not say how extremely grieved he was to hear of the sad loss that the association had sustained. Mr. Collins was a leading member of this association, and he was the prime mover in its inauguration. He was the first secretary, and later became president.

The motion was passed in silence, the members upstanding.

Letters of apology for non-attendance were received from Messrs. Johnson (Keynsham), E. J. H. Padfield (Wincanton), Reg. Stephens (Chard), and Knowles (Clevedon).

The PRESIDENT stated that, as the members were aware, under the association's scheme a premium was given annually by Mr. Stead, the county surveyor. Mr. Stead [illegible] connection with it and wished it to be called the "Telford" premium, which he (the president) thought was a very excellent name for it. The premium treated of work that they were all connected with, and he hoped it would appeal to the members of the association, and that they would let them have a score of papers in competition for it. The rules were very clear and everything was quite straightforward, so that they would have no difficulty in following the thing through. There was a premium of two guineas and another offered by Mr. Parr of half a guinea, which the latter wished to be competed for by the younger members of the association, and which is a standing premium from year to year. They very much hoped they would get a greater number of papers than in the past year.

The [illegible] which any of the members at any time in the ordinary course of their duties might meet with, and he thought it would be very helpful to everybody if the scheme was energetically taken up. In addition to having the competition itself, they would have the value of criticisms which would be offered at the annual general meeting. He appealed to them all, especially the younger members, to assist in this matter.

Mr. C. Harding, assistant surveyor to the Williton Rural District Council, was elected a member of the association, and Mr. H. N. Alves was transferred from [illegible]

At this point the PRESIDENT referred to a paper on [illegible] Mr. H. N. Alves, and the members were invited to [illegible] Bridge, the pumping station and tanks at Porcheshall, and thence proceed to the sewage disposal works. Mr. Alves' paper appears elsewhere in this issue.

Mr. A. P. I. COTTERELL, M.INST.C.E., the engineer of the sewage scheme, met the members at Northload, and accompanied them round the various works, giving a brief *résumé* of the various difficulties that were met with and overcome during the operations.

The PRESIDENT moved a hearty vote of thanks to Mr. Cotterell for so kindly explaining the extremely interesting works, and complimented him upon the ingenious way he had got over exceptional difficulties. This was seconded by Mr. CRUMP, and carried unanimously.

Mr. COTTERELL responded, and remarked that Mr. H. N. Alves had been most efficient, and that a lot was due to him for the success of the works.

At the invitation of Mr. G. Alves, the members returned to Glastonbury for tea, after which there was an interesting discussion in which Messrs. G. and H. N. Alves, H. Cousins, F. W. Jones, F. Parr, D. Hinchcliffe and C. Pursey took part.

A hearty vote of thanks to Mr. Alves for his very excellent paper and for the useful information he had given in answer to the various questions put to him, was moved by the PRESIDENT. This was seconded by Mr. H. COUSINS, and carried unanimously.

A hearty vote of thanks to Mr. G. Alves for his great kindness in providing the members with tea was proposed by Mr. J. A. BEYNON, and seconded by Mr. F. PARR, and Mr. D. EDWARDS proposed a vote of thanks to Mrs. H. N. Alves and Miss Alves for their assistance in providing and dispensing the tea.

Surveyors' Institution. The annual general meeting of the institution, to receive the report of the council and the announcement of the result of the election of officers for the ensuing year, will be held in the lecture hall on Monday, May 31st, at 5 o'clock. The prizes awarded to successful candidates in connection with the recent preliminary and professional examinations will be presented by the president.

Hotel Water Supplies.—The latest and largest hotel to cater for the comfort of London's myriad visitors is the Regent Palace Hotel, which occupies a huge island site a dozen yards from Regent-street, behind the County Fire Office and the Café Royal. The hotel, which is the largest in Europe, has over a thousand bedrooms, each bedroom being supplied with hot and cold water, and guests are offered the luxury of a soft-water supply—the softening installation being carried out by Messrs. [illegible] the well-known Danish firm, who have made water purification their speciality. The kitchens, boiler-house, and heating system are also supplied exclusively with soft water from a separate Lassen-Hjort installation placed in the basement.

Some of the Larger Problems of Town Planning.

By THOMAS H. MAWSON, HON.A.R.I.B.A.

[Lecture delivered before the Town Planning Institute on Friday last, being the continuation of one reproduced in "THE SURVEYOR" of March 19th last.]

In rising to address you for the second time on some of the larger aspects of town planning, I would first of all say that, not only has it given me very great personal pleasure to find that the subject has created sufficient interest to warrant this second meeting, but I feel that, for several reasons, it is most fortunate that we are able to hold it. I suppose that almost everyone here has, at some time or other, either spoken or written on some aspect of town planning, and I am quite sure that all who have done so will have felt the impossibility of dealing at all adequately, even with one small aspect of this great subject, within the space of one lecture or one article, and has been tempted, as I have almost been tempted, to feel that it was so entirely impossible to do justice to the subject under such conditions that we had better not try at all for fear our efforts should simply result in creating confusion of mind as to exactly what the aims and objects of our profession were, and so we might rather tend to hinder than to further the interests which we have so much at heart.

Another reason for taking up this subject again is its extreme importance. Unless we decide first of all what are the broad principles for which we contend, and when we have decided what they are we realise exactly how they are to be attained, all our efforts will be lost in a muddle of small aims and undecided purposes. I would even go so far as to say that, so far, in the town planning movement in this country, this confusion of aims has been more or less paramount, with the result that, to the outsider who sees "most of the fun," we as a body have appeared rather as a set of cranks with "hobbies to ride," who have allowed our discretion to over-ride our prudence, and who imagine that, by doctoring one small sore which has come under our immediate observation in the body politic, we can heal all the ills to which the organism as a whole is subject. No one can deny that the town planning movement in this country is looked upon by many people with the smile of amused contempt, as something quite outside the range of practical politics and hardly worth a serious man's attention, and when we compare this attitude of mind with that prevailing in other countries where the movement is viewed as one with a great future before it, it behoves us to look for the cause and not to rest until we find it. I do not say that the cause which I have indicated is the only one, but I am sure you will agree that it is the largest, and that the only mistake which critics of the movement make is in supposing that all town planners are cranks with "hobbies to ride," whereas they are merely misguided people who are mistaking one specialised line of action along which town planning can move for the great root principle on which it should stand.

My object in these lectures is to show what some of these great root principles should be, and last time I addressed you we dealt with one of these which is so important that it seemed better to devote the whole of our time to its consideration rather than to leave it before I had made myself perfectly clear as to exactly what it is and its relation to the subject as a whole.

THE STRATEGIC FACTOR.

Before turning to consider other root principles, perhaps it would be wise very shortly to recapitulate the conclusions which I sought to arrive at in connection with this portion of the subject. Not only in my lecture, but also in the discussion which followed, I endeavoured to maintain that the location of all cities is first of all strategic, and, as you will remember, I instanced Manchester as an ideal distributing centre, Liverpool as a shipping port, and London as a governmental centre, Oxford and Cambridge, and especially the latter, as originally strategically perfect academic centres. Nature first provided the ideal condition, and science and art have contributed to give these natural advantages their economic value.

I further pointed out that, in speaking of the strategic factor, I did not in any sense intend to confine that expression to its military sense. With this end in view, I pointed out the different, yet equally strategic, locations of our Lancashire cotton manufacturing towns, which are dependent upon a humid atmosphere and ample supply of good water for the development of their industries, necessities which cannot be found in such perfection in any other part of the world, if we except Ireland, which shares with this district the peculiar advantages given to it by the presence of the humid strata of air overlying the Gulf Stream.

You may further remember that I emphasised what I had said with regard to the strategic placing of such towns by some figures relating to Lancaster and to Preston, which, as you know, lie about 30 miles apart on the London and North-Western Railway main line to Scotland, and I showed how the former town suffered from its weak strategic position in relation to the latter in having to pay about £30,000 per annum over and above what is paid by Preston for the same amount of heavy goods traffic. Including parcels and passenger charges, Lancaster is probably penalised to the extent of at least £50,000 per annum, which is equal to a rate of 5s. 6d. in the £.

This one statement is sufficient to justify my claim that the strategic factor is the one most important of the broad principles on which town planning must rest, for when collecting data for a town planning scheme we must of necessity, first of all before anything else study the strategic element, which is so largely a geographical one, for the life of the town must depend very largely upon the freedom with which its raw materials can be delivered and the finished or manufactured or mineral products of the district despatched. Here perhaps I may anticipate one obvious objection to what I have just said. In the majority of cases the location of a city is quite beyond the control of the town planner. Even where he is planning *de novo* on a virgin site, that site is fixed for him, and he has no choice but to adopt it; but I still maintain that this does not exonerate him from the necessity of studying most carefully the strategic factors which govern the town. Thus, in the very instance which I have just been quoting, though the position of Lancaster is fixed and unalterable, and though we cannot place it just as near the centres from which it attains its merchandise or to which it sends its finished articles as its neighbour Preston, much has been done to overcome the consequent defect, in this instance, by the provision of splendid transit facilities within the town, whereby nearly every works or manufactory of any standing has its own railway sidings and often its canal communication as well, and as a result largely of this the Lancaster, Kendal and Preston Canal is a pattern of what the water highways of the country ought to be, if properly planned in relation to the towns they serve and built on a generous enough scale.

However, this is a digression. I must now pass on to consider other root principles governing town planning, but before doing so I would just add a statement which I think will surprise some of you, and especially members of that numerous class of town planners who regard the housing of the working classes as the Alpha and the Omega of town planning. This statement is that it is the perfect strategic position of Port Sunlight for the receipt and delivery of goods, and the consequent vast saving effected in the handling of merchandise, which has made the model village possible. It provided the surpluses which my friend Sir William Lever, with his usual insight and foresight, seized and realised, with a result which has made his notable experiment of world-wide reputation.

Turning, then, to others of the larger problems which confront the town planner, I would mention first of all that most important subject—the provision of cheap power—municipally or co-operatively owned, thus effecting a saving not only in its actual working, but also in the hauling of fuel and the housing of a number of smaller plants, probably also doing away

out rely with the smoke-nuisance. The importance of this matter is so universally acknowledged that I need not enlarge upon it, nor need I enlarge on the desirability of a good water supply and the location which will permit of effective and economic sewage disposal by gravitation without any pumping, nor even on the necessity for cheap heat and light, though possibly these two last are ones which have been brought before me more prominently in my practice than they would be before some members here who had not worked in Canada, where natural gas wells up from the soil, and has only to be collected and distributed, and electric power for light is so abundant that street lighting, for instance, can be carried on on such a scale as Ottawa in a manner which would fill the heart of the English town councillor with envious admiration.

TRAFFIC PROBLEMS.

While exercise will realise at once the importance and the interdependence of all these factors, there is one other factor dependent on them, and on which they equally depend, which has far-reaching influence on the success of any town, the importance of which has never, I think, been fully grasped in these experiments of town planning which have been carried out in this country. I refer to the scientific study of traffic problems and traffic control on an economic basis. In most of the work done in this country it would appear from the result that there has been no consciousness of the tremendous need for full consideration of this most important subject, and even where it has been dealt with it would seem as though the paramount idea of the designer were to lure as much traffic into the roads as possible, whereas surely the opposite ought to be the aim. And yet how intensely vital a subject it is, for without traffic the city, town or village cannot live. If we consider the streets, the [illegible] the buildings of a city, comprising its body-corporate, it remains a dead body without its traffic, just as the human body-corporate would be without the life-giving fluid which circulates in its veins. Traffic is to the town what the life-giving fluid is to the body, and only by its aid can it continue to grow and prosper, or even to exist.

I have had this very forcibly brought before me quite recently in connection with my work at Bolton, in Lancashire, where I discovered that the 146 mills and other works had delivered to them in the course of a year, by different railway companies in Bolton, 580,000 tons of merchandise, together with 220,000 tons of minerals and 845,000 tons of coke and coal, making, altogether, the enormous total of 1,645,000 tons of merchandise dragged through the streets. I should add that these figures do not include anything brought into Bolton by road from Manchester or elsewhere, and the heavy motor-car traffic in the town on this account is enormous. It would not be fair to assume that all such traffic could be carried by rail even if proper facilities for landing the goods right at the works were provided. They include only that which is unloaded from the railway and canals in Bolton itself, and which would certainly go straight through to the works if they had the sidings. Nor do these figures include the 300,000 parcels received and sent out from the different stations in Bolton, some of which might also be delivered in the same way under a better railway traffic scheme; nor do they include the still larger amount of traffic handled by numerous business houses in the retail delivery of goods.

Now Bolton is a town of some 300,000 inhabitants, and it will thus be seen that its traffic along its streets is out of all proportion to its size. What would happen, say, to a town like Sheffield under similar circumstances? Such a state of congestion would exist as would render the proper conduct of any business quite impossible; and mentioning Sheffield reminds me that here we have the opposite state of affairs. In this city (one of the seven largest cities in the kingdom), although there is an enormous trade in extremely heavy goods going on the whole time—not only in the day, but throughout the night—I suppose there is no other city where the street traffic problems are so simple, entirely because this one side of the traffic problem—that is, the provision of proper connection between the works and the railway—is adequately dealt with. Sheffield is not, however, a perfect example of the solution of traffic problems, even only in so far as they affect the railway companies and railway facilities. While this heavy goods traffic is splendidly dealt with, the very reverse is the case with the passenger traffic. Neither of the two big stations is really well placed in this respect, though great efforts are at the present time being made, I understand, to bring the Victoria Station more into the heart of things by the creation of a high-level approach over the congested and poor neighbourhood into which the incoming traffic pours at the present time.

We could, of course, spend quite profitably the remainder of our time this evening discussing this one aspect of traffic—that is to say, the planning and arrangement of the railways and their termini and works sidings in the ideal town plan. There are, however, other equally important traffic problems which also claim consideration, and we must pass on to these; but before doing so I would say that the points I want to make in comparing Bolton with Sheffield are, first, that when you have solved your traffic problems you will have no traffic left, and, secondly, that the question of traffic control is essentially an economic one. Supposing, for instance, we take up for a moment again the figures I gave you relative to Bolton, and supposing we reckon the cost of delivery of the merchandise carried through the streets at only 1s. 6d. per ton. This, I am sure, you will agree, would be a very moderate computation indeed, because it barely covers the cost of the actual carting, quite apart from the loading and unloading, and, of course, goods brought from the station to the works by cart are handled three times instead of once. We shall find that at the price I have quoted—that is, 1s. 6d. per ton—we have the enormous cost of £123,375 spent on carting alone, all of which is of a nature which might be avoided, and if we capitalise this on a 5 per cent basis we have nearly £2,500,000 capital, the interest of which is being expended on what is really useless labour. Again, this allows nothing for the extra wear and tear on the highways, so that, if we even spent the whole of this large sum —£2,500,000—in railway sidings, and so on, we should still be enormously in pocket. Put into other terms, Bolton pays equal to a rate of 3s. 5d. in the £ in a rateable value, and this quite apart from maintenance charges for the road

I must, however, pass on

DIVISION OF TRAFFIC.

The most obvious thing to do when taking up the study of the traffic problems of a town is to divide it into radial and gyratory traffic, for, as most of you are aware, the wheeled traffic in almost any town may be divided up into three-quarters of its entire bulk which proceeds in a radial direction, either to or from the centre of the town, and the remaining quarter which gyrates round that centre. This obvious and simple expedient at once brings a semblance of order out of the chaotic mass of vehicles of all kinds which appear to be rushing indiscriminately in all directions, and gives us some hope of bringing the whole down to a scientific basis; for, of course, the aim of the scientific town planner is so to plan his traffic streets that they exactly follow the lines of the bulk of the traffic which is to occupy them. This would all seem very obvious, and I would not have mentioned it but for the fact that I find so very many people who so far fail to realise it that they consider that, for utilitarian purposes, we could have no better plan than the American square block plan, in which every street runs at right-angles to every other, and in conversation with them I have discovered that they considered that, in this respect, there was rather the conflict between æsthetic and practical ideals.

Now here, if there were time, I should like to enter on an intensely interesting argument which I have sustained on more than one occasion to prove that there never can be any conflict between the practical and the æsthetic. In those cases where there appears to be such a conflict it is either because our practice is not truly practical or our æsthetics are false; but all of you, I suppose, will be with me here, and especially those of you who have endeavoured to produce beautiful architecture, not by the addition of superimposed ornament, but by the correct disposition of parts and proportions, so I need only say that what you have found such an engrossing method, and one which promises such exceptional results, is equally applicable to the solution of traffic problems. At first sight this may seem a very bold statement to make, but before you have proceeded far with the study of the subject you will see that those lines which are good for traffic are the graceful lines, that where traffic converges, if the necessary open space is planned with due regard to the division of streams of traffic and the preservation of lines of vision, it will not only lend itself to fine architectural treat-

D*

ment, but will be such as almost to compel such a treatment, and to make its adoption self-evident. . . .

CO-OPERATION AND COLLABORATION.

This brings me to another great principle in town planning, which is so important that it would be absurd to omit all reference to it on an occasion like this, but which, I fear, we have not the time remaining to deal with it at all adequately; this is the great question of co-operation and collaboration between the various men who are to plan the city. I am afraid we do not all realise what ought to be perfectly self-evident, and that is that no one man can, in the space of his natural span of existence, attain to sufficient knowledge of all the many component subjects necessary to allow him to plan a city, from the cutting of the first sod to the choice and selection of the personnel of the municipal brass band. Generally, in this country, it is assumed that each town plan should be the work of one man; but this, really, is absolutely absurd. Between the two extremes I have mentioned, which form the first necessity and the last luxury of city formation, comes a vast agglomeration of specialised efforts which must entail the services of many experts, and it is usually assumed that the final oversight, the last word, must necessarily be placed in the power of one of them. Writing in the *Town Planning Review* some time ago in connection with an article on this very subject, which I wrote for it, Prof. Adshead said: "In England there still exists a great variance of opinion as to which profession most nearly possesses the necessary qualifications. The real issue lies between the architect and the engineer, while surveyors, landscape architects, and sociologists have certainly a voice in the matter." He then went on to suggest a kind of compromise. The surveyor is to have control during the preliminary work, then the engineer is to be in command, and finally the architect is to take possession of the field, and furnish the plan with buildings. This point of view is, I think, a very typical one, which must be my justification for taking it up for criticism.

I cannot but feel that the greatest end of town planning cannot be served by such a compromise. The one point above all others which its advocates have insisted upon is that continuity of policy from start to finish should be assured, and this cannot be if each specialist is to be in control in turn, however much he may be guided by others whose spheres interlock with his. This brings us to the inevitable conclusion that there must be some person whose training has been not that of a specialist, but of that general nature which will place him in sympathy with all the specialists employed, to exercise the judicial faculty, to co-ordinate and correlate the work of each, and to see that every interest is adequately met; and this is the person who, for lack of a better name, I would call the "landscape architect."

I am afraid that, in advocating this here in England, I am asking too much. I am afraid that so far our outlook in town planning matters has been so narrow that we have each, in effect if not in words, cried out, "I am the man," if we have not added "and wisdom shall die with me!" I would feel repaid for the effort of a hundred such lectures as this if I felt that by giving them I had done something towards the creation of a sympathetic attitude on the part of each of those concerned in the planning of towns towards the work of others, and if I could feel that there was a state of mind taking shape and growing up which would lead ultimately to happy co-operation and collaboration between the architect, the surveyor, the engineer, the cheap cottage expert, the municipal architect, the school architect, the sociologist, the organised play expert, the factory designer and inspector, and every other interest which would allow them all to work in happy collaboration, and finally to report to a man who has a knowledge of every interest in the round sufficient to allow him to correlate the whole. This man we might call the town planner or the landscape architect; but to choose such a man because he is an expert in any one of these directions more than another would, I am sure, be fatal to success.

Chester Tuberculosis Pavilion.—Erected at a cost of £1,750, in the grounds of the isolation hospital on the Chester Corporation's estate at Sealand, a tuberculosis pavilion was formally opened at Chester on Monday. It consists of two wings, one for men and the other for women, and will serve the city and district.

TOWN PLANNING IN CANADA.

RECENT PROGRESS.

An Act has been passed in Nova Scotia which entitles that province to the claim that it has the most advanced legislation in the world in connection with town planning. The Act has been framed on the precedent of the British Act of 1909, but goes much further. A town planning controller has to be appointed by the Commissioner of Public Works for the whole province, and every city, town and municipality (which includes county areas) must appoint a town planning board. The board will consist of the mayor and two members of the council, together with not less than two ratepayers, to be appointed for three years. It will have power to acquire and dispose of lands, and has to appoint a town planning engineer, architect or surveyor.

No street, road or public right of way can hereafter be laid out, and no tract of land can be subdivided or sold as lots unless in accordance with plans and particulars approved by the local board.

Within three years every local board must either prepare a set of town planning by-laws or a town planning scheme. If by-laws are prepared they have to include provision for dealing with the matters set out in Schedule A attached to the Act, which include the following minimum requirements:—

(1) The distance between buildings to be not less than 60 ft. and up to 100 ft. on opposite sides of existing streets, both in respect of new buildings and reconstructed buildings, and to be not less than 80 ft. on new main thoroughfares, whatever the width of the street.

(2) Land to be reserved for new main thoroughfares not less than 60 ft. in width, and provision made for allowing narrow streets of from 24 ft. to 40 ft. where not required for through traffic.

(3) The number of dwellings to be limited on each acre, all windows of dwellings to have adequate light and air, separate areas to be prescribed for dwellings, factories, stores, &c.

The whole province will be subject to the by-laws dealing with the above matters, except in respect of those areas which are dealt with under schemes.

The procedure in connection with the preparation and approval of the scheme largely follows the British practice. A scheme may be prepared, however, with respect to any land—that is, there is no distinction between land not yet built upon and land already built upon. A scheme may also be altered or revoked without the necessity of preparing a subsequent scheme.

Under the compensation clauses, sub-sections have been added to deal with injurious affection and "betterment" as a result of the execution of a scheme, as well as the result of making a scheme.

The local board may not only purchase land for some direct purpose of the scheme, but also land within 200 ft. of the boundary lines of any street laid out, widened or improved by the board, or any park, playground, or other open space which it acquires under the scheme.

The provisions of the British Act dealing with regulations, general provisions, contravention, compensation and methods of enforcing have been adopted, and apply to by-laws as well as to schemes.

The Commissioner of Public Works will probably prepare a model set of by-laws, so that the smaller municipalities will be able to deal with the matter at the minimum of labour and expense. Although the Act provides that local authorities can include land outside their area in their schemes, the fact that the whole province will automatically come under the control of town planning by-laws will reduce the necessity for using this power, and thereby prevent possible friction. It is hoped to get the other provinces in Canada to adopt similar legislation in the near future.

NEW BRUNSWICK.

Although Nova Scotia has now the most advanced Act, New Brunswick is likely to be the first province in which a town planning scheme is prepared. The city of St. John has appointed a Town Planning Commission to prepare a scheme under the New Brunswick Act of 1912, and a map is being prepared for an area of about 10,000 acres.

In many other parts of Canada progress is being made with town planning, but the Maritime Provinces have so far gone furthest in regard to legislation and its practical application.

Construction of Storage Tanks in Peat.*

By HAROLD N. ALVES, [illegible], Resident Engineer on the recently completed Glastonbury Sewage Works.

[illegible] to [illegible] ried out than a treatise on the subject in general.

The writer, acting as resident engineer on the works, had every opportunity of closely studying the peculiar characteristics of peat.

In the first place it is, I consider, absolutely im[illegible] methods of construction in or on the peat, there being such a variety of peats, each having its own peculiarity and requiring suitable treatment.

As an example, the peat in which the storage tanks are constructed is entirely different from that in which the outfall works are built, and this also is very different from peat around Ashcott and Shapwick. There is also a great difference in each stratum of peat. At Porchestall the top stratum consists largely of alder and oak. The next is bracken and small undergrowth. This extends to 19 ft. below the surface, a 5-ft. bed of lias clay comes next, and below down to 30 ft. deep is a dryer layer of black peat consisting chiefly of hazel and small underwood. Shells of the hazel nut were found in great quantity.

The layer of clay found at 19 ft. is in a soft or viscous condition, which, though rapidly hardening when brought into contact with the air, is not stiff enough to carry weight, and piles are easily driven through it. The clay at 30 ft. is similar, but is stiffer as the depth increases, and at 40 ft. is quite a laminated marl formation.

[illegible]

Briefly the history of the construction of the Glastonbury outfall sewage works is as follows:—

[illegible] storage tank to accommodate 75,000 gallons which, by its unusual shape, should support itself in the peat, relying not on any definite or piled foundation, but floating, as it were, in the soft peat. This may or may not have happened, though had the tank been successfully constructed one wonders what would have happened when the tank was pumped out, the action being similar to the pumping out of the water-ballast tanks in submarines with subsequent rising of the vessel.

The top of the tank was intended to lie about 8 ft. below ground level. Excavation was therefore made the area of the tank, 53 ft. diameter over all, and 8 ft. deep. To relieve the pressure on the sides the excavation was sheared down at an angle of 45 deg.

At this depth the peat inside and outside the hole stood practically steady. Any attempt to get below this depth met with failure, the soft peat rising almost as rapidly in the bottom as the excavation was made.

Complete wooden frames were then made to enable the excavation for walls to be taken out in sections, the idea being to take out the peat and drop the concrete in. In this case the pressure of the peat was under-estimated, and the frames buckled.

At this juncture the diameter of the tank was decreased, and the depth increased accordingly, it being thought easier to deal with a smaller area. The contractors also decided to enclose this area with corrugated sheet steel interlocking piles of $\frac{3}{16}$-in. gauge. This was done, the piles being driven to about 20 ft. below the surface. A stout timber frame was fixed, and excavation recommenced.

Before a sufficient depth of peat could be got out to fix a second timber frame the sheet piles began to assume a shape very different to the original circle at which they were driven; the peat in the bottom of the excavation began to rise rapidly over the whole area, but more in the middle than at the sides.

The ground also 70 ft. to 80 ft. around the excavation sank from 6 in. to 18 in.

During the whole of the time these operations were in progress water was making in the excavation in sufficient quantity to keep a No. 4 Pulsometer pump going at full pressure.

Operations were now suspended to consider whether it was advisable to proceed with the work at this spot or seek a more suitable site. To ascertain if the belt of clay had been forced up, a 4-ft. diameter concrete tube was sunk as a caisson in the bottom of the excavation. It was found that the clay had risen as much as 4 ft. in the centre.

It may be argued that, if the sheet piles had been driven into the lower lias clay 30 ft. deep, the work would have been successful. The writer is, however, of the opinion that the pressure below the excavation would have been too great for the piles to withstand it.

While the question of altering the site for the storage tank was being considered by the engineer, the contractors were commencing the construction of the outfall tanks, and as it was certain that the same difficulties would be met with as at Porchestall, it was decided to form the lower cylindrical portion of the settling tanks as caissons in the manner described by the engineer. These tanks are described as being in a floating condition, but I do not think this is at all feasible, or there would certainly be an upward as well as a downward movement. There was certainly a downward movement, and this continued until the peat below the thin belt of clay on which the bottom of the tanks are resting was sufficiently consolidated to withstand the pressure.

It must be borne in mind that the peat below this clay is dry and solid as compared with that above, the clay belt acting as a waterproof covering.

In constructing these tanks the greatest difficulty experienced was that of getting the caissons to stop at the right level for inserting the plank bottom. This was partly done by hanging the concrete rings to timber baulks stretched across the hole on the ground level with strong pulley blocks and chains.

Even after the planking was in place the downward movement went on, and continued right through the construction of the upper circular and octagonal portion. This necessitated the use of a good deal more concrete than was originally intended, and resulted in deeper tanks than shown on the contract drawings.

This caisson construction of the 12-ft. tanks having proved a success, the engineer decided to construct the storage tanks at Porchestall in a similar manner; 15 ft. was the diameter decided upon, and to obtain the necessary storage three tanks, 40 ft. deep, had to be constructed.

The three caissons were formed simultaneously, one ring sunk while the other two were being added to or allowed to set. These rings, on account of their great weight, would sink 9 in. to 12 in. while fresh rings were being added, the concrete sliding through the moulds on the surface. This did not in any way injure the joint or allow the ingress of water, and the whole operation was carried out successfully.

The bottoms were put in without the need of planking, as the lias formation at 40 ft. deep was very hard and dense.

In one of the tanks a spring was found in the bottom. The difficulty of concreting on this was got over by placing loose stones around the spring, and a 2-in. pipe was placed in the centre and the pump connected thereto, and kept going until the concrete floor had set. The pump was then disconnected, and the pipe capped.

* Paper read at a meeting of the Somerset Surveyors' Association at Glastonbury last Saturday.

Town Planning Institute.—The annual meeting of this body has been fixed for the afternoon of Wednesday, June 23rd.

Motor Fire Engine for Rochester.—Efficient fire protection in our cathedral cities is an undoubted necessity, and nowadays, in order to be absolutely up to date, a motor fire engine is a *sine quâ non*. Rochester is the latest cathedral city to take this matter into serious consideration. Here the authorities, after weighing the respective merits of the reciprocating and turbine type of pump, and witnessing tests of both designs, have decided in favour of the Merryweather "Hatfield" reciprocating pump. The order has accordingly been placed for a petrol-driven motor fire engine of this design, with pump to deliver 350-400 gallons per minute. A 50-ft. fire escape will be carried, and ample accommodation will be arranged for hose and gear, while in all respects the machine will be provided with up-to-date improvements. Other cathedral cities having the "Hatfield" type of motor fire engine in actual service are Exeter, Norwich and Carlisle.

Institution of Municipal and County Engineers.

MEETING AT SCARBOROUGH.

(Conclusion.)

We reproduce below the concluding passages of the paper which Mr. Harry W. Smith, ASSOC.M.INST.C.E., the borough engineer, presented at the recent meeting of the Institution of Municipal and County Engineers in Scarborough. The subject of the paper, it will be recalled, was

CATERING FOR THE WANTS OF THE HOLIDAY MAKER.

The Mere is a sheet of water some 10 acres in extent, surrounded by walks and shrubberies. In 1913 the council fitted out a fleet of boats and canoes and established a small cafe. This has proved to be a sound venture financially, although the Mere is situated in a rather "out of the way" locality.

The waters are stocked with coarse fish, and a charge of 6d. per day is made for fishing.

It is at the Mere that the author deals with the problem of refuse disposal.

An extension which will practically double the water area is now in hand, and the banks and roadway surrounding the same are all formed of house refuse.

The author does not claim this to be the ideal method of dealing with the refuse question, but it certainly is economical, and the ultimate result is an asset of considerable value to a pleasure resort. The cost of disposal only by this method is about 7¼d. per ton.

The method adopted is to dump the refuse into a series of hills and valleys, avoiding any appearance of embankment as far as possible, and then covering with from 1ft. 6in. to 2ft. of top soil excavated to form the lake. This is left for about six months, and at the proper season covered with cuttings of various shrubs and trees. These root rapidly, and by the time the excavations are ready to receive the water the banks will be entirely clothed with vegetation.

All the works described in this paper, with the exception of builders' work, have been carried out by direct labour.

TENNIS.

In addition to the provision made for tennis in the public parks and pleasure grounds the town council have constructed sixteen courts on a portion of their Weaponness estate, and leased them to the Yorkshire Lawn Tennis Association, who have erected a very handsome and commodious pavilion. Surrounding the courts are walks and shrubberies, open to the public and maintained at the cost of the council. It is on these courts that tournaments are played.

GOLF.

The provision of a golf course is of first importance to a pleasure resort, and there is much to be said in favour of the same being provided by the municipality.

From information obtained by the author from other towns, it would appear that when this is the case the charges made in connection with such a golf course are considerably lower than is the case when golf is run by private enterprise. At the same time it is also true that in practically all such instances very little has been paid for the land upon which a course may have been formed, waste or common land of little use for agricultural purposes being utilised in most cases.

Although the powers given by the Public Health Act are sufficiently wide as to enable a municipality to acquire land for the purposes of laying out and running a golf course, additional power appears to be necessary to enable a charge to be made for the use of the same; without such power, the provision of a golf course would be a very heavy burden on the rates.

To the mind of a great majority of the ratepayers, golf is a game for the "idle rich," and the promotion of a Parliamentary Bill having for its object the provision of a golf course might be easily wrecked at its inception if a poll of the ratepayers were demanded.

Scarborough has had before it the question of the provision of a golf course for some years, and is still seriously considering the matter. In the meantime the council have leased corporate land to private clubs, who have established an 18-hole course on the South Cliff, and a 9-hole course on the North Cliff, both of which are of an undoubted benefit to the town and have done much to educate the ratepayers as to the value of golf to a pleasure resort.

Ganton, possibly one of the finest of our inland courses, is within 10 miles of Scarborough.

In conclusion, it may not be altogether out of place to add a brief description of the bombardment of the town by the German Fleet on the morning of December 16, 1914, as, on the principle of making "the best of a bad job," it is hoped that the damage wrought to the walls, keep, and barracks on the Castle Hill will remain untouched, as a standing memorial of "German Kultur," and, incidentally, a source of revenue to the corporation from the holiday maker.

The battleships commenced firing from the North Bay at 8.5 a.m., steaming southward; the firing continued for about twelve minutes, when there was a lull of about five minutes, during which the ships turned round and headed northward; they commenced firing as soon as they had turned, and finished at 8.35 a.m. In this short period somewhere between 500 and 600 shells were fired, the projectiles consisting of 3 in., 6 in., and 11 in.; of the two former a number were found unexploded, but with regard to the latter, fragments only have been found. There is evidence of common shrapnel and armour-piercing shells having been fired, one, probably of the latter variety, being embedded in the sea wall of the Marine-drive to a depth of 10 ft.

From a plan showing the positions struck by the shells, prepared by the author, it would appear that the points receiving chief attention were the coast-guard station, and Old Barracks on the Castle Hill, the wireless station and storage reservoirs on Oliver's Mount, and much of the damage wrought in various parts of the town resulted from bad shots aimed at these points. The heavy damage wrought to the Grand Hotel and the South Cliff may be attributed "to the general policy of 'frightfulness.'" In all, some 209 buildings were damaged, including many private dwelling-houses, ten public buildings, seven churches, five hotels, &c. Nineteen people were killed, and about eighty-four injured. Some of the shells fell inland 4½ miles. During the firing a section of the fleet were engaged in laying an extensive mine field, which resulted in the blowing up of a number of vessels and the loss of several lives.

DISCUSSION OF MR. SMITH'S PAPER.

Mr. F. MAGGS (Wakefield), in proposing a vote of thanks to Mr. Smith, said he was sure they were all indebted to the latter for the trouble he had taken in preparing the paper and for arranging the meeting. While he was not quite sure that he did not like Scarborough five years ago better than he did now, he realised that it was necessary that something should be done to combat the erosion of the coast that was going on, and he felt that all that had been done had been carried out with a due regard for the preservation of the natural beauties of the place.

Mr. W. J. STEELE (Newcastle-on-Tyne), in seconding, said a perusal of the paper and accompanying drawings showed the real engineer or architect that Mr. Smith had taken advantage of the natural configuration of the district in any work that he had carried out. If they looked at the plan of the bathing pool, or of the gardens, they would see that by getting hold of a wrong conception those works might easily have been ruined; but Mr. Smith had taken advantage of the slope and the vistas, and, one could see, had brought out the natural points of the district by assisting them, and made the whole scheme quite good. One often saw in places that were supposed to be made beautiful too much artificiality. There was nothing more depressing and ugly than a structure which was at all out of keeping with its surroundings. Take a little valley with a river running through it, where they saw one of these horribly ugly ferro-concrete bridges; whereas, if a stone bridge had been constructed it would have been in keeping with the surroundings. To put up these things because they were the fashion was utterly wrong. The main principle which Mr. Smith had attempted, and very success-

duly carried out, was to help what he found on the ground. That, to his mind, was the greatest testimonial that could be paid to any man who had carried out work that he had got a proper conception of what he was set to do.

The vote of thanks was carried.

In replying Mr. Smith said it was with the very greatest pleasure that he welcomed the institution to Scarborough again. The last eight or nine years had been very busy years indeed. The borough boundary had been extended, they had a town planning and housing scheme on the way, and many other important works, including street improvements. But possibly they had devoted the bulk of their energies to bringing Scarborough up to date and on a par with other pleasure resorts. The latter were continually going forward, and they intended to keep pace with them. He had endeavoured as far as possible not to destroy the natural beauties of Scarborough. He appreciated them because as much as anyone, but there were points at which they could not leave the cliffs as things were—much as they would like to. The cliffs at the best were formed of very varying strata, but largely of soft sandstone overlying shale. There was considerable erosion at the foot from the sea, and any number of land streams, and if they were left alone the cliffs came down. He would show them on their visit what took place the previous week, and they would see how necessary it was to protect the cliffs. He would much rather have a sandstone cliff than a concrete wall, or a stone wall, or anything of the kind, but this work had got to be done in places, and they would see how necessary it was to protect them. He had done his best to make the work harmonise with the surroundings. The chief work was the South Cliff Gardens. The diagrams would give them some idea of the problems one had had to tackle. They were very fortunate, however, in regard to the ground, for some twenty or thirty years ago the then owners planted it very extensively with trees, and that had helped enormously. He had cut down a few trees, but planted a great many more, and carried out very extensive drainage works. The abnormal rainfall of the past winter had increased their difficulties. The beginning of the winter found them with the cliff all stripped bare and re-modelling down, but they had now almost got the matters over it. He had hoped to be able to show them the bathing pool more nearly complete, but the powers that be had put their foot on them and they had been compelled to slow down. But he thought that when completed the pool would not only prove a source of attraction to Scarborough, but revenue producing. Members would observe from the paper that many of the works mentioned were revenue producing; some might not be bringing in much money, but they were at any rate paying their way. The Alexandra Gardens was a piece of land from which they used formerly to get a rent of about 50s. a year for grazing donkeys. They got a good deal more from it now. He had no doubt that the Floral Hall would have realised £1,400 for concerts this year but for the war. The Peasholm Park was a piece of Nature, but there used to be pig-sties and hen-coops on it. On the west end he had endeavoured to make the best of the water available. One feature was the use they had made of their house refuse. They had no refuse destructor in Scarborough, and it did not seem as if they would have for many years to come. Practically one-third of that lake was made from the contents of the ashbins; but if properly treated it could be made a thing of beauty. That park was only in its infancy. There was another bit of Nature—a glorious bit—he was going to trim up, and he hoped he should not misuse his opportunity. Then there was the piece under the Undercliff. The corporation main sewer ran under it, and the sewer had become out of repair and an eyesore. They put a wall in front of it, and erected a lot of bungalows, which had been immensely popular. He had seen bathing bungalows in other places, but they were usually put up higgledy-piggledy. They cost from £28 to £50, and they got varying rents, from £5 to £14 a year. It was not really so much the rental, which covered the outlay, but the enormous amount of pleasure it gave to a seaside holiday. Parents could take the children to the beach and stop the whole day there. They were considerably extending the number of them. There was a good demand for them, and he had no doubt they would be equally as popular as the present bungalows. Mr. Smith went on to recall that the last time the institution visited the town the authorities were in terrible trouble with the Marine-drive. Along with Mr. Walker, the engineer to the Tyne Commissioners, he suggested certain measures, but the council would not provide the money. Accordingly they adopted another form of repair, which so far had succeeded very well. The method adopted was a series of concrete toes extending along the damaged length of the wall, with an extensive apron in between. In conclusion, Mr. Smith referred to a number of shells which were exhibited on the chairman's table. These were among those that failed to explode on falling during the bombardment of the town, and it was probably, he observed, the first time in the history of the institution that the president had been supported by such grim souvenirs.

After tea the PRESIDENT said that Mr. Smith might tell them how he made the bottom of the pool watertight.

Mr. SMITH: By puddle. The bottom of the lake was clay puddle. Where the refuse was tipped in at the eastern side that was a clay bottom; otherwise they would have had a little trouble with the filling.

Mr. DYER (Bridlington) asked whether the puddle was 2 ft. thick.

Mr. SMITH: Certainly, and perhaps a little more. There was not a single leak.

The PRESIDENT: You have not a large amount of water coming down?

Mr. SMITH: No, except in the case of snow; a fair quantity comes down after snow. He was sorry they were unable to take members to the Mere. It was a larger sheet of water, and they would have seen the raw material there. That was part of a rather ambitious scheme for a lake of 16 or 17 acres of water interspersed with a number of islands. The cost of refuse disposal was very low, and included putting it in place and covering it with surface soil.

The PRESIDENT asked how often they proposed to empty the bathing pool.

Mr. SMITH replied that that would be a matter of experience. Personally, he thought it would be unnecessary to empty it at all. At high water it was seldom that the sea would not wash over it. It would thus get a freshening up at every tide.

A collection for the Orphan Fund of the institution taken in the course of the meeting realised a sum of £2 11s.

ARTERIAL ROADS IN GREATER LONDON.

THE SOUTH-EASTERN SECTION.

On Wednesday at the Local Government Board offices, Whitehall, Mr. G. W. Hume, K.C.C., took the chair at a meeting of the South-Eastern Section of the Committee formed for the consideration of arterial roads in Greater London.

In opening the proceedings the chairman made reference to the death of Mr. J. Rush Dixon, borough engineer and surveyor of Woolwich, who was a member of the section. He was sure, he remarked, that those who had been working with Mr. Dixon on the Investigation Committee realised what a valuable colleague they had. Mr. Rush Dixon had his heart in the work, and he would have been of special use to them when they came to deal with details, including the question of price. He moved that a vote of condolence be sent to the family. Mr. E. van Putten, borough surveyor of Lewisham, seconded, and in doing so associated himself sympathetically with what had fallen from the chairman.

The conference then proceeded to consider the report of a sub-committee on the subject of the proposed arterial roads, and adopted a recommendation as to the desirability of preparing preliminary estimates as soon as possible of the probable cost of the proposed improvements in order that, in the event of unemployment, following the war or otherwise, information as to a useful outlet for labour might be available.

The conference adopted, in an amended form, a proposition by the sub-committee that powers should be given to county councils, after consultation with the local authorities concerned, to prescribe building lines to existing roads, subject to an appeal to the Local Government Board.

The reports submitted included particulars of the routes proposed for the new arterial roads from Old Kent-road to Catford, Bromley by-pass, Eltham by-pass, and the South Circular Road.

Assistants' and Students' Section.

CONDUCTED BY SYDNEY G. TURNER, ASSOC.M.INST.C.E.

All communications in regard to this page must be addressed to The Editor, St. Bride's House, 24 Bride-lane, Fleet-street, E.C. *Envelopes must be marked "Assistants' Section" in the top left-hand corner. Correspondents are invited to submit questions for consideration and answers to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.*

THE MONTHLY PREMIUM.

Mr. ERNEST W. PUGH, of Southampton, to whom the premium for April was awarded, has selected Taylor & Thompson's "Concrete, Plain and Reinforced" (Chapman & Hall, Limited), and a copy of this work has been duly sent to him.

QUESTIONS.

This week answers are invited to the following questions:—

474. Roof Truss.—When one end of a steel roof truss is supported on roller bearings, what provision is made to counteract the movement and to prevent damage to the slates and timbers? How would any movement in the truss affect the roof covering? How much is a 50-ft. span roof likely to move? ("T-Square.")

479. Reservoir Dam.—Give sketch and description of an earth embankment, with clay puddle across a mountain brook 12 ft. wide, rising from each side of brook 1 in 2, the embankment to be 12 ft. high in [illegible]. (R. P. M., *Tregyn.*)

480. Sewer Survey.—It is required to survey the course of an old brick sewer, 5 ft. diameter, which runs for 1,000 yds. in a very irregular line in a thickly populated district. There are no available manholes. How can this be done, and what instruments would be used? (W. S. W., *Chesterfield.*)

481. Water Towers.—What are the objects of water towers, and how did they originate? Is there any book dealing with this subject? ("Rewot.")

482. Bridge Construction. How are the angles of the four wing walls of a bridge and the horizontal angle between the bridge and each wall determined? [illegible].

[The Editor is at all times glad to hear from readers who desire to submit questions regarding matters of general interest, points of daily practice, &c., for insertion in the 'Assistants' and Students' Section." Questions which are published are taken into consideration, as well as other matter, in awarding the Monthly Premium.]

REPLIES TO QUESTIONS.

477. Levelling.—In a series of levels, if the first back sight read 3·25 on an ordnance bench mark of 28·30, the sum of the back sights be 12·95, and fore sights 17·20, what will be the ordnance reading of the last fore sight? (E. W. P., *Southampton.*)

[illegible] reply to this question has been received since our last issue.

If the sum of the back sights be subtracted from the sum of the fore sights, we shall get the total fall—viz., 17·20 − 12·95 = 4·25 ft. fall from B.M. to last [illegible]. We are given the B.M. = 28·30. ∴ ordnance reading of last fore sight = 28·30 − 4·25 = 24·05. [illegible] this result.

We start with the ordnance B.M. of 28·30, the first back sight is 3·25; ∴ 28·30 + 3·25 = 31·55 = the height of the level and first front reading. We are given that the sum of the front sights = 17·20; let us assume that the first front sight is 8 ft. and the second 9·2 ft. 31·55 − 8·00 = 23·55 = ground level and first front sight or second back sight. We are also given that the sum of the back sights = 12·95, and first back sight = 3·25; ∴ second back sight = 9·70.

23·55 + 9·70 = 33·25 = second height of level. 33·25 − 9·2 = 24·05 ground level at last fore sight. (J. W., *Leeds.*)

478. Levelling.—It is required to find the difference of level of two pegs on opposite banks of a river, and it is known that the collimation line of the level you have to use is out of adjustment. How would you find the difference of level required? (E. W. P., *Southampton.*)

The following additional reply to this question has been received since our last issue:—

To find the difference in level of two pegs on opposite banks of a river, with a level known to be out of collimation, have two additional pegs driven in exactly opposite each other, and to the precise level of the water in each case. Set up the level and take the readings of the peg A on the bank and the peg C at the water level on this side of the river, and also that of the peg D on the opposite side.

Now the pegs C and D must be at the same level, and the difference in their readings gives the error in collimation. The reading on peg B should then

be taken, and by calculating on the basis of the error found to exist its level compared with A may be accurately determined. If it be possible to cross the river with the level, or if the distance be so great that the staff could not be distinctly seen, the levels could be taken on peg A and C; then be setting the level up on the other side of the pegs B and D, in which case the difference of the pegs on the bank above those of the water would be given, and from this the comparative level of A and B could be found. ("T-Square.")

481. Testing Materials.—Mention some tests by which we can estimate or measure the ductility of metals, and some of the reasons which make it important to obtain a test of this property. (A.M.I.C.E.)

The most important tests are as follows: (1) A test-bar of the material is hammered when cold in such a way as to bend it through an angle of 180 deg. A very usual requirement in specifications *re* the ductility of a metal is that the metal shall withstand this test without cracking or splitting at the bend,

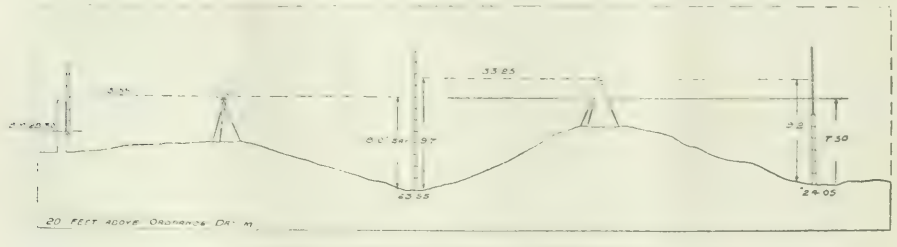

DIAGRAM ILLUSTRATING REPLY TO QUESTION 477

the diameter of the bar being specified. (2) A test-bar is hammered when cold in such a way as to reduce its cross-sectional area. This also must be accomplished without cracking, the amount of reduction

The Surveyor
And Municipal and County Engineer.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of Surveyor *readers with a view to making the information given under this head as complete and accurate as possible.*

INQUIRIES HELD.

Brampton R.D.C. (May 11th. Mr. A. G. Drury). £3,600 for a water supply for the parish of Cumwhitton, including the townships of Northwaugh and Moorhouse. Mr. W. Wallis, engineer, Newcastle-on-Tyne, who prepared the scheme, stated that the assessable value of the parish for sanitary purposes was £2,065, and a penny rate would produce about £9 for waterworks purposes. The existing water supplies were anything but satisfactory, being chiefly obtained from local brooks and springs, while the fields in numerous instances are without any source of water supply whatever. Briefly put, the scheme consisted of taking water from the springs, whence it will gravitate to a service reservoir, from where distributing mains will be laid along the road to Cumwhitton village. The minimum flow of the springs is about 20,000 gallons a day, and as a maximum of 10,000 gallons only is required for the district there will always be a continuous flow of water down the existing stream. The water will be taken as "underground water," and anything in the nature of taking flowing water in a defined course will be most carefully avoided. Any excess of water not required for the district will pass over the overflow into the existing stream. The springs issue at a level of 570 ft. above sea level. They will therefore be able to supply the greater part of the inhabited district of the parish by gravitation, and no pumping will be necessary. The cost is estimated at £3,600.

APPLICATIONS FOR LOANS.

Derby T.C. £5,057 for the electricity undertaking.

Goole T.C. £6,000 for a sewerage scheme.

Ipswich T.C. £5,200 for the extension of the refuse destructor.

Middlesbrough T.C.—£3,000 for electricity mains and house services.

Portslade U.D.C.—£1,300 for works of surface-water drainage.

Salisbury and District Joint Hospital Committee.—£1,500 for hospital extension.

Tees Port Sanitary Authority.—£2,250 for the removal of the floating hospital to another site.

Wigan T.C.—£987 for additional expenditure on double deck tramway cars.

LOANS SANCTIONED.

Girvan T.C. £1,030 for works of road improvement.

Goole U.D.C.—£600 for the provision of a cooling-house at the public slaughter-house.

Rotherham R.D.C. £402 for sewerage works.

Woolwich B.C.—£35,000 for electricity purposes.

Yarmouth T.C. £800 for cemetery extension.

FORTHCOMING INQUIRIES.

MAY.	£
25.—**Newbury.** For the provision of workmen's houses (Mr. Courtenay Clifton)	1,800
25. **Shrewsbury.** For the provision of aeration plant (Mr. R. H. Bicknell)	1,070
26. **Eccles.** For the purposes of an improvement scheme (Mr. Edward Leonard)	
26.—**Dinas Powis.** For the provision of a burial ground (Mr. R. H. Bicknell)	2,000
26. **Stafford.** For works of sewage disposal (Mr. A. G. Drury)	19,000

Bath and West and Southern Counties Society's Show. Messrs. Marshall, Sons & Co., Limited, Gainsborough, are among the exhibitors at this show which opened yesterday at Worcester. All their exhibits, which are on Stands Nos. 87 to 90, Shed No. 21, disclose features of careful design and excellence of workmanship which are so characteristic of this well-known firm. The machinery comprises a steam tractor, a traction engine, two threshing machines, and an elevator. Two "Marshall" oil engines are also on view, and these demonstrate that the firm can produce high-grade internal-combustion motors of a type which bids fair to earn as high a reputation for excellency of design as has been attained with their world-famed portable steam engines.

THINGS ONE WOULD LIKE TO KNOW.

(Contributed.)

Is not the death of Mr. Rush Dixon, M.Inst.C.E., the borough engineer of Woolwich, a sad loss to the municipal engineering profession? Was he not well known as a man of eminent professional ability and skill, and one who kept himself well to the forefront in all things pertaining to municipal engineering and its multifarious ramifications? Shall we not all miss him very greatly, and heartily sympathise with his widow and daughters?

* * * *

Would not the report of the Civil Engineers Appointments Board, recently issued by the Institution of Civil Engineers, have been of more interest if the board could have stated the number of appointments they had secured for the applicants who had registered their names on the books as requiring employment? Does not this omission make the report of little or no interest? And does it not also give opportunities for critics to wonder if the board has been as useful as it was hoped it would be when it was first constituted?

* * * *

Are not the council of the Institute of Sanitary Engineers to be congratulated on their report for the year 1914, which shows how greatly the position of this useful institution has improved during the last few years? Is it not satisfactory to learn that the liabilities have been reduced by £400 during the past four years, and that the deficits which existed for many years are now changed to a surplus of over £216? Should not all sanitary engineers loyally support this institution by enrolling themselves as members, and take an active part in the proceedings?

* * * *

How is it that the Engineering Unit of the London National Guard is not receiving the support that would be expected if the engineers practising in London were more keenly alive to the grave danger in which this country now stands? Is it not almost to be regretted that this country has no frontier that can be attacked, and that we are apt to be lulled into a state of dangerous inactivity? Are engineers so busy that they have no spare time? Or what is the reason that so many are standing aloof from joining this useful and valuable adjunct to our Regular Army?

* * * *

How long will it take H.M. Office of Works to realise that water-bound macadam roads are now somewhat out of date, even for pleasure traffic, and would it not be well if some of their engineering advisers learnt something of the principles of road making?

* * * *

Are there not still a large number of young able-bodied men in Government offices whose work might easily be accomplished by women, or old men, and their services given in fighting for their country? Is it not a fact that at the present time one soldier is worth any amount of civilians unless the latter are engaged in connection with the supply of munitions? Do we yet quite realise that nothing except fighting is going to bring the war to a close?

Welsh Tramway Bills.—The Tramways Extension Bill of the Rhondda Urban District Council has been sent by the Examiner for second reading in the House of Lords. The Bill has been through the Commons. The Aberdare Urban District Council Tramways Bill, which has passed the Lords, has been ordered for second reading in the Commons.

Treasury Committee and London County Council.—In the House of Commons Mr. Chamberlain asked the Chancellor of the Exchequer whether he could communicate to the House the result of the inquiry which he promised to make of Lord St. Aldwyn as to the attitude of the Treasury Committee on new issues towards the London County Council new building scheme for schools. Mr. Acland, who replied, said that Lord St. Aldwyn had intimated that the Committee on Fresh Issues did not formally consider the application as they were informed that it had already been sanctioned by the Cabinet. Lord St. Aldwyn added that, if the case had been formally considered by the committee he felt sure they would have refused to sanction it.

Municipal Work in Progress and Projected.

The Editor invites the co-operation of Surveyor *readers with a view to making information given under this head as complete and accurate as possible.*

The following are some of the more important prospected works of which particulars appear below:—Building: Burnham, Launceston, Stratford, houses and town planning: Chesterfield, Wigan, roads and tarring: the Kesteven, Wigan, sewerage and sewage disposal: Middlesbrough, water, gas and electricity: Battersea Clinton. Particulars of other prospected work will be found on our "Local Government Board Inquiries" page.

BUILDINGS.

Battersea B.C.—An intimation has been received of the intention of the Metropolitan Water Board to erect new premises and to make alterations to existing buildings at their works in Craigentinny.

Bodmin T.C.—A block plan of the proposed new cemetery at the Lizard, which was prepared by the borough surveyor, Mr. R. I. Bascombe, has been referred to the Sanitary Committee, who have been authorised to obtain tenders for carrying out the work.

Burnham U.D.C.—The county council have been notified by the urban district council of a proposal to provide a joint isolation hospital with the Highbridge Urban District Council.

Colne T.C.—Sir William Hartley has made an offer to provide a new hospital, consisting of twenty-four beds, on condition that the existing hospital is converted into a convalescent home as part of the proposed hospital.

Ealing T.C.—The foundation-stone was laid recently of a new branch public library in the Castle-road district. The plans have been prepared by Mr. Mervyn Macartney, and Messrs. Patman & Fotheringham, Islington, are the contractors.

East Sussex C.C.—It has been decided to make extension to the mental home at Hellingly asylum.

Falmouth T.C.—The borough surveyor, Mr. H. E. Tresidder, has been instructed to obtain tenders for internal decorations to the pavilion at Gyllyngdune, and to prepare estimates for painting the exterior.

Glasgow T.C.—It is proposed to provide a mortuary at Stonyetts, at an estimated cost of £615.

Hexham T.C.—The Local Government Board have asked the town council to submit for their consideration plans of the proposed new hospital.

Launceston T.C.—The council have appointed a committee to meet the rural district council in order to discuss a joint scheme for an isolation hospital.

Norwich T.C.—The Education Committee have decided to purchase property, at a cost of £400, for the extension of the Surrey-road school.

Portsmouth T.C.—A proposal is to be submitted to the next town council meeting for the erection of a tuberculosis hospital at Longstone.

Sleaford U.D.C.—It is proposed to erect an isolation hospital, at an estimated cost of £1,000.

Sunbury U.D.C.—It has been agreed to join with the Staines Rural District Council for the treatment in their small-pox hospital of patients from Sunbury.

Sunderland T.C.—The Electricity and Lighting Committee recommend that the foundation work for the two new motor generators to be installed at the Dunning-street electricity works be carried out by direct labour under the supervision of the general manager and engineer, at an estimated cost of £277, to be borne out of current revenue.

Swansea T.C.—The Local Government Board is to be asked to sanction a loan for the erection of an isolation hospital.

Teddington U.D.C.—The council are negotiating with the Staines Rural District Council with a view to providing a joint small-pox hospital.

Torrington T.C.—The Building Committee are considering plans for an extra ward at the hospital as an emergency ward.

HOUSING AND TOWN PLANNING.

Chesterfield T.C.—The assistant borough surveyor has prepared a scheme for the erection of thirty-eight houses for the working classes, at a cost not exceeding £185 each.

East and West Flegg R.D.C.—The Local Government Board have expressed approval generally of the housing schemes proposed by the council for Hemsby and Winterton, but suggest that it would be preferable to provide some houses of a smaller type, and that the schemes should be amended to provide, say, one pair of the council's type and two pairs on the lines given in the memorandum forwarded on August 6th. It is understood that the question of erecting a town must be deferred.

Lichfield T.C.—The consent of the Local Government Board is being sought to the appropriation of corporation land as a site for a housing scheme.

Margam U.D.C.—It has been decided to build a number of working-class houses in Marketstreet.

Newton Abbot U.D.C.—A committee has been appointed to consider the question of sites for a housing scheme.

Rainford U.D.C.—It was reported on Tuesday that eight of the fourteen cottages erected by the council were completed and ready for occupation. The council embarked on the scheme in September last, when, after Lord Derby had generously offered a most eligible site at a nominal cost, the sum of £2,500 was borrowed with the consent of the Local Government Board. The houses are in blocks of seven each, and contain three bedrooms, with a similar number of rooms below, and the usual domestic conveniences.

Truro R.D.C.—The Local Government Board wrote that they saw no reason why the council should not proceed with the preparation of housing schemes for Gerrans, Feock, Kea, St. Just, and St. Erme, and submit them to the board with a view to the schemes being carried out without delay when circumstances permitted. It was decided not to move in the matter until the war is over.

Wigan T.C.—The council recently adopted a modified scheme for the erection of working-class houses. It is proposed that twenty-eight of the houses fronting Melverley-street and Pottery-road should have little gardens at the front, and also be ornamented with stucco work. The estimated cost of ninety houses, and the laying out of the site and making the streets, is £18,395. The rents of thirty-seven houses will be 5s., and of fifty-three houses 6s. a week, making a yearly rental of £1,307 16s., while the annual expenditure was estimated at £1,617 8s. 7d. This appears to show a loss of £309 per annum; on the other hand, it is pointed out that the scheme would add £339 to the rateable value of the town, as well as yield a ground rent of £79, so that, instead of there being a loss, there would be an actual gain to the town.

REFUSE COLLECTION AND DISPOSAL.

Formby U.D.C.—The Health Committee have adopted a resolution suggesting that the householders should be circularised urging them to burn as much combustible refuse as they possibly could, instead of the authorities having to remove the material to be burnt at the tip.

Hove T.C.—The Sanitary Committee recommend the town council to ask for the sanction to a loan of £5,000 for the provision of crushing machines in connection with the disposal of refuse.

Ipswich T.C.—Messrs. Heenan & Froude and Messrs. Catchpole & Sons are the contractors for works in connection with the refuse destructor, the cost of which is estimated at £5,200.

ROADS AND MATERIALS.

Barrow R.D.C.—Owing chiefly to the opposition of the county council, it has been decided not to proceed with the Anstey Green Lane-road improvement until the end of the war.

Bollington U.D.C.—A scheme has been approved for the improvement of Wellington-road, at an estimated cost of £1,500.

Cornwall C.C.—An intimation has been received from the Road Board that the grants to Cornwall for improvement works during 1915-16 would be very considerably reduced, and consequently the programme has been revised and a schedule approved, the total cost of the revised schedule being £8,284.

Derby T.C.—The Highways Committee recommend

the acceptance of the tender of Messrs. Foden, of Sandbach, at £665, for the supply of a motor wagon.

Durham R.D.C.—The surveyor, Mr. G. Gregson, has been authorised to place with Fodens, Limited, an order for one motor tipping wagon to carry 5 tons, at a cost of £665, and the question of providing a second wagon has been deferred until next year. It was stated that the wagon would repay itself in a year and a-half.

Hammersmith B.C.—Consideration is being given to a scheme for the construction of a number of new roads to the west of Wood-lane, including a road about a mile in length, which it is proposed to form as a main arterial road.

Hove T.C.—In compliance with a request from the military authorities, the council have agreed to make up the portion of School-road between Portland-road and Marmion-road, at an estimated cost of £331. The section of Portland road is now being used as a hospital, and the council have the money in hand to make up the road.

Hursley R.D.C.—It was reported that the grant allowed by the Government for road repairs, owing to damage by military traffic, was £3,555, including £86, which was equal to 2½ per cent for the surveyor, Mr. A. H. Brain, for supervising the work. The sum of £1,853 had already been paid, and it was decided unanimously that a moiety of the percentage should be at once paid over to the surveyor.

Jarrow T.C.—Notices are to be served upon the owners for the making up of a number of roads.

Kesteven C.C.—The Road Board have sanctioned a grant of £1,400 for the purposes of [illegible]

Maldens and Coombe U.D.C.—Tenders of Messrs. Willis & Powis, at £1,474, and Messrs. John Wainwright & Co., Limited, at £150, have been accepted for work in connection with the improvements to South-lane.

Newton Abbot U.D.C.—The road from Penn Inn to Pinsent's brewery, Highweek-street, is to be tar-sprayed at a cost of £100.

Rochdale T.C.—The Cleansing Committee are considering the question of providing a motor sweeping machine.

Stanley U.D.C.—Tenders are to be obtained for cementing a number of footpaths.

Tilbury U.D.C.—Tar-spraying operations are to be carried out at an estimated cost of £240.

Warminster U.D.C.—A letter was received from Messrs. Field & Mackay stating that they were unable to supply road material at the tendered price owing to the increase in wages, &c., and suggesting that the price should be increased 6d. per ton. The council have decided to agree to this, subject to the contractors entering into a written contract to supply materials at the amended price for the ensuing year.

Wigan T.C.—Contracts have been accepted for granite setts for the repaving of parts of Wallgate, Prescott-street, Albert-street (Newtown), Birkett Bank, and School-lane, for which work the council have now received the sanction of the Local Government Board. All the work proposed some time ago has not been sanctioned, and the council have decided to fill up the holes in the surface, and so carry on until the Local Government Board allowed them to do the work properly.

SEWERAGE AND SEWAGE DISPOSAL.

Brandon U.D.C.—The tender of Messrs. T. Watson, at £199, has been accepted for the construction of a sewer at Station-avenue, Brandon Colliery.

Easingwold R.D.C.—The council are giving consideration to a report from Messrs. Fairbank & Sons, York, on the subject of the Stillington sewerage scheme. The report stated that the general effect of their suggestions would be to remove the sewage of the eastern part of the village, from the ditch in Mill-lane, in front of the Hall, and to discharge it, after proper tank treatment, into the Foss at a point where it would meet the full stream of the river. The total estimated cost of the scheme at the present market rates would be £281.

Llanfyllin R.D.C.—It has been agreed to proceed [illegible] £500.

Middlesbrough T.C.—Application [illegible] the Treasury for sanction to a loan of £8,000 for a sewerage scheme.

Nottingham T.C.—It is reported that the profit on Stoke Farm last year was £611.

Radcliffe U.D.C.—A sewerage scheme for Starling and Ainsworth is to be carried out, at an estimated cost of £2,000.

Ruislip-Northwood U.D.C.—A new sludge main is to be constructed at the sewage disposal works, at a cost of £85.

Stirling C.C.—It is proposed to instal a Fiddian distributor at the Bonnybridge sewage disposal works, and to reconstruct the filter-beds, at an estimated cost of £700. It has likewise been agreed to construct sludge ponds at the Longcroft works, at an estimated cost of £128.

Tavistock R.D.C.—The suitability of a proposed [illegible] at Whitchurch has been referred to the parish council for consideration.

Uxbridge R.D.C.—The tender of Mr. Hanson, at £751, has been accepted for the Harefield drainage scheme.

WATER, GAS, AND ELECTRICITY.

Aberdeen T.C.—A proposition not to proceed with the Provisional Order in connection with the £75 water supply was defeated recently in the town council by 23 votes to 4.

Ashbourne U.D.C.—The council are seeking to make provision for an extension of the water supply.

Barnsley T.C.—The council have adopted a scheme for the extension of the electricity works, at an estimated cost of £21,850.

Battersea T.C.—The proposal to extend a supply of electricity to the Nine Elms district, at an estimated cost of £15,750, is not opposed by the Treasury.

Bingley U.D.C.—The financial statement of the gas department for the year ending March 31st last shows a nett profit of £598. The chairman of the Gas Committee (Mr. Whitwam) said that in consequence of the way in which they had secured their coal supplies, it would not be necessary to increase the price of gas, now 1s. 10d. per 1,000 cub. ft., but he could not promise to avoid increasing the price another year.

Blackrock U.D.C.—The electric lighting scheme has received the sanction of the Local Government Board, and application is to be made to the Treasury for authority to borrow the money for the works.

Bridgend U.D.C.—The Local Government Board is to be asked to sanction the purchase of two engines for the electricity works, at an estimated cost of £2,000.

Bristol T.C.—The Electricity Committee recommend the purchase of a 6,000-kw. turbo-alternator at the Avonbank works, at an estimated cost of £26,949.

Calne R.D.C.—Consideration is to be given to the improvement of the water supply at Foxham.

Clutton R.D.C.—A communication has been received from the Local Government Board stating, with reference to the proposals of the council for a scheme of water supply for the parishes of Chelwood, Chew Magna, Chew Stoke, Norton Malreward, Publow and Stanton Drew, at an estimated cost of over £10,000, that the board would consider an application for their sanction, but that at the present moment they could not promise to authorise a loan.

East Lothian C.C.—The council have authorised the Finance Committee to raise a loan of £300 for the Innerwick water supply.

East Riding C.C.—The question of a water supply for Patrington was before the council lately. The Public Health and Housing Committee had resolved [illegible] Council failing to make arrangements with the Hull Corporation for a supply of water to their area within a reasonable time, the clerk be instructed to obtain and submit to the committee information as to the villages in the Patrington Rural District for which a water supply is needed, and as to the cost of providing a supply from the mains to be laid by the Hull Corporation. The county council adopted the proposal of the committee.

Edinburgh T.C.—The Electric Lighting Committee recommend the council to accept an estimate by the Stirling Boiler Company, Limited, Renfrew, amounting to £32,000, for tube boilers for the new electrical station at Portobello. It is understood that the

[illegible] is less than was expected in view of [illegible]

Kilrush U.D.C.—The council are inviting applications from engineers [illegible] to supply them with plans for a [illegible] (within the urban area) for the town of Kilrush.

Lewisham B.C.—The General Purposes Committee [illegible] objections urged by the borough council to the Metropolitan Water Board Bill before the Commons. With reference to the breaking up of streets the committee added the following words to the Bill: "Nothing in this Act with regard to the breaking up of streets shall affect the rights of the Metropolitan borough council under the Metropolis Management Acts [illegible] of any road and to recover the cost of so doing from the board." The committee also granted an amendment to clause 46 (in the original Bill) with reference to the cutting-off of water, and they struck out clause 47 which would have empowered the Water Board to recover expenses incurred preliminary to cutting off supply in certain cases.

Margam U.D.C.—A loan of £5,000 is to be taken up for the purpose of [illegible]

Market Harborough R.D.C.—A letter has been received from the Local Government Board stating that as the board have [illegible] sec. 299 of the Public Health Act, that the council is in default in supplying the village of Fleckney with water, the board have directed an inquiry into the [illegible]

Okehampton T.C. [illegible] by steel tubes, providing a sluice valve hydrant in [illegible] receive a meter.

Rotherham T.C.—The nett surplus of the electricity undertaking, subject to the requirements for the renewal fund, [illegible] Practically half of this decrease of £2,572 was the result of the reduced price of current to the tramways department, and the balance of the decrease was principally due to the increased price of coal and heavier repairs to plant. With regard to the gas undertaking, the provision made in the estimates last year to meet the anticipated deficiency has proved to be adequate, and there is a credit balance of £50 to be carried forward.

St. Pancras B.C.—One-third of the street lamps only are now lit, and these are extinguished by 10 p.m. As during the lighter evenings there would be scarcely any interval between the completion of the lighting and the commencement of the extinguishing of the lamps, the council have agreed that, for the next three months, the gas lamps in the borough be not lighted.

Skegness U.D.C.—New water mains are to be laid at an estimated cost of £1,000.

Strabane U.D.C.—Tenders are to be obtained for a new sulphate of ammonia plant for the gasworks.

Swanage U.D.C.—With respect to the proposed water supply scheme for Studland, it was announced at the recent council meeting that the War Office are prepared to take over the whole of the council's scheme, make the bore, and simultaneously lay the main, and provide the necessary plant, the council to pay easements and compensation to the tenant. In the event of a success, the council are to take over all the plant not of a temporary character, and pay the War Office what the cost was to them, the test to be a continuous supply of not less than 8,000 gallons per hour per day of twenty-four hours, in September. The council are only to be compelled to buy in the event of the test proving satisfactory to the council's engineer, Mr. W. H. Pearce; but in the event of a failure they will have to pay the War Office the sum of £650, the estimated cost of the experimental bore the council contemplated making.

Wigan T.C. The chairman of the Electric Light Committee recently called attention to the finances of the electricity undertaking. In 1913-14 their excess of payments was £1,609, and for 1914-15 it was £995 [illegible] notwithstanding that they had had to pay during 1914-15 a sum of £1,100 more for coal than in the previous year; so that, adding the two sums together, the station was £1,714 better off.

Willesden U.D.C.—It was announced that the clerk and Mr. Blake, the electrical engineer, waited upon the Local Government Board with reference to extending the electricity undertaking so as to supply current to factories engaged in manufacturing the munitions of war in West Willesden, and the board had sanctioned the work being carried out.

Wombwell U.D.C.—The Local Government Board [illegible] ply limits to Great Houghton and Little Houghton.

MISCELLANEOUS.

Fareham R.D.C.—The council have accepted the tender of Mr. Charles Bennett, at £112, for the supply of a "Morgan" tri-car for the use of the sanitary surveyor.

Kingston (Surrey) T.C.—The tender of the Anglo-American Oil Company has been accepted for about 1,400 tons of fuel oil for the Diesel engines for a period of two years. The price is 65s. per ton, delivered at Purfleet.

Plymouth T.C.—In pursuance of the minute passed at the last council meeting, an agreement had been entered into with the Devonport and District Tramways Company for the sale by the company to the corporation of the company's undertaking on Tramway Act terms.

BITUMINISED EARTH PAVING.

An American [illegible] use for about three years at Iola, Kansas. The earth obtained along the road or street, or from any convenient place, is delivered to a portable plant on the ground. In this it is first heated, pulverised and screened. The dust is then raised to a mixing hopper where hot asphalt is admitted in the form of a fine spray, so that the dry dust will absorb it. The quantity and character of the asphalt vary with the character of the earth used.

The mixture is dumped from the hopper into wagons, and distributed upon the roadway, where it is spread to a thickness of about 1½ in. When cool it is rolled with a 5-ton roller. The process is repeated until a depth of about 3 in. has been obtained.

Practically any kind of material that will absorb asphalt can be used. Hard and non-absorbent materials are not suitable, and a sandy loam having a large proportion of coarse, flinty sand would be less suitable than a loam without sand. It is stated that with the absence of hard material or aggregate no expansion joints are necessary, and there is no tendency to crack or disintegrate. The wearing surface is waterproof, but care must be taken to keep the sub-grade well drained.

The first paving at Iola was on a single block in October, 1911. Since then twenty-six blocks of pavement have been laid, the foundation in all cases being the natural soil, well rolled and compacted. Mr. C. E. Stebbins, Commissioner of Streets, has reported favourably on this paving. The cost is said to be from $1·10 to $1·25 per square yard of 3-in. paving.

Women as Scavengers.—Six women have begun work as scavengers at Gateshead, Durham.

Refuse Removal.—In the House of Commons on Wednesday, Mr. Herbert Samuel, President of the Local Government Board, announced that he was about to issue a circular to all urban authorities in England and Wales urging them to do all in their power to [illegible] neighbourhood of dwellings.

Care of Drawing Boards.—A correspondent of an [illegible] of drawing board: Give it a thorough coat of very thin shellac before it has a chance to become warped in the slightest. Use only the very best grade of white shellac, and make it as thin as possible with alcohol, and in brushing it over the surface rub it thoroughly into the pores of the wood, thus making the board thoroughly waterproof. The shellac application should be used over the entire surface. After the board has been used for [illegible] holes, it is a good idea to give it another coat. Do not, however, allow a glossy surface to remain on the board, as it destroys the desired drawing surface; if a glossy surface remains, rub well with plain alcohol. Several such treatments during the life of a drawing board tend to hold it in its original form by keeping moisture from permeating it.

PERSONAL.

Mr. G. A. Waite has been appointed temporary assistant to the city surveyor of Salisbury.

Mr. C. F. Farrington has been appointed engineer to the Conway and Colwyn Bay Water Supply Board, in succession to his father, deceased.

Mr. E. B. B. Newton, M.INST.C.E., F.S.I., borough surveyor of Paddington, has been gazetted to a Second Lieutenancy in the Royal Engineers (T.).

Mr. Felix O'Doherty, assistant county surveyor for North Leitrim, has joined the Royal Engineers. It is understood that his position will be kept open for him.

Mr. W. H. Pearce, surveyor to the Swansea Urban District Council, and the chairman of the Works Committee have been deputed to attend the Road Conference to be held at Westminster in June.

Messrs. E. A. Green, chief building surveyor, Sheffield, and E. J. Hamlin, B.SC., municipal engineer, Stellenbosch, Cape Colony, have been elected members of the Royal Sanitary Institute.

Dr. E. H. Nash, the medical officer of Wimbledon, has volunteered for service with the Royal Army Medical Corps, and has received permission from the town council to go "if his services are urgently required"—as undoubtedly they are already.

Mr. George Horne, sanitary inspector, Paisley, has been appointed sanitary inspector of the county of Sutherland. He was sanitary inspector for two years at Port Glasgow, and six years at Paisley, and he has also acted as clerk of works in various parts of the country. He is a native of Dunbar.

Mr. F. W. Hunt, chief assistant in the valuer's department of the London County Council, was on Tuesday last appointed to the position of valuer, at a salary of £1,500 a year, rising to £1,800 by instalments of £100 every two years. There were twenty applications for the appointment. Mr. Hunt, who passed first in the initial open competitive examination held by the London County Council, was appointed in 1890 to the estates and valuation department constituted under Mr. Andrew Young, under whose direction he learned his profession. He has had practical experience in all its branches, especially rating and assessments, and has been particularly identified with the council's Parliamentary work. In the course of the discharge of his duties he has had first-hand experience of values in every part of the County of London, in some districts in nearly every street. Mr. Hunt is a Fellow of the Surveyors' Institution, a Fellow of the Auctioneers' and Estate Agents' Institute of the United Kingdom, and he has read papers before the Surveyors' Institution.

Permission has been given by the Maldens and Coombe Urban District Council to Mr. Bishop, clerk to the surveyor (Mr. R. H. Jeffes), to join the Army, and it has been agreed to keep his berth open for him, but no action was taken as to augmenting his army pay.

Before the commencement of business at the last meeting of Woolwich Borough Council, the mayor, Alderman H. S. Syer, J.P., referred to the death—reported in our last issue—of Mr. J. Rush Dixon, the borough engineer, and Councillor Dawson proposed that a letter of sympathy and condolence be sent to the widow and family, referring to the admirable manner in which Mr. Dixon had carried out his duties, the esteem in which he had been held, and the sympathy felt with the widow and family. The town clerk expressed the appreciation which the staff had felt for Mr. Dixon, and their grief at his death. He also read a letter from Mr. Baines, the superintendent architect of H.M. Office of Works, expressing great personal appreciation of and indebtedness to Mr. Dixon for the kindness and interest he displayed in the Well Hall housing scheme. He felt his loss as a personal grief. The motion was agreed to by the council standing in silence. Among those who attended the funeral, which, as we have already stated, took place at Plumstead cemetery, were Mr. T. Mundy, the deputy borough engineer; Mr. E. B. B. Newton, borough engineer of Paddington; Mr. J. Sutcliffe, borough engineer of Deptford; Mr. E. Van Putten, borough engineer of Lewisham; Mr. H. C. J. Edwards, borough engineer of Lambeth; Mr. H. E. Anderson, chief assistant, Lambeth borough engineer's office; Mr. R. J. Angel, borough engineer of Bermondsey; Mr. E. Finch, deputy engineer to the Corporation of London; Mr. H. Heckford, borough engineer of Poplar; Mr. T. Cole, general hon. and consultant secretary to the Institution of Municipal and County Engineers; and Messrs. Cooper (Val de Travers, Limited), and F. W. Laws (Patent Victoria Stone Company).

Something Like Gratitude.—The employees of the Llanrwst Rural District Council having been granted a half-holiday on Saturday, the concession was acknowledged in an eloquent letter from the men, from which a simple sentence may be quoted: "The hand of progress and the elevation of mankind were discernible in the council's action, and although it may seem to some but a light matter, the council will have occasion to rejoice to all eternity for the noble part they had taken in the uplifting of the ideals of man's duty to his brother in the flesh. Ever since the result of the discussion had been made known to us, we have with one heart and spirit sang a song of gratitude and appreciation."

See End of Paper.

CORPORATION OF MADRAS.

SPECIAL WORKS DEPARTMENT.

CONTRACT M & M. No. 22 A

The Corporation of Madras is prepared to receive Tenders from competent persons willing to enter into a Contract for the Supply and Delivery of Cast-iron Pipes, Special Castings, Sluice Valves, Hydrants, &c. The total weight of the pipes and special castings is about £4,700 tons, the diameters varying from 2½ in. to 42 in.

Forms of Tender, prepared by J. W. Madeley, Esq., M.A., M.INST.C.E., M.AM.SOC.C.E., &c., Special Engineer, Corporation of Madras, may be obtained from the undersigned on payment of 10s. each, which will not be returned.

Tenders, accompanied by a deposit in currency notes, or a draft on a Madras Bank of Rs.500, should be sent direct to the President, Corporation of Madras, so as to reach him at or before 12 noon on the 14th day of July, 1915.

The Corporation does not bind itself to accept the lowest or any Tender.

JAMES MANSERGH & SONS,
Agents to the Corporation of Madras.

5 Victoria-street,
Westminster.
May 12, 1915. (2,571)

PARISH OF LAMBETH.
BOARD OF GUARDIANS.

The Guardians of the Poor of the Parish of Lambeth hereby invite Tenders for the execution of work in connection with the Painting and Cleaning of their Infirmary and Offices at Brook-street, Kennington, S.E.

Printed Form of Tender, with Conditions annexed, together with Specifications (which alone will be received), may be obtained at this Office on any day (except Saturday) between the hours of ten and five upon payment of £2 in respect thereof, which will be returned to each person sending in a *bonâ-fide* Tender.

The Tenders, which must be sealed and superscribed "Tender for Painting at the Infirmary, &c.," must be sent to the undersigned or placed in the box provided for their reception in the Office of the Clerk to the Guardians, by the tenderers or their representatives, should they so desire, on or before Tuesday, the 8th proximo, and will be opened in the Board Room at 11 a.m. on the following day, when all persons tendering, or their authorised agents, should be in attendance.

The Guardians do not pledge themselves to accept the lowest or any Tender.

(By order)

JAMES L. GOLDSPINK,
Clerk to the Guardians.

Guardians' Board Room and Offices,
Brook-street, Kennington-road, S.E.
May 19, 1915. (2,572)

CUDWORTH URBAN DISTRICT COUNCIL.

The above Council invite Tenders for the construction of Sewage Disposal Works, including Screen Chamber, Detritus Tanks, Liquefying Tanks, Storm Tanks, Percolating Filters, Sludge Beds, Humus Tanks, &c.

Plans, Specifications and General Conditions may be seen, and Bill of Quantities and further particulars obtained, from W. T. Lynam, Engineer and Surveyor, Council Offices, Cudworth, upon the payment of Two Guineas, which will be returned on receipt of a *bonâ-fide* Tender.

Sealed Tenders to be sent to the undersigned on or before Monday, June 7, 1915.

The Council do not bind themselves to accept the lowest or any Tender.

W. T. LYNAM,
Engineer and Surveyor.

Council Offices,
Cudworth. (2,580)

EAST SUSSEX COUNTY COUNCIL.
TO STEAM ROLLER PROPRIETORS.

Tenders are invited for the Hiring of Steam Rollers and Scarifiers for use upon the main roads during the period ending March 31, 1916.

Particulars and Form of Tender can be obtained on application to the undersigned.

Tenders, endorsed "Tenders for Steam Rolling," to be addressed and delivered to the undersigned on or before Monday, the 14th June, 1915.

The lowest or any Tender will not necessarily be accepted.

FRED I. WOOD, A.M.I.C.E.,
County Surveyor.

County Hall, Lewes.
May, 1915. (2,581)

PAIGNTON URBAN DISTRICT COUNCIL.
WORKING FOREMAN WATERWORKS.

Applications are invited for the vacancy of Working Foreman for the Waterworks belonging to this Council.

Applicants must have had at least five years' experience in similar work, be good jointers by cast iron mains, accustomed to repairing and overhauling meters, and to the control of men.

Wages 30s. per week, rising by 2s. 6d. per week at the end of the first and subsequent years to a maximum of 40s. per week.

Applications, in candidate's own handwriting, stating age, previous experience, together with copies (only) of not more than three recent testimonials as to experience, capabilities and personal character, to be sent to the undersigned not later than Tuesday, June 8th.

JAMES A. HUTCHINSON,
Assoc.M.Inst.C.E., &c.,
Waterworks Engineer and Manager.

Town Hall, Paignton.
May 18, 1915. 2,575

URBAN DISTRICT OF FINCHLEY.
TEMPORARY ENGINEERING ASSISTANTS.

The Council of the above-named District require the services of Two Temporary Engineering Assistants in the Engineer's and Surveyor's Department, at a salary of £120 per annum each.

Candidates must be competent Levellers and Surveyors, and good Draughtsmen, and must have had twelve months' experience in a municipal engineer's office.

Form of application may be obtained from the Engineer and Surveyor at the undermentioned address.

Applications, addressed "Temporary Assistant," accompanied by three recent testimonials, must be delivered to the undersigned by not later than 12 o'clock noon on Monday, the 7th of June, 1915.

Canvassing, either directly or indirectly, will be deemed a disqualification.

E. H. LISTER,
Clerk of the Council.

Council Offices,
Church End,
Finchley, N.
May 20, 1915. (2,574)

DISEASE TRANSMISSION BY FLIES.

WARNINGS TO LOCAL AUTHORITIES.

In the House of Commons Mr. Boland asked the President of the Local Government Board what steps, if any, had been taken to inform the public as to the danger to health involved in the transmission of disease by flies under existing war conditions; whether any leaflets on the subject had been published, and, if not, whether a leaflet published by the Zoological Society of London would be utilised, and whether steps would be taken to set up a small Committee to deal with the subject.

Mr. Herbert Samuel said the board had issued seven reports on "Flies as Carriers of Infection," and they had, during the last few years, warned local authorities by circular, at the beginning of the summer, of the dangers of allowing accumulations of refuse, which might form breeding-grounds for flies, to remain in the neighbourhood of dwellings. They had for some time past been urging individual local authorities who were not dealing satisfactorily with the refuse of their districts to improve their methods. In a circular letter which was about to be issued attention would again be drawn to the matter. The War Office and his department were co-operating in this, as in other matters affecting the health of the troops and of the civil population. A number of local authorities had issued posters and leaflets on this subject. He was considering the preparation and issue by the Local Government Board of a series of model leaflets on this and other health subjects, which local authorities could use if they so desired. He really thought it necessary to appoint a committee.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

NORTHWICH MEETING.

A North-Western District meeting is to be held at the Council Offices, Northwich, on Friday, May 28th.

PROGRAMME.

11 a.m.—District executive meeting.
11.30 a.m.—District meeting.
Reception in the council chamber by the chairman of the council, Mr. Councillor Worsley, J.P.
District business.
Paper by Mr. J. Brooke, engineer and surveyor, on "Municipal Works of Northwich," which will be taken as read.
Discussion.
12.45 p.m.—Visit to baths.
1 p.m.—Lunch at Lion and Railway Hotel (tickets 3s. each).
2 p.m.—Leave Lion Hotel.
2.15 p.m.—Arrive Marston salt rock mine.
3 p.m.—Leave Marston salt rock mine.
3.20 p.m.—Arrive Anderton Lift.
4 p.m.—Leave Anderton lift.
4.15 p.m.—Arrive swing bridge.
4.30 p.m.—Leave swing bridge.
4.35 p.m.—Arrive sewage pumping station.
4.50 p.m.—Leave sewage pumping station.
5.20 p.m.—Arrive Cote Brook waterworks.
6 p.m.—Leave Cote Brook waterworks.
6.15 p.m.—Arrive Blue Cap Hotel (tickets for tea 2s. each).
7.20 p.m.—Leave Blue Cap Hotel.

Tickets for motor char-à-banc 2s. 6d. each.

It is necessary that the nationality of persons attending this meeting should be declared.

A. W. BRADLEY, M.INST.C.E.,
Hon. District Secretary.

St. Helens.

SOUTHALL MEETING.

A meeting of the Eastern District will be held at the Town Hall, Southall, on Saturday, June 5th.

PROGRAMME.

2 p.m. Meet at Town Hall, Southall.
Business.
Read minutes of previous meeting.
2.30 p.m. Proceed by motor omnibus (fare 1s. 6d. each)—
(*a*) To visit open-air bath:
(*b*) Through Osterly Park to inspect sewage disposal works.
4.30 p.m.—Return to town hall to tea, kindly provided

by the engineer and surveyor, Mr. Reginald Brown, M.INST.C.E.

5.15 p.m.—Discussion of works inspected, and papers by Mr. Reginald Brown (member), "Fourteen Years' Municipal Work in a London Suburb," and Mr. J. H. Edmondson, F.C.S., "Fitting up and Working of a Sewage Works Laboratory."

Conveyances for the various visits have been arranged, tickets 1s. 6d. each.

J. A. WEBB,
Hon. District Secretary.

Great Stanmore.

AYR MEETING.

The annual Scottish District meeting of the institution will be held at Ayr on Friday and Saturday, June 4th and 5th next.

PROGRAMME.

Friday, June 4th.

11 a.m.—Business meeting in County Hall, County Buildings, Ayr.

11.30 a.m.—Discussion on the following papers:—
"Suggested Town Planning Details for Scottish Conditions," by John Bryce, M.INST.C.E., Office of Public Works, Glasgow, with criticisms by some members of the Town Planning Committee of the Scottish District.
"Pressure Scraping 15 miles of Water Mains," by James McFadzean, B.SC., ASSOC.M. INST.C.E., assistant burgh engineer, Ayr.

1 p.m.—Reception by the Ayr County Road Board and the provost and magistrates of Ayr in the County Hall.

1.15 p.m.—Luncheon in the Lesser County Hall, County Buildings, kindly provided by the County Council of Ayr.

2.30 p.m.—Discussion on the following papers:—
"Road Work," by R. Drummond, C.E., county road surveyor, Renfrewshire County Council, Upper District.
"Description of Experimental Stretches of Road Laid in the Ayr District, Ayr County, and Meteorological Station in Connection Therewith," by Allan Stevenson, C.E., county road surveyor, Ayr County Council, Ayr District.
"Municipal Housing," by Wm. A. Macartney, ASSOC. M. INST. C.E., burgh engineer, Johnstone.

4.15 p.m.—MUNICIPAL WORKS, &C., TO BE VISITED.
(1) Visit to refuse destructor, electricity station, hospital extension, pavilion and esplanade, tar-macadam roads, &c.

(2) Visit to Burns Monument and cottage, by kind invitation of the Corporation of Ayr.
Tramway cars will leave town hall at 4.15 p.m., arriving back at 6.30 p.m.
Tea will be served in the tea gardens at 5 p.m.
NOTE.—The time allotted will only permit of members visiting one of the above.

7.30 p.m.—Annual Dinner in Station Hotel. Tickets, 7s. 6d. each.

Saturday, June 5th.

VISIT TO EXPERIMENTAL STRETCHES OF ROAD AND METEOROLOGICAL STATIONS IN THE AYR DISTRICT, AYR COUNTY, HILLHOUSE QUARRY AND TROON.

9.45 a.m.—Motor chars-à-banc will leave Station Hotel at 9.45 a.m. prompt, and proceed to the experimental stretches of road, Hillhouse Quarry, and Troon.

1 p.m.—Luncheon (kindly provided by the Hillhouse Quarry Company) will be served in the South Beach Hotel, Troon, at 1 o'clock, after which the return journey will be made to Ayr, arriving at 2.30 p.m.
Tickets for motor chars-à-banc, 3s. 6d. each.

CIRCULAR TOUR BY MOTOR CHAR-À-BANC TO LOCH DOON, VIA PATNA AND DALMELLINGTON, FOR NESS GLEN.

2.30 p.m.—Motor char-à-banc will leave Station Hotel at 2.30 p.m., arriving back at 6.40 p.m.

5 p.m.—Tea will be served at Dalmellington at 5 p.m. Ticket for motor char-à-banc and tea, 8s. each.

6.50 p.m. Trains leave Ayr Station for Glasgow at 6.50 p.m.

Mr. Young, burgh engineer, Ayr, has kindly offered to arrange for ladies present being well looked after during the meetings on Friday forenoon and afternoon; and also on Saturday forenoon.

DAVID A. DONALD,
Hon. District Secretary.

Grangemouth.

MATLOCK MEETING.

The arrangements for the institution meeting to be held at Matlock on June 12th include visits to the new sewage works, the brine and electric baths, and other undertakings.

J. W. DUDLEY ROBINSON,
Secretary.

INSTITUTION OF MUNICIPAL ENGINEERS.

EASTERN, NORTH-EASTERN AND SOUTH-EASTERN DISTRICTS.

A meeting of these districts will be held at Dunstable on Saturday, May 29th.

PROGRAMME.

1.30 p.m.—Reception at the town hall by his Worship the Mayor of Dunstable, Mr. F. T. Garrett, J.P.

2 p.m.—Leave town hall by conveyance. (Approximate cost of conveyance, 1s. 6d. per head.)

2.15 p.m.—Arrive at sewage disposal works.

3 p.m.—Leave sewage disposal works.

3.10 p.m.—Arrive at gasworks.

3.30 p.m.—Leave gasworks, and proceed on foot to Maiden Bower (old British camp), onward by Green Way (old British road) to Totternhoe Knolls (old British and Roman camps). Inspect cottages erected by the Luton Rural District Council at Totternhoe.

4.30 p.m.—Proceed by conveyance to waterworks, &c.

5.20 p.m.—Tea at Dunstable, by kind invitation of the Mayoress.

Descriptive notes on the various undertakings and inspections will be given by Mr. W. F. Wilkins, borough surveyor, Dunstable, and Mr. H. Pickering, surveyor, Luton Rural District Council.

Trains leave Luton (G.N.R., adjoining M.R. Station) for Dunstable at 12.20, 1.5 and 1.30, and Leighton Buzzard (L. & N.W.R.) for Dunstable at 12.25.

Trains leave Dunstable for Luton at 6.15 and 7.25, and for Leighton Buzzard at 6.5 and 8.13.

G. BELSON CHILVERS,
Hon. District Secretary.

COUNCIL MEETING.

The next meeting of the council will be held in London on Wednesday, May 26th, at 5.30.

B. WYAND,
39 Victoria-street, *Secretary.*

Municipal Employees and War Service.—A committee of Great Yarmouth Town Council, following a scrutiny of the list of men in the corporation employment, have instructed the borough engineer, Mr. J. W. Cockrill, to intimate to twenty-eight men eligible for enlistment or employment in armament work that the time had arrived for them to answer their country's call. Their wages would be made up and their places kept open. Forty-six out of 120 men on the staff of the tramway manager have already joined the forces, and thirteen other men are to be called upon to offer their services. Twenty out of sixty-four men on the staff of the borough electrical engineer have gone, and the chief of the department does not think he has left more than one man whom he could ask to serve. The borough engineer is to reinstate for the period of the war any workmen over seventy years of age recently placed on the retired list who are capable of doing efficient work.—Replying to a question in the House of Commons last week, Mr. Herbert Samuel said he had no information of the improper refusal of local authorities to allow their employees to join the Army, but if any such cases were brought to his notice he would make inquiry into the matter. Answering a further question, Mr. Samuel said he feared it was impossible to make an estimate of any value of the number of men of military age—excluding those engaged in work essential to public health—who were still employed by county and municipal authorities in the British Isles.

ASSOCIATION OF MANAGERS OF SEWAGE DISPOSAL WORKS.

WIMBLEDON MEETING.

On Saturday, May 29th, a visit will be paid to the Wimbledon sewage works and the S.O.S. works, Durnsford-road, Wimbledon, near Wimbledon Park Station (District Railway).

Members are invited to meet at 3 p.m. at pumping station, Durnsford-road, to view the pumping plant, lime mixing plant, filters and sludge pressing plant, the [illegible] by the Hydro-Aero-Extractor Co., Ltd., and the recovery of fats resulting from such treatment. Afterwards an inspection will be made of the S.O.S. works, and the products resulting from the destructive distillation of sewage sludge.

ROYAL SANITARY INSTITUTE.

SHREWSBURY MEETING.

Mr. H. Percy Boulnois, M.Inst.C.E., will occupy the chair at a meeting of the Royal Sanitary Institute, which is to be held at the Guildhall, Shrewsbury, on Friday, May 28th, when lectures will be delivered on Modern Methods of Refuse Disposal, the Purification of Water, and [illegible] by Dr. D. Thomas Orr.

The proceedings will commence at 7.0 p.m.

On the following morning an inspection will be made of the Shrewsbury housing scheme, Ditherington, [illegible] and the corporation abattoir. The members will be entertained to luncheon [illegible] by the mayor.

BRISTOL MEETING.

On June 11th, at Bristol Guildhall, a conference on "Co-ordination of Military and Civil Sanitary Services in War-time," will be opened by Dr. D. S. Davies, medical officer of health, and Mr. L. S. McKenzie, [illegible] city engineer.

APPOINTMENTS VACANT.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* WEDNESDAYS *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1056) subject to later confirmation by letter.*

ROAD FOREMAN.—May 24th.—Northwich Rural District Council. 32s. per week. Mr. J. [illegible], clerk.

FOREMAN.—May 28th.—Cannock Urban District Council. 35s. per week.—Mr. Robert Blanchard, engineer and surveyor.

BOROUGH SURVEYOR'S GENERAL ASSISTANT.—May 29th.—Corporation of Burton-upon-Trent. £100 a year.—Borough Surveyor.

CHIEF INSPECTOR OF NUISANCES.—May 29th.—Corporation of Plymouth. £170—£230.—Mr. O. Hall, medical officer of health, Town Hall.

SURVEYOR.—May 31st.—Llanfrechfa Urban District Council. £146 per annum.—Mr. William Clark, clerk, 44 Coronation-road, Cwmbran, near Newport, Mon.

SURVEYOR'S ASSISTANT.—May 31st.—Corporation of Beverley. £65 per annum. Mr. J. Gould Smith, borough surveyor, 31 Lairgate, Beverley.

ENGINEMAN.—June 1st.—Weybridge and Oatlands Joint Sewerage Committee. 35s. per week, with cottage, light and coal.—Mr. John S. Crawshaw, surveyor, Council Offices, Weybridge.

SURVEYOR AND INSPECTOR.—June 1st.—Seaham Harbour Urban District Council. £200 per annum.—Mr. J. W. Richardson, clerk.

SURVEYOR AND WATER ENGINEER.—June 8th.—Bridgwater Rural District Council. £250—£325.—Mr. T. M. Read, clerk, Rural District Council Offices, Bridgwater.

INSPECTOR OF NUISANCES.—June 14th.—Colwyn Bay Urban District Council. £150 per annum.—Mr. J. Amphlett, clerk.

DISTRICT SURVEYORS (2).—June 18th.—London County Council.—The Clerk, County Hall, Spring-gardens, S.W.

TEMPORARY CLERK.—Corporation of Cheltenham.—Borough Engineer, Municipal Offices, Cheltenham

MUNICIPAL CONTRACTS OPEN.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* WEDNESDAYS *to ensure their inclusion in the weekly list of summaries. Buildings.

CHORLEY.—May 25th.—For alterations to the discharge block and painting, for the Chorley Joint Hospital Board.—Mr. R. E. Stanton, clerk.

UXBRIDGE.—May 25th.—For the erection of a lavatory, for the urban district council.—Mr. W. L. Eves, surveyor, 54 High-street, Uxbridge.

KENT.—May 26th.—For the execution of repairs to schools, for the Education Committee.—Mr. W. H. Robinson, architect, Sessions House, Maidstone.

ISLE OF WIGHT.—May 26th.—For repairs and other work to a bridge, for the rural district council. Mr. L. A. Cozens, surveyor, Walmer Villa, Castle-road, Newport, I.W.

LEYTON.—May 27th.—For the erection of a temporary fire station, for the urban district council.—Mr. E. H. Essex, surveyor, Town Hall, Leyton, Essex.

SHEFFIELD.—May 28th.—For excavations and concrete work, for the Electric Supply Committee.—Mr. S. E. Fedden, engineer and general manager, Commercial-street, Sheffield.

CANNOCK.—May 28th.—For the construction of conveniences, for the urban district council.—Mr. R. Blanchard, engineer.

DEVON.—May 29th.—For alterations to certain schools, for the Education Committee.—The Architect, 1 Blackall-road, Exeter.

HASTINGS.—May 31st.—For the erection of band-stand and covered shelters, for the corporation.—Mr. P. H. Palmer, borough engineer.

DEWSBURY.—May 31st.—For the erection of buildings in connection with the Whitley Sanatorium, for the corporation.—Borough Surveyor, Town Hall.

STAMFORD.—June 4th.—For the erection of twenty-four houses, for the corporation.—Mr. F. R. Ryman, borough engineer, Town Hall.

DUNDEE.—June 4th.—For making reinforced-concrete floors and jointless flooring at generating station, for the corporation.—Mr. H. Richardson, general manager and engineer, Electricity Department, Dundee.

GRIMSBY.—June 5th.—For alterations to "Rutland House," for the rural district council.—Mr. J. F. Wintringham, St. Mary's Chambers, Grimsby.

SOMERSET.—June 5th.—For carrying out sea defence works at Blue Anchor, near Minehead, for the county council.—Mr. Edward Stead, county surveyor, Wells.

GREENOCK.—June 15th.—For the erection of 150 houses, for the corporation.—Office of Public Works, Municipal Buildings.

Iron and Steel.

WIGAN.—May 26th.—For the supply of electricity cable, transformer and switchgear, for the corporation.—Mr. J. Slevin, borough electrical engineer, Bradford-place, Wigan.

PORTSMOUTH.—June 1st.—For the supply of tram rails, fishplates and iron tiebars, for the Tramways Committee.—Mr. V. G. Lironi, engineer, Fratton-grove, Portsmouth.

MANCHESTER.—June 2nd.—For the supply and erection of coal-unloading crane, and conveying plants, for the Electricity Committee.—Mr. F. E. Hughes, secretary, Electricity Department, Town Hall.

MADRAS.—July 14th.—For the supply of cast-iron pipes, special castings, sluice valves and hydrants, for the corporation.—Mr. J. W. Madeley, special engineer; agents, Messrs. James Mansergh & Sons, 5 Victoria-street, Westminster, London, S.W.

RANGOON.—August 11th.—For the installation of a system of fire alarms, for the municipality.—Messrs. Ogilvy, Gillanders & Co., 67 Cornhill, London, E.C.

Roads.

PONTYPRIDD.—May 24th.—For carrying out road improvements at Llantwit-road, for the urban district council.—Mr. W. E. Lowe, engineer and surveyor.

PONTYPRIDD.—May 24th.—For the execution of road improvements, for the urban district council.—Mr. W. E. Lowe, engineer and surveyor.

ILFORD.—May 24th.—For making up certain roads, for the urban district council.—Mr. H. Shaw, engineer and surveyor.

EASTBOURNE.—May 24th.—For private improvement works, for the corporation.—Mr. A. E. Prescott, borough surveyor.

GATESHEAD.—May 25th.—For paving a street, for the corporation.—Mr. N. P. Pattinson, borough engineer.

ASHTON-UPON-MERSEY.—May 25th.—For laying granite tarred macadam, for the urban district council.—Mr. F. Hutton, surveyor.

GATESHEAD.—May 25th.—For paving a street, for the corporation.—Mr. N. P. Pattinson, borough engineer.

BOGNOR.—May 26th.—For the supply of 150 tons of ¾-in. Leicester or Guernsey granite chippings, for the urban district council.

FELTHAM.—May 26th.—For the supply of 10,000 gallons of refined tar (Road Board Specification, No. 1), for the urban district council.—The Surveyor.

MARTLEY.—May 26th.—For the supply of 150 tons of granite, 450 tons of slag, 900 tons of granite, 300 tons of slag, and 200 tons of granite, for the rural district council.—Mr. H. L. Richardson, surveyor.

ASHFORD.—May 27th.—For the supply of 1,710 cub. yds. of 2-in. gauge broken granite and 320 cub. yds. of ¾-in. gauge granite chippings, for the urban district council.—Mr. W. Terrill, surveyor.

STOWMARKET.—May 27th.—For the supply of granite and flints, for the urban district council.—The Surveyor.

OLDHAM.—May 27th.—For making up certain streets, for the corporation.—Borough Surveyor.

ROWLEY REGIS.—May 31st.—For work of tar-spraying, for the urban district council.—The Surveyor.

WANTAGE.—May 31st.—For the supply and hauling of hand-picked stones and rubble, for the rural district council.—Mr. J. H. Robinson, surveyor, East Ilsley.

FINCHLEY.—May 31st.—For making up part of a road, for the urban district council.—Mr. C. J. Jenkin, engineer.

ELY.—May 31st.—For the supply of machine-broken Leicester granite, for the urban district council.—Mr. W. McKelvie, surveyor.

TILBURY.—May 31st.—For the supply of 10,000 gallons of approved refined tar, complying with the Road Board Specification No. 4 for Tar No. 1, also laying 1,000 sq. yds. bituminous-bound granite (graded), 1,000 sq. yds. of tarred slag macadam, and 1,000 sq. yds. of tar-paving, for the urban district council.—Mr. S. A. Hill-Willis, engineer and surveyor.

FINCHLEY.—May 31st.—For making up Holly Park, for the urban district council.—Mr. C. J. Jenkin, engineer.

PONTYPOOL.—June 2nd.—For the supply and hauling of limestone, for the rural district council.—Mr. R. O. Roberts, district surveyor, Usk.

WESTMINSTER.—June 10th.—For the execution of paving works and the supply of wood blocks, for the city council.—Town Clerk.

DURHAM.—June 11th.—For the supply of about 12,000 tons of granite cubes and other size granite setts, for the county council.—Mr. Albert E. Brookes, county surveyor, Shire Hall, Durham.

LEWES.—June 18th.—For road rolling and the supply of 600 tons of 2-in. broken granite and 600 tons of broken surface-picked flints, for the corporation.—Borough Surveyor.

Sanitary.

FINCHLEY.—May 31st.—For the construction of soil and surface-water sewers, in connection with the Woodhouse estate workmen's dwellings scheme, for the urban district council.—Mr. C. J. Jenkin, engineer and surveyor.

Stores.

MANCHESTER.—May 26th.—For the supply of materials, for the Electricity Committee.—Mr. F. E. Hughes, secretary, Electricity Department, Town Hall.

BELFAST.—May 27th.—For the supply of stores, for the Gas Committee.—Engineer and Manager, Gas-works.

Miscellaneous.

WORCESTERSHIRE.—May 28th.—For sale, a 12½-ton roller by Aveling & Porter, also Morrison's patent road scarifier.—Apply, Mr. C. F. Coleridge, county surveyor, 30 Foregate-street, Worcester.

TENDERS FOR MUNICIPAL WORKS OR SUPPLIES.

The Editor invites the co-operation of SURVEYOR *readers with a view to making the information given under this head as complete and accurate as possible.*

* Accepted. † Recommended for acceptance.
‡ Provisionally accepted.

DEVON.—For repairs and alterations to certain bridges, for the county council.—Mr. W. P. Robinson, county surveyor, Exeter:—

Paddon Bridge.

C. Duke, Plymouth	£129
E. Harris, Exeter	127

Yarty Bridge.

R. G. Spiller, Chard, Somerset	£232
E. Harris, Exeter	187
E. G. Coles, Taunton †	170

Axe Bridge, Hawkchurch.

E. Harris, Exeter	£190
R. G. Spiller, Chard, Somerset	179
E. G. Coles, Taunton	131

KIRKCALDY.—For the construction of a concrete toe at the loupin wall in Kinghal bay, for the corporation.—Mr. R. Henderson, harbour engineer, Edinburgh.

G. Smith & Sons, Kirkcaldy	£468
A. Fraser, Kirkcaldy	268

PONTARDAWE.—For the supply of cast-iron water mains, with valves, for the rural district council.—Mr. J. Morgan, engineer.

J. D. Howells, Brynamman	£342
P. Clarke, Pontardawe	314
D. Griffiths, Ynysmeudu	255
E. J. Hanney, Swansea	229

ROTHERHAM.—For the supply of stoneware pipe sewers, for the rural district council.—Mr. B. Iles, engineer.

Wand & Atkinson, Rotherham, £535.

SWANAGE.—Accepted for providing materials and labour for tar-spraying, for the urban district council.—Mr. W. H. Pearce, surveyor:—

H. V. Smith & Co., Westminster, London, 2d. per yard super.

EALING.—For the durchold drainage scheme, for the urban district council.

W. Jackson, Forest Gate	£1,612
Economic House Drainage and Repair Company	997
J. C. Turner, Blackwater, Hants	980
— Iles, Wimbledon	908
G. W. Pedrette, Leicester	899

CANNOCK URBAN DISTRICT COUNCIL.
FOREMAN.

The above-named Council invite applications for the post of Foreman for part of the District.

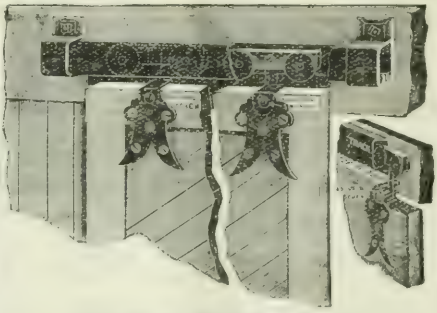
Applicants must have had experience in the control of men for Street Scavenging, Watering, Road Making, Tarmacadam, Spraying, Paving, &c., and be able to undertake the inspection of Sewers, Drains, and Buildings.

Wages 35s. per week.

Applications, in candidate's own handwriting, to be addressed to the Chairman of the Council, Council Offices, Cannock, and endorsed "Foreman," must be delivered not later than noon on Friday, the 28th of May, 1915.

ROBERT BLANCHARD,
Engineer and Surveyor.

May 13, 1915. (2,574)



No door is too big, too small, or too awkwardly placed

to be hung on Coburn Track. The brackets are supplied in shapes and sizes suitable for doors of any weight in any position.

The roller-bearing runners move without friction in the round trough track, and the doors slide easily **always**, because the working parts do not become clogged with dirt, or rusty, being protected by the covered track.

COBURN ROUND TROUGH Steel Tracks

Coburn Track is cheap, and easy to fix, and we shall be pleased to give information by return of post on the best methods of hanging sliding doors.

Minutes of Proceedings.

Manchester Corporation and "Unfit" Property.

A judgment of considerable interest and importance has been given recently by the House of Lords on the question of property that is alleged to be "unfit for habitation." The appeal was by a property owner against the Corporation of Manchester with respect to the proposed action of that authority under sec. 11 of the Manchester Act of 1867. The section places the corporation in what is virtually the position of arbitrator to determine judicially whether a building is or is not unfit for human habitation, with an appeal to Quarter Sessions. The chief point discussed in the judgment was the term "unfit for habitation," customarily used in connection with municipal authorities, and with respect to it the Law Lords, Lord Dunedin, Lord Parker, and Lord Sumner, indulged in some very ingenious deductions. Lord Dunedin described the phrase as "a very elastic expression," and altogether different from "not up to modern or model requirements," though what these latter may be he refrained from saying. If, he argued, the term is applied to a house as a whole, "it must mean the most and every thing is unfit . . . a result which, in the debate is worth 1 vote but 1 he could regard as conveying being arrived at when there are rooms with window [illegible] a yard." Lord Parker sought to improve upon this by contending that if the corporation wished to decide whether a house was unfit for human habitation, "reference must necessarily be made to some standard of fitness or unfitness," and he added that "the fact that the corporation [illegible] a certain standard of fitness which they desire to impose on the area subject to their jurisdiction, and that the building in question falls short of that standard, will not, in my opinion, necessarily render the house unfit within the meaning of the section."

These intellectual subtleties, when viewed in relation to each other, would appear to lead us into something very like a literary morass. We are not thereafter rescued from such an unpleasant position, but rather plunged deeper into the mire when we find his lordship saying further: "The standard to be applied would seem to be that of the ordinary reasonable man. This test may seem vague, but it will be found quite sufficient except in cases on the border line, and in such cases the corporation will proceed at its own risk, and must expect litigation." Lord Sumner discussed the matter interrogatively, asking among other things if a house which had been fitly inhabited for over half-a-century could be unfit for human habitation; and again, Was it unfit even though the backyard, with or apart from adjacent buildings, provided scanty ventilation or light to a [illegible] or a staircase window, the living-rooms being well lit and well ventilated? These speculations and questionings would seem to prove that local authorities who have so long and so freely made use of the term "unfit for habitation" in the endeavour to obey the law have undertaken a responsibility which is vastly greater than they bargained for.

Failures in Concrete.

The importance of the study of failures [illegible] in engineering practice can hardly be over-estimated, and it was therefore with great interest that we read an excellent article in the May issue of our contemporary *Ferro-Concrete*, in which the causes of failure in reinforced work were examined and the methods to be adopted for avoiding them were discussed. It is [illegible] that every failure in concrete work is due either to inadequate design, inferior materials, or bad workmanship. Hence the supreme importance to the building owner of securing the services of a thoroughly competent designer, and of having the work carried out by experienced workmen under the supervision of an expert contractor. So far as reinforced concrete is concerned, there have been very few actual failures in this country, but these and the more numerous mishaps which have occurred abroad point to certain definite causes of failure. Chief among these are inadequate design, misplacement or omission of reinforcement, bad material or workmanship, insufficiency of moulds or centering for temporary support, and the premature removal of such moulds or centering. The last mentioned is by far the most frequent cause of failure, but represents a mistake not at all likely to be made by experienced contractors. Inadequate design may result from lack of experience, and is most unfortunately encouraged by the pernicious system of inviting competitive designs. Errors in the application of reinforcement and in the preparation and placing of concrete are obviously preventable by efficient

supervision on the part of the contractor and the clerk of works or resident engineer.

One particularly suggestive characteristic feature of reinforced concrete work is that no failures have been known to occur after the completion and hardening of the concrete. This point constitutes definite proof of the fact that the comparatively few mishaps so far recorded have been the result of errors or carelessness in construction. Equal proportions of stone, brick, timber and steel structures have failed during or immediately after construction for similar reasons. Moreover, many structures of these classes have collapsed at varying intervals after completion, and as the result of gradual decay. On the other hand, the history of reinforced concrete gives the assurance that when a properly designed and carefully built structure has once been completely finished it is perfectly safe, and will go on increasing in strength and durability from year to year.

* * *

Dry Closets. In our issue of April 16th last we made some plain comments on the endorsement of the dry closet system by the Royal Commission on Sewage Disposal, as expressed in their Ninth Report. We then pointed out that, although theoretical considerations might warrant the use of the earth closet and the ashpit privy, the abominations which invariably accompany their adoption in practice are such as to render it almost impossible to believe that the suggestion that the system applied to a large village would meet with the approval of the Royal Commission. On this point, however, the report leaves little, if any, room for doubt. For example, we are told that "a system of dry closets may be open to little objection," and that "in small communities the removal of the contents may generally be left to the householder," while "in larger villages it may with advantage be undertaken by the local authority." The article to which we have just referred concluded with a suggestion that it would be of general interest if those of our readers whose experience included the extensive use of earth closets or of privy ashpits would communicate their opinions on this very important matter. In response to that invitation we have received a vigorously worded communication from a rural district surveyor, whose only complaint of our former comment is that it was couched in terms which were too moderate for the occasion. The principle underlying our contributor's contentions is that there is but one standard of cleanliness, which is just as necessary—indeed, more so—for the cottage dweller and his family than for the cottage owner. Even if it be granted that the earth closet and ashpit privy are model sanitary appliances if properly used, there are two great facts which render them only too frequently insanitary in practice. One is the prevailing popular ignorance of the danger to health of [illegible] accumulations, and the other is the impossibility of securing that continuous and unremitting care on the part of every user which is essential if proper conditions are to be preserved. Hence the force of our correspondent's paradoxical proposal to give the flow a good fall from the back wall to the sill, so that the filth may temporarily cause as much personal nuisance as possible by running under the feet of the user from the leaky and overflowing pan. If it were possible, as in all cases, to prepare a separate block plan of every house and its outbuildings in a small typical village, showing the methods of water supply and drainage, together with statistics of sleeping accommodation, sanitary defects and other matters affecting the health of the occupants, we believe that the results would surprise even the most ardent sanitary reformer.

Surveying and Field Work.* This, the latest addition to the many published works on "Surveying," is one of the useful series of "The Glasgow Text-books," of which Prof. G. Moncur, B.Sc., M.Inst.C.E., the Professor of Civil Engineering in the Royal Technical College, Glasgow, is the editor. A practical knowledge of surveying and levelling forms the groundwork for all civil and municipal engineering work, such as sewerage or waterworks, roads, bridges, and other constructional works, and this book offers safe guidance on the subject to the students and pupils for whom it is primarily intended. It is simply and clearly written, and well illustrated with 270 specially prepared plates, and though it does not deal with the more advanced forms of geodetic surveying and astronomical work, it contains all the practical information on the subject of surveying that the majority of practising engineers and surveyors are likely to require.

The chapters on chain surveying are of a very complete and practical character, though the author, like so many other writers on the subject, falls into the mistake of relying on two lines for ties for offsets where three are required for accuracy. The necessity of ties for offsets for fences is not very apparent, as they are generally plotted to a small scale, and where it is necessary to fix the corners of a house or an important junction a third line prevents any danger of mistake in plotting. Plus signs should be given where offsets or measurements are not running measurements, figures outside the hatching of the houses should be clearer, and a double line for the survey lines frequently avoids confusion of offsets with measurements. Town surveying might with advantage have been more fully treated, as this branch of surveying is to most engineers of greater importance, and presents more difficulty than country work. The 1/2500 Ordnance plans are practically kept up to date by revision by the Ordnance Survey authorities, but they do not now revise the 1/500 plans without payment from the municipal authorities, and the work consequently falls on the borough engineer's staff. The book contains much useful information on traversing, levelling, contouring, setting out of curves, and calculation of areas, and it will be a valuable addition to any engineer's library.

The Use of Lime Concrete. In 1909 a paper on the use of lime concrete in the East was presented to the Concrete Institute by Mr. E. A. W. Phillips, M.Inst.C.E., a former superintending engineer to the Burma Public Works Department. The object of this paper was to show that the introduction of a proportion of Portland cement to lime concrete as made in India and Burma has a material effect in hastening the setting to an extent depending on the proportion of cement added. This paper recently came under the notice of Mr. H. Kempton Dyson, who was so impressed with the importance of the questions raised that he took steps to secure the carrying out of a series of experiments for the purpose of testing the accuracy of the assertions made by Mr. Phillips. The experiments were actually carried out by the last-named gentleman, and the results are embodied in a further paper which was read at a meeting of the Institute held last week. In his concluding remarks the author points to the desirability of still further experiments, and expresses the opinion that, if carefully carried out, the results would undeniably encourage the employment of cement to improve lime concrete at comparatively small cost. It appears that

* By James Williamson, Assoc.M.Inst.C.E. Price 7s. 6d. net. London: Constable & Co., Limited.

cement has been employed for this purpose in India ever since Portland cement was first manufactured, and that the results have been entirely satisfactory. For example, between 1871 and 1875 Mr. Harcourt, the engineer charged with the construction of the Ravi Bridge and other works in connection with the Punjab Northern Railway, employed Portland cement, mixed with local lime in various proportions, in order to expedite the setting of the mortar. Unfortunately, he preserved no records as to the exact materials used, but his evidence goes generally to confirm the conclusions arrived at by Mr. Phillips. In undeveloped countries cost alone usually precludes the use of cement in large quantities, and the use of mixtures is therefore a practical necessity. This being so, Mr. Phillips's experiments are valuable as tending to substitute a scientific basis for the rules of thumb which have hitherto prevailed.

* * *

Incendiary Fires. Some useful and practical suggestions for coping with outbreaks of fire caused by incendiary bombs from aircraft are put forward in a memorandum which was issued last week by the British Fire Prevention Committee. The committee point out that the various fire brigades cannot be expected successfully to deal with any large number of outbreaks, and that their attention would in any case be primarily devoted to fires affecting Government offices and shipping engaged on Government work, military stores, docks and hospitals, and so forth, rather than to private property or semi-public property, however valuable. In their opinion, therefore, it behoves all owners and occupiers of such premises to do their best to organise for self help. Innumerable establishments, such as factories, warehouses, stores, modern office blocks, flats, hotels, and large private houses, as also semi-public establishments like schools, baths, theatres, music halls and assembly rooms, are equipped with internal hydrant services and first-aid fire appliances. These, it is suggested, should be promptly examined, and the staffs—both male and female—frequently practised in handling the gear. Unskilled establishments, such as shops, offices, and ordinary domestic buildings, should have an ample supply of buckets kept ready filled with water—and where funds permit, one or more small hand pumps. Occupants should be taught to use these appliances efficiently. Every effort should be made by the public to assist the fire brigades in their onerous duties, but they should not call on any account immediately to notify by telephone or otherwise, any outbreak that comes to their notice. The method of calling assistance to be posted up in a conspicuous position. In any event, the British Fire Prevention Committee consider the public would be well advised to have these matters attended to at once, and should remember that fires caused by incendiary bombs, if promptly tackled with water in fair bulk, forecasts a calamity, need not spread, and are not quite the terrifying peril to be dealt with that the enemy would make them.

* * *

The War and Appointments. We have already called attention to the hardship which may be imposed upon those officials who have answered their country's call, by reason of the fact that for the period of the war they are precluded from making application for new appointments. The Local Government Board have now issued a circular containing suggestions, the effect of which will incidentally be to mitigate this hardship, although their primary object is to prevent the appointment, for the time being, of young men of military age. The suggestion made by the board is that whenever vacancies occur, and it is unlikely that candidates suitable for permanent appointment who are not eligible for the Army or for special work in connection with the war can be obtained, the local authority should consider first whether it would be possible by a rearrangement of duties among other officers to avoid any fresh appointment during the period of the war; and that if this should be found impracticable, they should endeavour to secure the services of any retired officer with the requisite experience who might be able and willing to act during that period; or failing this should engage persons temporarily, who are not eligible for the Army or the special occupations, as recommended in the previous circular in the case of substitutes. The board recognise that persons so engaged may not always possess the same standard of qualification as would be required in the case of permanent appointments, but this difficulty may be overcome if it is made clear to them when engaged that the employment is only temporary, and that permanent appointments made after the war will be subject to all the ordinary conditions.

* * *

Forthcoming Meetings. From now until the end of June there will be no lack of meetings of professional societies, though it must be admitted that fixtures are not quite so abundant as in previous years. At Shrewsbury this evening there is every promise of a most instructive discussion on the value of the mechanical filter in the purification of water, the occasion being, as we announce elsewhere in this issue, a meeting of the Royal Sanitary Institute. To-day, also, the North-Western District of the Institution of Municipal and County Engineers meet at Northwich, where, in addition to the customary descriptive paper—which Mr. J. Brooke, the engineer and surveyor to the district council, will submit—the proceedings will include an interesting round of visits to municipal and other works. Next Saturday will see two further meetings of the same body, one at Southall, Middlesex, and the other at Ayr. It will be the institution's second visit to the historic Scottish town, and a glance at the excellent programme will make it clear that the gathering is likely to prove a strong attraction to Northern members. The Institution of Municipal Engineers and the Association of Managers of Sewage Disposal Works are meeting to-morrow at Dunstable and Wimbledon respectively; and among other important arrangements for the near future are the summer meeting of the Institution of Water Engineers—which, owing to the war, is to take place in London instead of at Belfast as originally intended—the annual meetings of the Institution of Municipal and County Engineers and the Town Planning Institute, and the opening of the National Road Exhibition.

North Riding Main Roads. The report of the county surveyor, Mr. W. G. Bryning, upon the main roads of the North Riding of Yorkshire for the year ended March 31st, which was presented to the council recently, refers to the effects of the war upon road works, caused by the shortage of men, horses and materials. The increase in the motor-car traffic, Mr. Bryning proceeds to state, is undoubtedly very large, and, as previously reported, the water-bound macadam on the principal main roads is found to be expensive and unsuitable, as it is rapidly broken up. It is most desirable for efficiency and economy that the amount of bound material put down should be greatly increased, and that the surfaces of the best sections of water-bound macadam should be tar-sprayed to prevent them being disintegrated under this traffic.

Municipal Buildings, Gourock.

The selected design for the new municipal buildings at Gourock, which we illustrate herewith, is that of Mr. Alexander N. Paterson, M.A., A.R.I.B.A., 266 St. Vincent-street, Glasgow.

The site at the corner of a place [illegible] the main part open on one side to the Esplanade and Clyde, and a somewhat narrow street leading out of it southwards. The short front faces the former, while along the latter an extended but very narrow block has been acquired, rather more than one-half of which is to be utilised at present.

The accommodation required consisted of a council chamber, with the usual municipal offices of limited dimensions, and a burgh court room, together with lettable subjects in the form of premises for the local estate office, the parish council, shops, and three and four roomed houses. A tower was also suggested, but the sum allowed under the conditions (£7,000) was already quite insufficient for the provision of the required accommodation without such a desirable adjunct.

The position of the court room was fixed in relation to the police buildings to be erected alongside. The council chamber, as giving the only opportunity for architectural development and emphasis in elevation, appeared to call for the most prominent situation on the angle of the building. From this, with the necessity of some feature to mark the centre of the front, as ultimately to be extended, the arrangement of the plan and the design generally, including the style adopted, seemed to develop naturally.

The design was placed first in a limited competition by the assessor, Sir John J. Burnet, and, having been accepted by the town council, is now developed on larger lines to meet additional requirements, with a view to an early commencement of the building.

Gourock Municipal Buildings.

LIME CONCRETE IN THE EAST.*

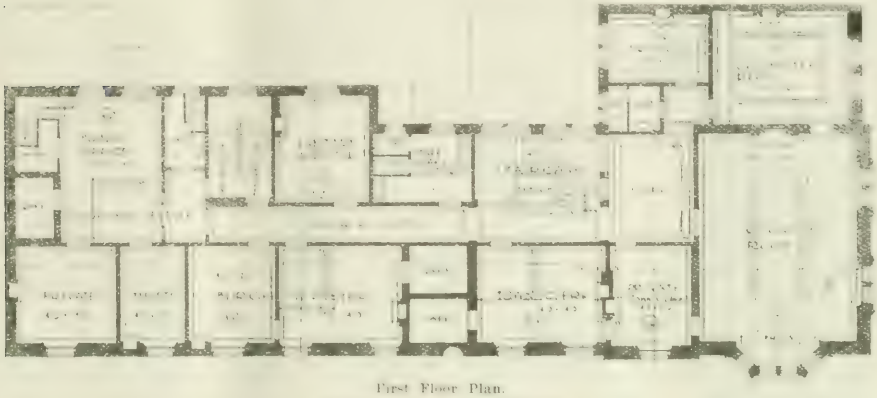
By E. A. W. Pettitt, M.Inst.C.E., M.I.

[illegible] confidence in the material. To enable it to set under water [illegible] "Soorkhee," the [illegible] not know exactly how much soorkhee is required by each kind of lime, and this ignorance is due to the want of scientific laboratory tests of the kind so frequently made in Europe. It seems no advantage to send lime and soorkhee to England to be tested, since the difference in climate, the sea voyage, and the lapse of time in transit might vitiate the results. Conservative Indian opinion, based on long experi- [illegible] with 1 part of [illegible] lime and 1 part of sharp, clean sand, all measured in bulk, dry. The materials are thoroughly incorporated and ground in a mortar mill, either under one wheel pulled round a circular track by a bullock or in a pan machine under a pair of wheels. The mortar should be a thick reddish paste, in which the particles of lime cannot be distinguished by the naked eye. A mortar made in this way sets very well indeed in still water, but it sets comparatively slowly, and some engineers (the author included) add, when necessary, a proportion of Portland cement to the mixture. The introduction markedly hastens the setting to an extent depending on the proportion of the cement to lime; 1 part cement to 1 part lime by volume sets apparently as quickly as cement mortar. In the early stages of setting the strength of the concrete is much increased, admitting of early handling and removal of moulding boards. The addition of cement preserves soorkhee mortar in wet foundations from the evils of percolation, and the cement besides seems to have a chemical effect on the lime, fixing the particles and aiding in a more solid set.

First-class soorkhee mortar, several centuries old, it has been asserted, exceeds Portland cement mortar, 1 to 3, in strength and impermeability, and is said to be often equal to 1 to 2½. In regard to economy, there is no comparison in Rangoon, cement costing [illegible] about two rupees per cubic foot and lime only three-tenths of a rupee per cubic foot. Further, in comparing the two classes, it has to be remembered that, while native Indian masons are very clever in dealing with lime, they often make bad mistakes in dealing with Portland cement, and have to be specially taught its use, and carefully watched besides, as they are stupidly stubborn.

Where a mortar mill cannot be obtained, or when the work is too small to justify the expense, stone lime is thoroughly slaked by being steeped for twenty-four hours or a week or more in fresh water, being kept constantly covered and stirred at intervals with a rod. The result is a perfectly slaked lime and a breaking up of all but the very hard particles. The wet lime is first mixed very thoroughly with the sand, the particles of the sand tending still further to break up and subdivide the lime. Soorkhee, very finely hand-pounded and screened, is then added in small quantities, and if the operation is properly done it should be a little difficult to detect that the mortar has not been prepared in a mill. This is the best native Indian practice when a mill cannot be got. Tradition asserts that the stone lime in the Taj Mal of Agra was steeped in water nearly a year before use.

The author then gave a description of a number of experiments which had been made by himself and others as to the effect of adding lime to Portland cement in making mortars and concretes—namely, as to the effect upon the setting time of cement, the tensile strength of the mixture, the effect of lime in increasing the resistance to percolation of water through cement mortar, and the crushing resistance to concretes and mortars made with varying proportions of cement and lime. Some of the results [illegible] with a small proportion of Portland cement and added lime and crushed brick. The author pointed out the advantage of employing lime in the East where carriage upon Portland cement increases its cost very greatly. The conditions that prevail everywhere in rough, undeveloped lands rendered the matter of the highest importance that cements can be utilised as described. The author urged that further investigations were desirable because of the absence of reliable tests. At present we are working in the dark by rule of thumb.



First Floor Plan.

* Abstract of paper read at the last meeting of the Concrete Institute.
† "Soorkhee" in India is finely powdered red brick.

Fire at Middlesbrough Baths.—Between £1,000 and £2,000 damage was caused by fire at the Middlesbrough Corporation Baths on Monday.

Mechanical Haulage.—Mr. E. F. Willson, surveyor to the Kingsbridge (South Devon) Rural District Council, will be glad to receive information from surveyors to other rural councils who have adopted a system of haulage of materials by mechanically propelled vehicles.

Road Maintenance at Skegness.—In his report for 1914 the engineer and surveyor to the Skegness Urban District Council, Mr. R. H. Jenkins, states that at the end of the year there were 7 miles of highway repairable by the town, and that the total cost of maintenance was £771, or about £110 per mile. Mr. Jenkins remarks that the expenditure on this work was curtailed on account of other extra and pressing necessities, but the strain on the roads becomes greater each year, and on account particularly of the weak foundations of many of the older highways in the town the surfaces quickly collapse if not repaired at the proper time. The surface-tarring of the roads has been extended from 39,258 yds. coated the previous year to 77,040 yds. during the year under review, but there are still considerable lengths of road which, Mr. Jenkins thinks, should be treated as soon as possible. The total cost of this work was £280.

Glastonbury Sewage Works.*

By A. P. I. COTTERELL, M.INST.C.E., Engineer to the Scheme.

The Glastonbury Corporation have constructed three settlement tanks on their farm at Cradlebridge, together with storm-water sludge lagoons and irrigation area.

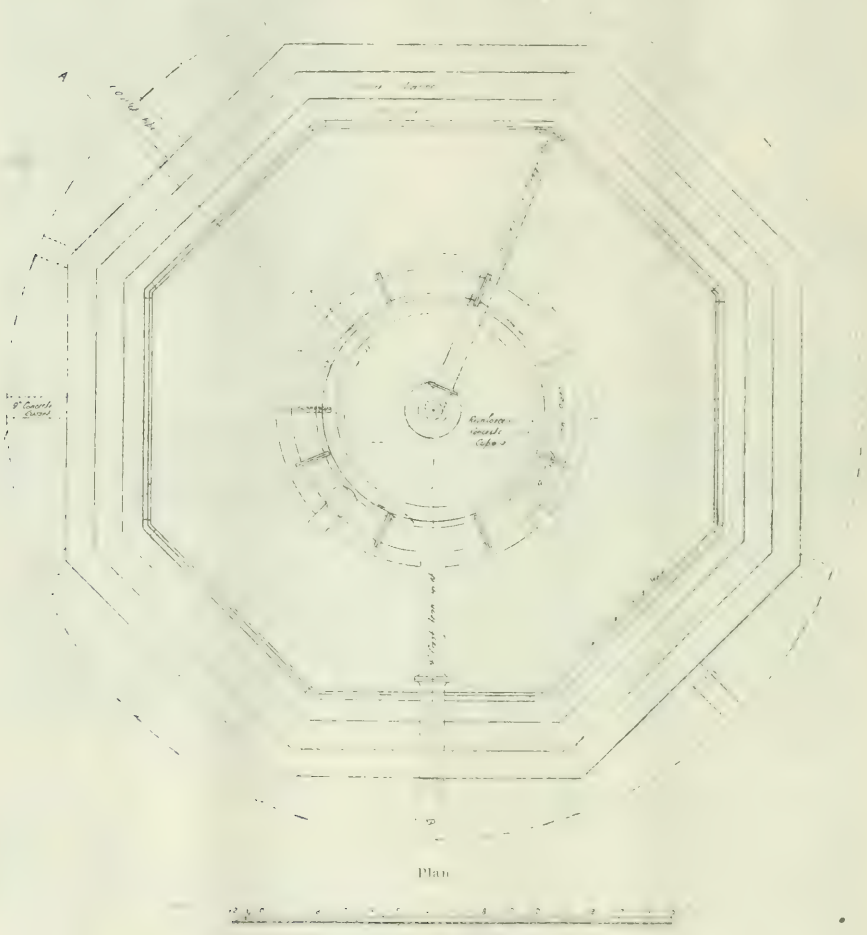
Each tank has a capacity of 26,666 gallons, and is built of concrete. It is designed on the sludge-digestion principle—viz., with an inner septic chamber and a vertical flow annular settling tank. Great difficulties were experienced in the construction, the peat being at least 30 ft. deep, and no solid foundation obtainable. Each tank was sunk as a concrete monolith with a cutting edge, the ground being excavated from inside, and as it dropped the monolith was added to above. The bottom is in soft slurry that constantly rose in the excavation like very viscous syrup.

On reaching the required depth a rough plank floor was quickly put in, stiffened by steel joists against the upward pressure. A concrete moulded centre was then inserted and the concrete base constructed, the water being meanwhile kept down by pumps. The tanks are now floating in the moor.

At Porchestall Drove it was at first intended to insert a circular concrete storage tank of 75,000 gallons, but the work had to be abandoned for the same reason as above named.

Three concrete caissons, each 15 ft. diameter, were substituted, and they have been sunk to a depth of 42 ft., where a solid clay bottom was found. Each tank is connected at the base, and inside one of them is an inner chamber which contains the pumps. The engine-house is built on top of the tanks.

An inverted syphon, over 2,000 yds. in length, runs from the town to Cradlebridge. The Porchestall tank is at its lowest part, and will be utilised both for the low-level area of Glastonbury, near the station, and for cleansing the syphon. From the Porchestall tank the sewage is pumped over a standpipe into the western end of the syphon.



Plan

GLASTONBURY SEWAGE WORKS.

New sewers have been laid in the Northover area draining to Porchestall. Difficulty was experienced in laying the outfall sewer through the peat, but it was overcome by constructing it in cast-iron with turned and bored joints.

The pumping machinery at Porchestall is in duplicate, each set consisting of a [illegible] engine, driving by means of belt drives a 4-in. Stereophagus pump. These pumps are of the centrifugal type, and are so designed that they are capable of pumping unscreened sewage. A [illegible] with

* Presented at a meeting of the Somerset Surveyors' Association at Glastonbury on Saturday the 15th inst.

gearing is provided, so that each pump can be driven by either or both engines as desired.

There is a further pumping station at Northload, serving a population of about 250. The sewage gravitates to a storage tank at this station, and is pumped therefrom through a 6-in. rising main into the high-level sewers. The storage tank is circular, 22 ft. 6 in. diameter and 10 ft. deep, built of concrete with a brick lining. The engine-house is similar in design to that at Porchestall, and is built directly over the storage tank.

The machinery at Northload is also in duplicate, and each set consists of a 4·5-b.h.p. gas engine, driving a 2-in. Stereophagus pump with belt drives and countershafting, as at Porchestall.

The total population served by the works is about 4,000, and the cost of their construction has been £11,541.

DRY CLOSETS—SO CALLED.

By A RURAL DISTRICT SURVEYOR.

Your leader of April 16th is none too strongly worded, and were I master of the English language I would pen a paragraph in a much more lurid strain.

The hopelessness—the helplessness of a sanitary inspector, conscious of being the servant of a set of smug farmers and small owners, they in turn being the cringing tools of the larger owners of property, who repeatedly ignore the strongest possible reports as to the foul, bestial conservancy system of deliberately storing all fæcal matter sometimes within 6 ft. or so of the kitchen door or larder window, is positively humiliating.

One finds these closets in all sorts of places, abutting on the dairies, kitchen chimneys (thus encouraging fermentation), and the larder, and, at a higher level, with the urine from the leaky pans impregnating the walls, and even flooding the floors where the food and baby's milk are kept.

With a sufficient drain, sewer and water supply available, it is positively wicked deliberately to hinder the officer from serving the necessary notices, and it is not fair to those ratepayers who have paid their shot in the construction of a sewer and water main, and who still have to pay their share of scavenging these filthy holes and pans.

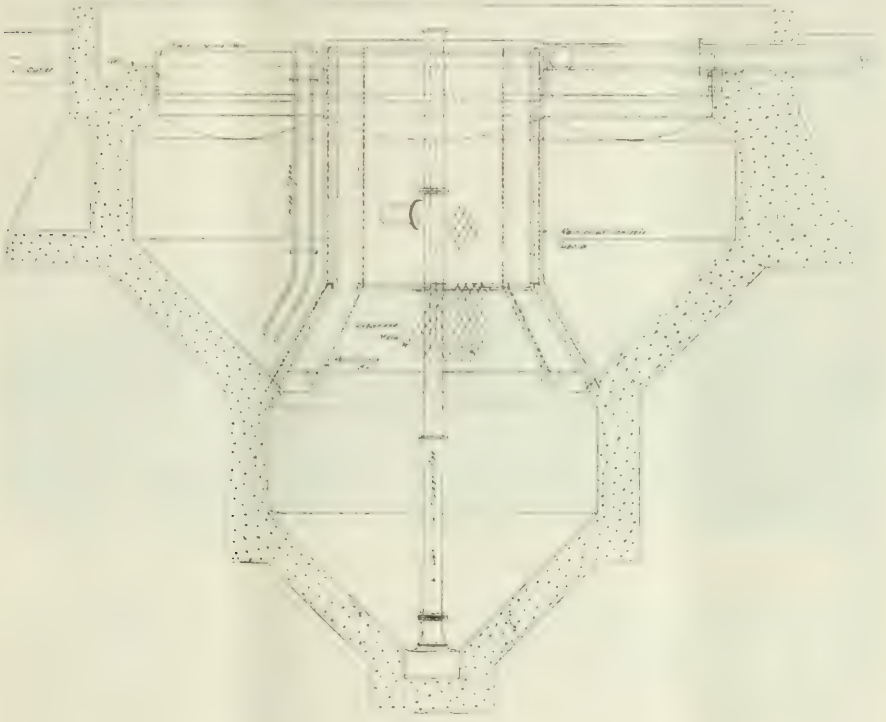
Pan closets, or "dry" closets, forsooth! Not one in a hundred is there that is dry; rather does one find 25 per cent in such a state that the stuff slops over and splashes the men who are obliged to handle it.

It is, thank goodness, more and more difficult to get men to take on this work, and may the time soon come when no man will be obliged, or found willing, to undertake such foul work when it can be avoided.

"Serve a notice on the tenant" is utterly useless where no scavenging scheme exists, and where, therefore, the tenant may be responsible, for before the necessary formalities are completed the vile thing has been emptied and is again half full.

Not one person in one hundred attempts the admixture of dry earth or ashes to the contents of the closet.

Where the writer does give a hint on the construction of pan closets it is—"Give the floor a fall of ¼ in. to the foot, from the back wall to the sill."



Section A B.

GLASTONBURY SEWAGE WORKS.

If constructed with a recess in the floor with a trap door at the back, as illustrated in Model by-laws, many would never trouble to empty it, as long as the stuff got away somehow, no matter where.

If no proper water supply is available to furnish the necessary flushing from a cistern, do it with a pail, anything to get rid of it rather than to have it handled. . . .

I wonder how many of the commissioners having residence in the area of a rural authority use pan or earth closets? A fairly long experience has taught me that the rural councillors usually have a water-closet of some kind on their premises wherever possible. By all means cast all public health work on the county council, or, better still, the Local Government Board or a Board of Health, if such a body

will encourage its officers to remove the festering cancer from among us.

There is but one standard of cleanliness, and that is just as necessary—indeed, more so—for the cottager and his family than for the owner of the cottage.

If, as is so often the case, the owner becomes financially incapable of maintaining his property in a reasonable condition, the sooner the local authorities, the county council, or the Local Government Board step in and assume ownership, at a valuation, the better and cheaper for the community at large.

The waste of time in this one branch of routine work is alarming. An abstract from the sanitary inspector's work, as published in the annual report of a Midland county medical officer of health, shows 8,467 nuisances arising from ashpits and privies, with the consequent entries in notebook, journal, letters and revisits reaching, in some cases, 33 per cent of the total work on this one subject, which should be practically automatic.

The men who hold the reins even go so far in the systematic and continuous effort to curb the ardour of their officer as to propose and second a wordy, vapoury minute that, where garden ground is available (little or much, and garden paths included), no steps shall be taken to enforce the alteration of existing closets, and were not the clerk to advise them that such a resolution would have no effect, and they cannot restrain the sanitary inspector, the minute would be carried unanimously: so the chairman politely calls the officer's attention to the manifest feeling of the Bumbles, and sagely advises him that it may be best for him to meet their views.

If he be ardent, enthusiastic, efficient, sure of his ground, and has committed no great indiscretions around his district, he will still threaten, cajole and jockey many owners into doing the necessary work, and disregard the consequences as long as he gets the work done somehow. That he suffers for it no one doubts, and no one knows that better than himself, for even sanitary inspectors do occasionally ask farmers and small builders for slight additions to a pitiful salary, or for the provision of a second-hand push bicycle, or the maintenance thereof.

There is, of course, the satisfaction of feeling that he is improving the lot of general humanity; there is also one other satisfaction—the thanks, often many months after, but rarely forgotten, of a grateful cottager for a nuisance removed, and of which he or she has not dared to mention to the squire, or, worse still, his autocratic agent, for fear of a polite but frigid intimation that the cottage was "required next month for a new tenant."

For the tenant, more often than not, is charged with sending for the sanitary inspector, and the repudiation, backed by a pathetically written appeal to the officer to substantiate a negative, is only half believed.

To obviate the cruel wrong, every house in the land should be officially visited once every two years, instead of, as is now sometimes the case, but once in a lifetime, and no void house should be reinhabited without a certificate from the sanitary authority, which should not, in my opinion, be the local one—unless the public health officer be first given the security of tenure.

It has long been in the writer's mind to prepare a separate block plan of every house and its outbuildings, in a small typical village, showing water supply drainage, ashpits, &c., number of bedrooms and their cubical contents, together with a card system recording the cause of every death, case of infectious disease, drain obstruction, date of visits, and sanitary defects discovered; but youthful ardour is gradually squeezed out of existence by the routine working of a 90 square mile district single handed, to say nothing of the deliberate invitation of one's paymasters to use green spectacles.

ALEXANDRA SCHOOL, HOUNSLOW.

The Alexandra School, Hounslow, is the second school which Mr. J. G. Carey, Assoc.M.Inst.C.E., the engineer and surveyor to the Heston and Isleworth Urban District Council, has designed for the Education Committee of that body. The first school (the Central Schools, Isleworth), erected in 1910, at a cost of £8,000, was a departure from the central hall type, and the committee, for whom Mr. Carey acts as architect and surveyor, were very pleased with the design and the result. In the present instance the committee have every reason to congratulate themselves, as Mr. Carey has designed a school which obtains for the teachers and scholars the best possible conditions under which to prosecute their studies.

The school is of the quadrangle type, and is, we believe, the first of its kind in Middlesex. The leading idea in the planning was to secure natural cross ventilation to the classrooms, and to form a sheltered space for open-air teaching and for physical exercise. Cross ventilation has been secured to all the classrooms, in the case of two classrooms [illegible] two external walls, this [illegible]

(*Mr. J. G. Carey, Assoc.M.Inst.C.E., Architect.*)

New School at Hounslow.

by ventilating through dormer windows over the roof of the corridors. A sheltered space for open-air teaching and for physical exercise is provided for by the quadrangle. The assembly hall, which forms one end of the quadrangle, is isolated from, although adjoining the classrooms. This is much appreciated, as the use of the hall for educational or other purposes does not interfere with the work of the scholars in the several classrooms.

The provision of a medical inspection-room with waiting-rooms is an innovation, and has enabled the Education Committee to establish a school clinic for the treatment of ringworm and ophthalmia cases.

The elevations of the buildings are mainly in grey stock brickwork, with blue brick plinths, red brick and artificial stone dressings; the front elevation, which includes the administrative offices, is built in silver grey facing bricks with reliefs as before described, and the general result of the architecture, while not in any way lavish or expensive in treatment, is very pleasing, and forms a notable addition to the public buildings in Hounslow.

The schools provide for 840 scholars (420 boys and 420 girls), and the cost is £13,000, for the whole of the school buildings, playsheds, latrines, fencing, playgrounds, caretaker's house and contingent works, which were very considerable owing to the difficulties of the site—which also demanded the construction of a foul-water sewer for the purpose of drainage.

The [illegible] works was Mr. W. [illegible], of Hounslow, and the heating system was carried out by Messrs. Kite & Co.

THE SURVEYORS' INSTITUTION.

PROFESSIONAL EXAMINATIONS, 1915.

The following candidates have passed in the Final Examination:—

Messrs. B. C. Adkin,* Bromley, Kent; A. M. Aldous,† Putney, S.W.; W. W. Berry, Kingston Hill, Surrey; F. Burdass, Beverley; A. de M. Chesterman, Bath; M. V. Davies, Aberystwyth; D. Evans, Meifod, near Welshpool; T. J. Evans, Porthcawl; W. C. Evans, Port Talbot; H. Fayers, Watford; H. E. Gillett, Highgate, N.; W. F. Gurney, Dartmouth Park, N.W.; H. P. Haggett, Newport, Mon.; W. Hill,¶ Egremont; G. S. Jennings, Moseley; H. D. Johnson, Middlesbrough; H. W. Lindsley, Sunderland; A. D. Longley, Beckenham; I. W. Morgan, Brecon; A. Morwood, Sidcup; E. J. Phillips, Bedford; R. Pollard, Accrington; T. Raddall, Callington; S. M. Sawyers, Newcastle-on-Tyne; J. Scott, Winchmore Hill, N.; E. G. Shoosmith, Bedford; A. E. Smith, Plumstead, S.E.; P. D. Sturge, Bristol; R. T. K. Thomas, Leeds; E. J. C. Vint, Aspatria; P. W. Walley, Frankton, near Oswestry; T. H. Walter, Forest Hill, S.E.; H. E. Whorwell, Dover.

* Beadel Prize. † Special Prize. ¶ [illegible]

The following non-students have passed in the Intermediate Division:—

Messrs. J. H. Alden, Hull; E. C. Annakin, Beverley; E. A. Arblaster, Sutton Coldfield; H. B. Bagley, Ipswich; G. W. Baker, Treorchy; H. P. Barnes, Usk; F. Baxter, Stanmore; R. D. Bennett, Wallington; C. E. Berry, Leytonstone, E.; H. B. Bescoby, Hastings; W. E. Blackett-Ord, Earl's Court, S.W.; R. L. Bland, Hammersmith, W.; T. H. Bletsoe, Thrapston; P. T. C. Body, Reading; G. BITUMEN.

To the Editor of The Surveyor

Sir,—From your report of Mr. Nandy Hoskins's paper, "Asphalt and its Application in Sanitary Work," read before the Institute of Sanitary Engineers, it is interesting to learn that Mr. Delano was very rightly recognised as an authority on asphalt, and, as Mr. Hutchinson remarked, "no one could take priority of Mr. Delano" in the discussion that followed.

The fact is apparently clear that there are, as you have kindly allowed me to state on many occasions through your columns in the past, authorities on asphalt and bitumen in this country who could have furnished the necessary information that would have enabled Colonel Crompton and his committee to publish the true and correct classification and definitions of asphalt, bitumen, petroleum pitch, &c., without seeking advice or approval from America.

Mr. Delano, I believe, has had very extensive experience both in this country and on the Continent, but I understand Colonel Crompton's committee—whose proceedings, you stated in your "Minutes of Proceedings," January 23, 1914, were "conducted in private"—did not consult or hear Mr. Delano's views on the subject.

In view of Colonel Crompton stating as far back as 1913 that it was his intention, and that of those associated with him, to confer with certain American engineers, and as a result of their united action to obtain the classification of petroleum pitch as "bitumen," I have referred to some of the writings of Mr. Delano on asphalt and bitumen to ascertain whether he was of the opinion that petroleum pitch should or should not be described as "bitumen," and Mr. Delano, I notice, distinctly states in a paper he read before the Institution of Civil Engineers that "mineral bitumen should not be confounded with the residuum of crude petroleum," and that "asphalt and bitumen are natural products."

I might also quote the opinion of Mr. D. A. Sutherland, F.I.C., F.C.S., another eminent authority on asphalt and bitumen, who states that "bitumen is a natural product, as opposed to bituminous products obtained as the result of destructive distillation or by other artificial means."

Petroleum pitch is, of course, the residuum from the distillation of petroleum oil in the same way as coal-tar pitch and other pitches are obtained by distillation, and if any one kind, such as petroleum pitch, is entitled to the term "bitumen," then the same must apply to coal-tar pitch and all others—a suggestion which is, of course, ridiculous.

The objection to the term "petroleum pitch," and the object of describing this as "bitumen" has never been explained, but I am strongly of the opinion that there is sufficient evidence to prove that bitumen has always been understood to refer to a natural product, and that petroleum pitch is not entitled to this term any more than any other form of pitch.—Yours, &c.,

A. E. H. Dunseb.

Bromley-by-Bow.
May 20, 1915.

Town Planning Institute.—The annual meeting of this body has been fixed for the afternoon of Wednesday, June 23rd.

THINGS ONE WOULD LIKE TO KNOW.

(Contributed.)

Apropos of the statement of the chairman of the Royal Automobile Club at the recent annual meeting of that body that the names of 200 alien enemies had been removed from the list of members since the war broke out, should not this excellent example be followed by other societies, and by a certain engineering institution in particular? Is there no courage or patriotism left in the council of this institution?

* * * *

Should not the discussion on mechanical water filters which will take place at Shrewsbury this evening, under the auspices of the Royal Sanitary Institute, be of considerable interest? Is it not remarkable to observe the progress which has been made in recent years on the old types of mechanical filters, and is it not to be hoped that the discussion will tend to a definite opinion as to which is the best and most economical method to pursue?

* * * *

Why is it that in this country we have not been very successful in our concrete road building, whereas in the United States many hundreds of miles of this material have been constructed with considerable success? Is it because we are too sparing of the cement, or do we not get the right material as a matrix, or is it because we cannot keep the traffic off the face of the concrete long enough to let it set properly? Or what is the cause of failure? The American engineers appear to attach considerable importance to the provision of sufficient and reliable expansion joints; do we properly understand the proper placing of these joints?

* * * *

Do we not all sympathise with Mr. J. W. Orde, the secretary of the Royal Automobile Club, who lost his son, Lieut. H. W. J. Orde, R.N., by the sinking of the "Goliath" in the Dardanelles? Is not this death a loss, not only to him, but to the country, as Lieutenant Orde was a brave and skilful officer, who had gained the D.S.O. only a few months before his death by his distinguished bravery during the fight at Dar-es-Salaam?

* * * *

Was it not rather remarkable that the Local Government Board, and not the Institution of Civil Engineers, should have sent a circular letter to consulting engineers asking them for information as to how the war had affected their practice, and, if there was a slackness of work, in what way it could be ameliorated? Would not one have thought that the proper body to take this action would have been the great mother institution of all consulting engineers, and not a Government Department? Does the council of the institution quite realise their responsibilities to their members?

Pudloed Cement.—We are informed that the concrete water tower recently erected at Stafford has been lined with Pudloed cement with perfectly satisfactory results.

Southsea Pier to be a Military Hospital.—Portsmouth Corporation have decided to turn Southsea Pier into a temporary military hospital in response to the War Office request that the town should provide accommodation for 500 men.

Bournemouth Front Improvements.—The mayoress, Mrs. James Druitt, on Wednesday declared open to the public the new shelters, cliff paths, and terraces which have recently been constructed by the Bournemouth Corporation at a cost of several thousand pounds on the sea front at the Boscombe end of the Undercliff-drive and Marine-parade.

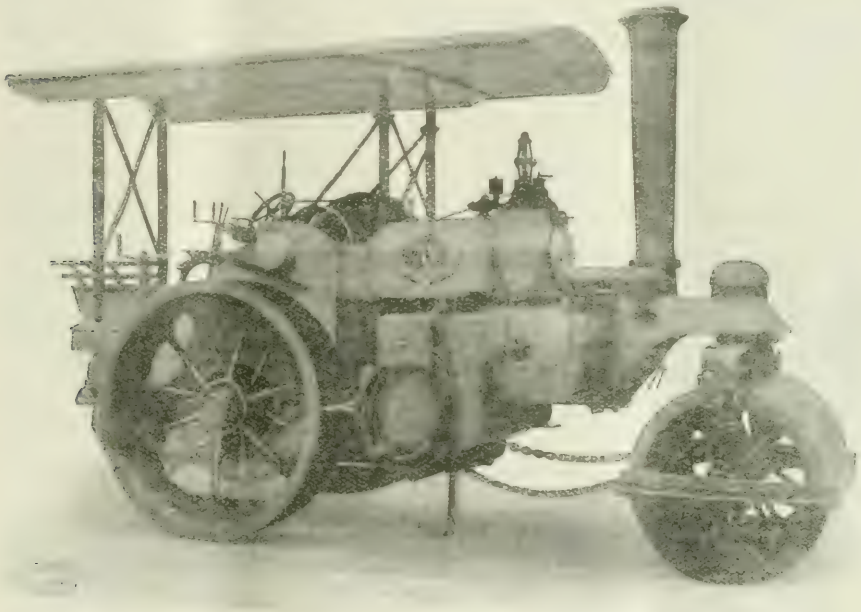
Loch Lomond Road Improvement.—The Western District Committee of the County Council of Dumbarton have completed the work of improving the second section of Loch Lomond-road. The carriageway has been increased from a minimum width of 11 ft. 6 in. to 16 ft. Formerly the road was carried over the Douglas Water on a bridge 48 ft. 6 in. span and 12 ft. wide. Now the bridge is 20 ft. wide, and the addition is built on a curve of 180 ft. radius, thereby doing away with the sharp bends. The cost of the undertaking has been borne by the county authorities and the National Road Development Trustees.

"MARSHALL" CONVERTIBLE ROLLER-TRACTOR.

We have pleasure in giving an illustration and description of a successful type of roller-tractor which is manufactured by Messrs. Marshall, Sons & Co., Limited, Gainsborough, Lincs. This convertible engine is built in accordance with well-established modern practice, and, as the result of actual working experience extending over two or three years, it is claimed that the engine is a thoroughly practical type, and quite free from those inherent defects which often militate against the convertible roller-tractor in one or even both of its capacities.

As a roller, its weight (empty) can be arranged to be 6 or 8 tons, according to the weight of the road rollers with which it is fitted; and as a steam tractor it makes a haulage engine economical in operation and well suited for the transport of road materials.

The motion mechanism is erected on a well-proportioned boiler of the locomotive-multitubular type. The firebox of the boiler is an exclusive "Marshall" patent and has a [illegible] crown plate. The peculiar shape of this crown considerably retards the formation of scale, and the improved circulation of the water [illegible] the [illegible] and [illegible] is claimed to be always maintained at its maximum efficiency, even at times when the use of dirty feed water is unavoidable.



The power transmission is arranged on the three-shaft principle, and a four-pinion differential or compensating gear is usually supplied, as thereby the engine steering is much improved, the main axle relieved of stresses, and the wear on the road wheels, or rollers, is considerably reduced. The transmission gear has machine-cut teeth, except in the last motion, and runs in an oil bath.

The cylinder casting, either simple or compound type, is erected on a pressed steel mounting riveted to the boiler barrel. The piston, crosshead, connecting rod, link motion, crankshaft, and crankshaft-bearing details are conveniently and compactly devised, and a positive-action oil pump of the "Manzel" pattern is fitted for lubricating the cylinder interior and slide valve faces. A geared-down feed pump, automatic feed-water injector and water lifter are fitted to requirements, and ample accommodation is provided for storage of water and fuel.

When the engine is destined for considerable employment on haulage the makers fit a winding drum and a simple system of spring mountings, but this equipment is optional on a convertible roller, except in cases where, when converted to a hauling engine, it is worked as a steam tractor under the Heavy Motor Car Order, and in that case spring mountings are a legal stipulation.

The arrangements for quick conversion are carefully designed. On reference to our illustration it will be observed that a flanged bolted joint with machined faces in contact is provided between the boiler barrel and smoke-box. The latter part, with the fork and front rollers, can be readily removed, and replaced by a smoke-box, undergear and road wheels of the usual tractor type. The hind or driving wheels are also easily exchanged for road wheels, thus providing, with a few hours' work, an exceptionally serviceable engine which will be equally efficient for road rolling or haulage.

The haulage of road materials by steam tractors has been proved by many road authorities to be a far more economical method than horse haulage, as may be witnessed by the large number of steam tractors now employed by councils and contractors. We have recently seen some convincing statistics compiled from daily records by a surveyor which show that an enterprising Midlands urban council saved over £275 [illegible] was used by them, as compared with the combined cost of horse haulages and inevitable steam roller hire charges, previously incurred. To cite a typical case of the reliability of the roller-tractor used in the latter capacity, one of these engines was employed hauling for a large road repairing contract. During a period of seven months, 7,000 tons of granite were hauled, involving an aggregate of 7,500 miles travelled. The work, which was that of a give-and-take nature, and at times over heavy roads, was accomplished without the disclosure of a single mechanical fault, a fact which speaks well for the sterling qualities of the materials and the workmanship of the engine.

The convertible appliances are obtainable at a moderate cost, and, given that the local conditions demand a fair proportion of road rolling and haulage work, an engine which can, at short notice, be operated either as a roller or a tractor is quite an economical proposition, and well worth consideration for a near future when shortage of manual labour is certain to be in evidence, and labour-saving appliances will be a marked necessity.

The Littleton Reservoirs.—The Metropolitan Water Board have accepted for the construction of a portion of the Littleton reservoirs a tender amounting to £673,212.

Law Notes.

The Editor will be pleased to answer any questions affecting the practice of engineers and surveyors to local authorities. Queries (which should be written legibly on foolscap paper, on one side only) should be addressed to "The Editor," at the office of THE SURVEYOR, *accompanied by the writer's name and address, but correspondents who do not wish their names to be published should also furnish a "nom de plume." Where necessary, copies of local Acts or documents referred to should be enclosed.* All explanatory diagrams must be drawn and lettered in BLACK ink only, and in such style as to be fit for direct reproduction—*i.e.*, without re-drawing or amendment. *Unless these conditions are complied with we cannot undertake to reply to queries.*

QUERIES AND REPLIES.

In order to avoid confusion querists are requested to use distinctive words as noms de plume. The letter X. combinations such as X.Y.Z., and words such as "engineer" and "surveyor," should never be used.

HIGHWAY: ADJOINING OWNER'S RIGHT OF ACCESS. "ANXIOUS" writes: In the laying of a sewer in a rural district it was found necessary, if a proper gradient was to be obtained, to keep a length of about 66 yds. of it above ground, where the land dipped. Ordinary sanitary pipes have been used and encased in concrete, and from the top of these to the lowest part of the dip is 1 ft. 8 in. The sewer has been laid on the grass border of an occupation lane repairable by the local authority. The owner A of field adjoining this length of sewer has threatened proceedings if the portion of sewer above ground is not removed, stating that he cannot obtain access to the centre of his field from the highway. There is no gate on this side of the field at present, and no probability of the ground being developed as building land, and the sewer is underground at both ends of his frontage. There are no houses on either side of this portion of lane, which ends at a field-gate about 30 yds. further on. Your opinion is desired on the following: (1) Can owner A demand access to his field at any point from the highway? (2) Could he, or anyone, object to the highway being raised in this dip to the height of concrete, and could the local authority do this without obtaining sanction of Local Government Board?

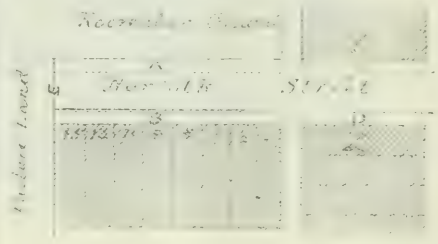
1 The general rule of law is that the owner of land adjoining a highway has a right of access to the highway from any part of his land adjoining the way, and this right of access extends along the whole line of the boundary between the highway and the adjoining land. It was held, however, in *Rowbotham v. Wilson Local Board* (1877), 7 Ch.D. 328, that the power conferred upon a local authority by sec. 16 of the Public Health Act, 1875, to carry any sewer "through, across, or under" any lands within its district, authorised the construction of a sewer on private land partly above ground, subject to the payment of compensation under sec. 308. It appears, therefore, that in the present case the right of access of the owner A has been technically infringed, and that he is entitled to some compensation under sec. 308. (2) Sec. 149 of the Public Health Act, 1875, which confers the power to raise or lower the soil of a street, applies only to urban authorities, and the section is not applied to rural districts by sec. 25 of the Local Government Act, 1894. The level of the highway could not be raised therefore in the absence of urban powers.

RIGHT TO LIGHT.—"Light and Air" writes: I enclose plan showing adjoining properties A and B in a yard or court. The owner of property B wishes to

raise his wall adjoining A's property from point C to D, as shown on plan and section. Would you please give me your opinion whether B will be within his legal rights in doing so?

It is assumed that A has acquired a prescriptive right to light through the window shown on the drawing by the actual enjoyment of the access of the light without interruption for twenty years. This being so, the easement does not necessarily consist in a right to have a continuance of all the light which has hitherto come to the window. The test whether any interference is actionable is not whether the diminution is enough materially to lessen the amount of light previously enjoyed, nor is it entirely a question of how much light is left, without regard to what there was before, but whether the diminution (that is, the difference between the light before and the light after the obstruction) is such as really makes the building to a sensible degree less fit than it was before for the purposes of business or occupation according to the ordinary requirements of mankind (*Colls v. Home and Colonial Stores, Limited*, 1904, A.C., 179). The 45 deg. rule may be a rough test in the absence of any other mode of arriving at a conclusion, but it rests upon no accepted rule of law or evidence.

PRIVATE STREET WORKS APPORTIONMENT. "Ipso Jure" writes: Private street works have been carried out in a street named Norfolk-street under the powers conferred by sec. 150, Public Health Act, 1875. Before the notices to pave, &c., were served on the frontagers by the council, certain works had been carried out as follows: Footway B was flagged 6 ft. wide, kerbed with 12-in. by 8-in. kerbs, and channelled with 12-in. by 6-in. channels. The channels are indicated by thick black line in front of footway B, shown on drawing. Footways C and D were flagged 6 ft. wide, and kerbed with kerbs 12 in. by 8 in. No channels were laid down. Footway A did not exist, nothing having been done by the council as frontagers to the recreation ground. The frontagers did not comply with the terms of the notices served upon them; consequently the council carried out the works by contract, the lowest tender being accepted. The works carried out under the contract were as follows: Footway A was kerbed with 12-in. by 8-in. kerbs, and flagged 6 ft. wide. The whole of the carriageway between the kerbs on each side of the street was paved with the exception of the channelling in front of footway B. This channelling was in good condition, and fit to remain down;



it was therefore allowed to remain. As before stated, all other channels were paved. The cost of the works have been apportioned as follows: The cost of the whole of the flagging and kerbing carried out on footway A has been charged to the council as frontager of the recreation ground. Although it is intended in the future to continue Norfolk-street in a westerly direction, the frontage E has been apportioned on the landowner; the frontage A, or the recreation ground, has been apportioned on the council, the frontagers of [illegible] tioned on the respective owners, all apportioned according to the frontage abutting or adjoining on the street. No notice was taken of the channelling which was laid down before the works carried out under the contract were commenced. In front of the footway B it was simply left there, where it had been fixed at the expense of the frontagers of 1 to 15 (odd numbers) Norfolk-street; it was not taken into account in any way. These frontagers claim that they should have some allowance for the channelling which they laid down. Will you please say: (1) Is the apportionment made a good one legally? (2) Are there any cases decided on all fours with it? If so, will you please quote them?

1 In [illegible] (1880), 5 C.P.D., 248, an urban authority acting under sec. 150 repaired the footway on the south side of a street, and apportioned the whole cost on the premises on the

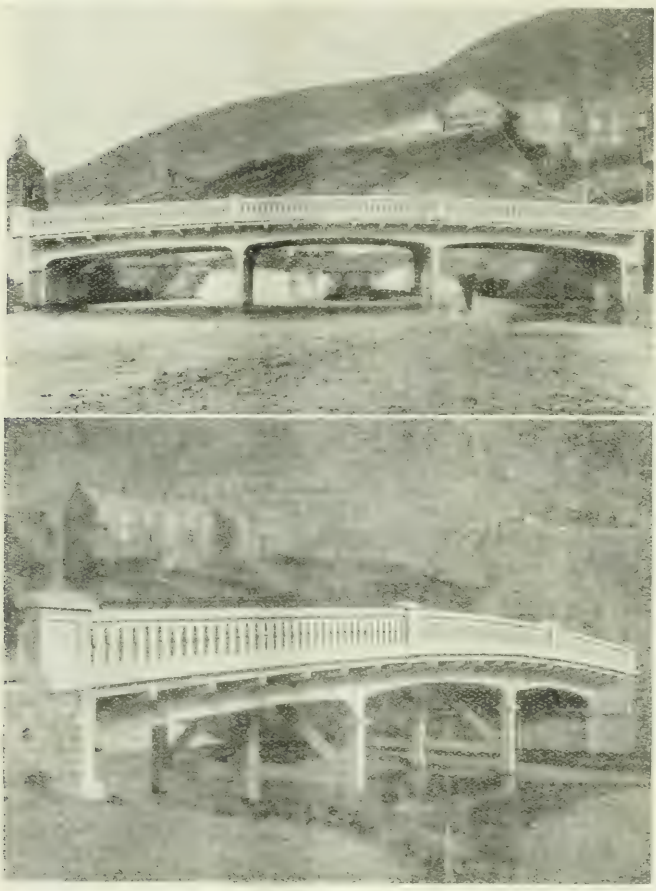
VELINDRE BRIDGE, ABERAVON.

By James Roderick,
Borough Engineer of Aberavon

The Velindre Bridge was erected to connect two parts of the district separated by the river Avon, which are being very rapidly developed. Until the bridge was constructed Velindre was practically isolated, being bounded by the railway on the one side and the river on the other, so that until traffic facilities were provided building operations could not be proceeded with. The new bridge was designed on the Mouchel-Hennebique system of ferro-concrete by the writer, for whom working drawings were prepared by Messrs. L. G. Mouchel & Partners, of Westminster. As the Margam Urban District Council contributed to the cost of the work, the plans were submitted to their surveyor, Mr. Cox, for approval. The structure, which was completed towards the end of last year, crosses the river Avon a short distance north of the town, at the toe of the weir, where the river is 108 ft. wide. It is divided into three spans of 36 ft., and has a width between parapets of 36 ft., providing for a 24-ft. roadway and two 6-ft. footways.



Views of Velindre Bridge.

Each span is supported on piers composed of three 16-in. by 16-in. vertical columns, braced together and founded on splayed ferro-concrete bases on a rock foundation. Each span has three 36-in. by 9-in. main beams, with 15-in. by 7-in. secondary beams spaced 5 ft. apart to support the road decking, which is 4 in. thick. The secondary beams project beyond the main beams, thus forming cantilevers to carry the footpaths. Over the road decking a 9-in. layer of granite metalling was laid, well consolidated with a 10-ton steam roller. The pathways are covered with a 1-in. layer of rock asphalt, with a 10-in. by 6-in. Pennant stone kerb. The parapets are of the open type, and were made in situ in cement concrete, covered with a moulded concrete coping.

On September 22nd last the bridge was officially tested under the direction of the writer, acting on behalf of the Aberavon Corporation, the test load consisting of a 15-ton steam roller. For the measurement of deflection three sensitive deflectometers were adjusted beneath the centre span, one on the north side marked No. 1, one in the centre marked No. 2, and one on the south side marked No. 3.

The first test was made over No. 2 instrument at the centre, when the deflectometers read as follows: No. 1, $\frac{1}{64}$in.; No. 2, $\frac{2}{64}$in.; and No. 3, $\frac{1}{64}$in.

The second test was made over instrument No. 1, when the deflectometers read No. 1, $\frac{1}{64}$in.; No. 2, $\frac{1}{64}$in.; and No. 3, nil.

The third test was made over instrument No. 3, when the deflections registered were as follows: No. 1, nil; No. 2, $\frac{2}{64}$in.; and No. 3, $\frac{1}{64}$in. When the load was removed the construction returned to its original form.

As the contract conditions permitted a deflection of $\frac{1}{4}$in. the tests were considered to be highly satisfactory, and everyone present was well satisfied with the results.

It is interesting to note that this is the second ferro-concrete bridge spanning the river Avon, as the Canister Bridge, described on p. 139, Vol. II., of *Ferro-Concrete* [from which this article is reproduced], was constructed for the Aberavon Corporation in 1910. The latter structure has been exposed to very heavy floods for some few years, and its capacity for withstanding the severe strains involved have surpassed all expectation.

Coroner's Jury Recommend Whitened Kerbs. At [illegible] borough jury who on Saturday inquired into the death of a taxicab driver, killed in a collision with a motor car on the sea front after dark, suggested that all corners and kerbs of roads should be whitened.

Faculty of Surveyors of Scotland. [illegible] been received from the Secretary to the Treasury that that in future the passing of the examinations of the Faculty of Surveyors of Scotland shall be regarded equally with the passing of the examinations of the Surveyors' Institution as affording prima facie evidence of suitability for appointment to permanent positions under the Government.

Hull Corporation Tramways. The Hull City accountant on Wednesday presented the accounts of the tramways undertaking for the financial year ended March 31st last, showing income £163,030 5s. 7½d., working expenses £110,593 18s. 8½d., mobilised employees £3,707 19s. 2d., gross profit £48,728 7s. 9d. The interest, loan charges, income-tax, &c., totalled £34,153 15s. 10d., giving a nett profit of £14,574 11s. 11d. £10,000 of the profits has been put to the relief of the current year's rates, and a balance of £6,076 2s. carried to the reserve fund, which now stands at £146,196 10s. 4d. The sinking fund accumulations total £163,483 19s. 9d. The nett expenditure during the year was £28,058

Assistants' and Students' Section.

CONDUCTED BY SYDNEY G. TURNER, ASSOC.M.INST.C.E.

All communications in regard to this page must be addressed to The Editor, 88 Bride's House, 24 Bride-lane, Fleet-street, E.C. Envelopes must be marked "Assistants' Section" in the top left-hand corner. Correspondents are invited to submit questions for consideration and answers to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.

QUESTIONS.

Two weeks are given for the following questions.

479. Reservoir Dam. Give sketch and description of an earth embankment with clay puddle across a mountain brook 12 ft. wide, rising from each side of brook 1 in 2, the embankment to be 12 ft. high in the river bed. (E. P. M., *Tawgai*.)

480. Sewer Survey. It is required to survey the course of an old brick sewer, 3 ft. diameter, which runs for 1,000 yds. in a very irregular line on a badly-planned design. There are no available records. How can this be done, and what instruments should be used? (W. S. W., *Chesterfield*.)

482. Water Towers. What are the objects of water towers, and how did they originate? In their stead write a short essay dealing with the subject. (C. Reed, *Redruth*.)

483. Bridge Construction.—How are the lengths of the four wing walls of a bridge and the horizontal angle between the bridge and each wall determined? (Theo.)

484. Hydrostatics. A square sluice opening, 3 ft. by 3 ft., is formed in the vertical face of a dam, and the upper edge of the opening is 6 ft. below water. Calculate the hydrostatic pressure upon the square area, and find the exact position of the centre of pressure. (A.M.I.C.E.)

[The Editor is at all times glad to hear from readers who desire to submit questions regarding matters of general interest, points of daily practice, &c., for insertion in the "Assistants' and Students' Section." Questions which are published are taken into consideration, as well as other matter, in awarding the Monthly Premium.]

REPLIES TO QUESTIONS.

474. Roof Truss. When one end of a steel roof truss is supported on roller bearings, which move, as made to accommodate the movement, and to prevent damage to the slates and timbers? How would any movement in the truss affect the roof covering? How much in a 50-ft. span roof does it move? ("T-Square.")

It is not usual to make any arrangements to counteract the movements and prevent damage to the roof covering and timbers when one end of the truss is provided with roller bearings. The movement in the truss is so small that the movement in each individual slate or other covering is nominal, the slates sliding over one another if any movement is necessary. The only case in which allowance is made for expansion and contraction is when the covering is laid in large continuous sheets. The most familiar examples of this are rolls, welts, drips, &c., in lead, copper and zinc coverings. In the case of roof timbers the timbers tend to expand in the same direction as the truss, and therefore minimise the effects; also timber is slightly elastic in its fibres, and the fastenings give sufficiently to prevent damage to the timbers. It should be noted that the theoretical movement due to expansion only partly takes place, as the rigidity of the roof timbers, &c., is sufficient to cause higher stresses in the members of the truss rather than to allow the movement to take place to its full extent. The coefficient of expansion for iron and steel is about ·0000068, and for deal about ·0000028 of its length for each degree of temperature Fahrenheit. The relative expansion between timber and iron per degree of Fahrenheit is thus ·0000045 of its length. Assume that the extreme range of temperature is from 0 deg. Fahr. to 130 deg. Fahr. This is a wide range, and not likely to be realised, as in almost all cases the roof truss is not directly exposed to the sun and frost. In the case of a 50-ft. truss, under the above conditions, the maximum extension of the tie-bar will be $50\times12\times\cdot0000068\times130 = \cdot5304$ in. In the case of the rafters (principal), 45 deg. pitch length about 30 ft., it will be $35\times12\times\cdot0000068\times130 = \cdot37128$ in., while the relative expansion between rafter and purlin (say rafter will be $35\cdot12\cdot\cdot0000045 \times 130 = 24\cdot7$ in. The amount of expansion is seen to be very small, and explains why it is not usual to provide for expansion in trusses of less than 50-ft. span, the necessary movement in such cases being met by the truss rising slightly at the centre. (A.M.I.C.E.)

481. Testing Materials. Mention some tests by which we can estimate or measure the ductility of metals, and some of the reasons which make it important to obtain a test of this property. (A.M.I.C.E.)

The following additional reply to this question has been received since our last issue:—

Ductility is that property of a metal which allows of its being drawn out by tension, a reduction of sectional area accompanying this operation. During ductile extension the material suffers elastic

and plastic strains. The reverse of ductility is brittleness. Mild steel is ductile, while cast iron is brittle. If a ductile metal, such as mild steel, be subjected to a gradually increasing tensile stress, it is found that the resulting strains are proportional to the stresses, or stress = strain × constant, where the constant is the modulus of elasticity; so that if we plot these stresses with their corresponding strains we obtain a straight line OA in diagram, neglecting permanent or plastic strains less than ·00001. When the stress is increased and reaches a certain point, it is noticed that strain increases at a faster rate than the stress, and when this is so the elastic limit has been reached, and plastic strains begin. At a stress a little higher than the elastic limit, the metal undergoes a sudden comparatively large elongation, and we know that the yield-point has been reached. In the diagram B marks the yield-point. After the yield-point is reached the ductile extensions take place, the strains increasing faster than the stresses, as indicated by the curve CD. Strains now produced do not develop as do the strains below the elastic limit. The greater part of the strain occurs quickly, but is followed without increase of load by a small additional extension. During these ductile elongations the area of the cross-section is reduced fairly uniformly along the entire length of the bar, the volume of the test-piece being constant. It should be carefully noticed that when the stresses are calculated for such a diagram as Fig. 1, the load on the test-piece should be divided by the original cross-sectional area of the bar. If

this is done, and the stresses and strains plotted, it is noticed that the stress-strain curve begins to dip after the point D, and the bar fails at a load less than the maximum. However, this is not really the case, for the stress was calculated on the original sectional area of the material, and not on the actual area of section when failure occurred. Between the point D and the breaking-point a waist is formed in the specimen test-piece, and a local ductile extension takes place. Previous to the maximum load the elongations and accompanying contractions in sectional areas appear to be uniform throughout the whole length of the bar. Suppose our bar were 9 in. long, and that the bar were divided into nine equal parts of 1 in. each in length. From our observations we know that percentage elongation of each division would be about equal up to the point D of maximum load. Subsequently, a waist would be formed, say, near the middle division, and at fracture the percentage elongation of the two or three middle divisions would prove much higher than that of the remainder. It is obvious, then, when measuring the percentage elongation which indicates the ductility of a bar, care should be taken to note over what length of bar the observation is taken. Extensions are often measured on a length of 8 in. The geometrical proportions of the test-piece also play an important part in the determination of comparisons between ductilities of specimens. For instance, if on a round bar 1 in. in diameter, the local contraction of section and extension of length is mainly on, say, 2 in., or one-quarter of the whole length, if the bar were 8 in. long, in a bar of ½-in. diameter, the local elongation and contraction would be restricted to 1 in., or one-eighth the length. The local contraction on the thicker bar will consequently add more to the total percentage elongation on the 8-in., since the 2-in. length undergoing the local ductile extensions is a greater proportion of the whole. Prof. Unwin has suggested that a possible method of comparing ductilities of two bars of unequal areas of cross-section is to make the length over which the elongation is measured proportional to the diameter of the specimen, or the square root of the area if the test-piece be not round. However, the increase in the cost of preparing specimens for testing forbids the adoption of this method of making all specimens geometrically similar. Morley, in "Strength of Materials," gives the following method of effecting approximate comparison of ductilities of test-pieces as measured by the ultimate elongation:—

Let e = total extension
l = length gauged for observations

Now e is made up of the general extension proportional to l, say bl (where b is constant), and a local extension a independent of l, which occurs when the waist is formed.

Then

$$e = a + bl$$

and percentage elongation $= 100\frac{e}{l} = 100\left(\frac{a}{l} + b\right)$

a quantity which, for a given sectional area, decreases and approaches $100b$, as l is increased.

The local extension a is practically proportional to the square root of the area of section A, say

$$a = c\sqrt{A}$$

and percentage elongation $= 100\left(\frac{c\sqrt{A}}{l} + b\right)$

a quantity which increases as A increases and decreases as l increases. c and b are constants for a given quality of material. If the percentage extensions of two pieces of the same material, but of different dimensions in length and cross-section, or the extensions of two considerably different lengths on the same piece, are known, then the constants a and b, or c and b can be found from the above formula. Having determined the constants for a material we could approximately the elongation of another piece of other dimensions of the same material by applying the formula. When designing a structure we proportion the sectional areas of the different members so that no member is strained beyond the elastic limit of the material employed, and, in fact, our safe stress is often one-half the stress at the elastic limit. The elastic limit of a test piece can, however, be increased by treatment, but generally at the expense of the ductility of the material. Now lack of ductility [illegible] fail under vibration or shock; failure under dead loads with such a material may take place without warning. Ductile materials, on the other hand, absorb shock to a large extent, and impending failure is often evident; thus excessive deflection in a rolled steel joist would denote that the material may be strained beyond the elastic limit. Again, local ductile yielding in the members of a complex structure will relieve high local stress, thereby preventing a member accidentally stressed beyond the elastic limit from reaching the breaking stress such as might occur if a less plastic material were used. The usual indications of the ductility of a material are the percentages of elongation over a stated length and the contraction of sectional area over the original area at fracture under tension. Ductility is as important as strength, although we usually only endeavour to design structures so that the safe stress, which is generally one-half the stress at the elastic limit, is not exceeded. (M. T. R., *Rhyl.*)

Notes.

Prof. Alexander, of University College, Cork, writes:—

In your "Students' Section," p. 627, of May 14th, I notice two answers to a question on levelling. It seems to me that there is a deal of unnecessary confusion, and one cannot but think that this is entirely due to booking according to the old "rise and fall" method. I append the same readings entered according to the rulings in the books that we use here. [I may say I get these printed locally, and they sell at 6d. each, for a book of thirty double pages, well bound. It is better to have small books rather than perhaps lose a book containing many weeks' valuable work.] I have the same book for the level and for the tacheometer, so that the page here headed "Remarks" is really subdivided into five other columns. The greatest advantage that this "collimation" method possesses is in setting out.

Form of Level Book.

Reading.	Height of Inst.	Elevation.	Distance	Remarks.
3·25	31·55	28·30		O.B.M.
5·00	31·55	26·55		Change
4·75	31·30	26·55		
6·00	31·30	25·30		Change
4·95	30·25	25·30		
6·20	30·25	24·05		

It needs no explanation to see how simple setting sight rails is, where the invert levels of the sewer or channel are written in the first blank column, the rail levels in the fourth, and the necessary readings in the second. The "rise and fall" method is absurdly clumsy and confusing, and it is truly amazing to think that anyone in practical work should still employ it.

Locomotives and Heavy Motor Traffic.—The Departmental Committee recently appointed by the President of the Local Government Board to consider the law and regulations relating to the construction and use of road locomotives and heavy motor cars in Great Britain have begun to take evidence. The committee have examined witnesses representing the Local Government Board, the Secretary for Scotland's department, the County Councils Association, the County Surveyors' Society, and the Institution of Municipal and County Engineers.

Pwllheli Improvement Scheme.—Pwllheli Town Council six months ago started a big parade extension scheme, for which Government grants were made and sanction to loan was received from the Local Government Board. The town clerk reported at the council meeting on Tuesday that the board have now intimated that the loan cannot proceed without further sanction, and that a special inspection was made on the works. A member observed that, if the work was suspended now, damage amounting to thousands of pounds might result from the ravages of the sea in the winter. It was resolved to impress this fact on the Local Government Board.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of SURVEYOR *readers with a view to making the information given under this head as complete and accurate as possible.*

INQUIRIES HELD.

Crompton U.D.C. (May 18th. Mr. W. O. E. Meade-King.)—£400 for extension of [illegible] parish and the Lees Crompton. Mr. E. H. Tullock, C.E., of Stalybridge, explained that [illegible] the present [illegible] at Newbey [illegible] could not be drained to Newbey, and which covered [illegible] The district [illegible] Council had applied to the Local Government Board for sanction to borrow the money, but they could not have sanction for the loan at present, and the Manchester Corporation had [illegible] ing them, and it was desirable that they should have power to start the work as quickly as possible when circumstances permitted the loan being sanctioned. [illegible] and also that the board would recommend the Public Works Loan Commissioners to advance the money. The works were constructed some twenty years ago, before his connection with the council, but he had drawn up particulars, so far as they were ascertainable [illegible]

APPLICATIONS FOR LOANS.

Cheshire C.C. £[illegible] for an isolation hospital at Parkgate and Neston.

Gellygaer U.D.C. £1,500 for [illegible] purposes.

Lancashire Asylum Board.—£27,500 for the new asylum at Whittingham Asylum.

Llandudno U.D.C.—£2,646 for the purposes of electric lighting.

Raunds U.D.C. £1,500 for laying out a [illegible]

LOANS SANCTIONED.

Brierfield U.D.C. £[illegible] for [illegible] and arched culvert at the [illegible] Mills.

Cleethorpes U.D.C. £11,000 for [illegible] sewerage scheme.

East and West Ardsley R.D.C.—£2,000 for works of water supply.

Hartismere R.D.C.—£128 for sinking a well.

Hawarden R.D.C. £380 for the purchase of land for a housing scheme.

Hemel Hempstead R.D.C. £600 for [illegible] machinery.

Paignton U.D.C.—£3,037 for an isolation hospital.

Penistone U.D.C.—£880 for water mains.

Rugby U.D.C. £1,750 for housing, £3,350 for playing fields and £1,400 for cemetery extension.

Scarborough T.C.—£1,450 for a shelter on the fore shore.

FORTHCOMING INQUIRIES.

JUNE.	£
1. **Barrow.** For the purposes of a public park (Mr. W. O. E. Meade-King) ...	1,500
1.—**Branston.** For works of sewage disposal (Mr. A. W. Brightmore)	3,800
2.—**Beverley.** For works of sewage disposal (Mr. H. Shelford Bidwell)	—
2. **Romford.** For works of sewerage (Mr. E. H. Tullock)	540
2. **Skipton.** For works of water supply (Mr. W. O. E. Meade-King)	625
2.—**Wakefield.** For the purposes of the electricity undertaking (Mr. A. W. Brightmore)	
3. **Bromley.** For the purposes of road widening (Mr. E. H. Tullock)	937
3.—**Colywn Bay.** For the purposes of a reservoir and public walks (Mr. W. O. E. Meade-King)	660
3.—**Conway.** For the construction of a bridge and of a water main (Mr. W. O. E. Meade-King)	6,000
3.—**Folkestone.** For works of sewerage (Mr. P. M. Crosthwaite)	1,000
3.—**Oldham.** For works of sewage disposal (Mr. A. W. Brightmore)	485
4. **Cirencester.** For the purposes of street improvement (Mr. W. O. E. Meade-King)	1,200

SOME RECENT PUBLICATIONS.*

[illegible] H. H. Higbie. Price 8s. 6d. nett. New York: John Wiley & Sons, Inc. London: Chapman & Hall, Limited.

This book is designed as a first course in alternating-current electricity for students. The text is carefully graduated, and is confined mainly to a simple though thorough treatment of general principles, together [illegible] priate important departments of electrical engineering practice. The teaching experience of the authors has enabled them to produce a work which will be found well adapted to the needs of those for whom it has been written.

[illegible] Fleming, M.E. Price 8s. 6d. nett. New York: John Wiley & Sons, Inc. London: Chapman & Hall, Limited.

Beginning with estimates of water requirements of different crops on different soils and in different localities, the author proceeds to consider wells and well sinking, pumps and pumping machinery, prime movers, windmill irrigation, the question of cost, and the central station plant. Although the practice of irrigation is, fortunately, not a necessity in this country as it is over a large portion of the American Continent, much of the information contained in this volume will be of interest to British engineers.

SURVEYING MANUAL. By H. C. Ives. Price 9s. 6d. nett. London: Chapman & Hall, Limited.

This little manual (published in New York by Messrs. John Wiley & Sons) is intended for the use of first-year students in surveying, and especially for non-civil engineering students. A very wide range is [illegible] The [illegible] that the description of each instrument or operation is followed by a problem worked out in detail; that field notes are reproduced to a large and clear scale; and that the necessary tables for ordinary work are included.

Arterial Roads in Greater London.—A meeting of the Northern Arterial Conference will be held at the Local Government Board offices to-day (Friday) at 2.30 p.m.

Holborn Council Staff and the War.—At Holborn Borough Council meeting on Wednesday evening, Alderman C. Fitzroy Doll reported that seventy-five out of the council's staff of 180 had enlisted. All the men in the council's service of military age were now either serving or had been rejected.

A Glossary of Road Terms (By H. Percy Boulnois, M.INST.C.E., St. Bride's Press, Limited, 24 Bride-lane, E.C., Price 2s. nett).—The movement towards standardising the principal roads throughout the United Kingdom has rendered it necessary to correlate the nomenclature of road terms in use in different districts, and Mr. Boulnois has compiled a glossary with the hope that it may form a basis for such a correlation. [illegible] *Engineering Supplement*.

Sewage Disposal at Skegness.—The annual report of Mr. R. H. [illegible] engineer and surveyor to the Skegness, Lincs, Urban District Council, states that the total cost of disposal of the sewage of that town, exclusive of loan repayments and interests for the year and the cost of the new works at the farm, was £670, which is equal to 11s. 9d. per house, being 1s. 5d. per house less than reported last year. During the year a double shift for pumping the sewage was [illegible] account of the small storage accommodation at the pumping station. Further, by this means the delivery of the sewage at the farm is spread over a longer period, while generally such a course would at any rate (Mr. Jenkins observes) have a beneficial tendency upon the health of the town as the sewers are thus prevented from being full of decomposing matters for a long period each day. These advantages have been gained at a reduced cost, as the regular wages paid to the second shift man do not amount to as much as was paid previously for overtime and casual labour during storms and wet weather.

* Any of the publications reviewed, or referred to as received, will be forwarded by the St. Bride's Press, Limited, on receipt of published price, plus postage in the case of nett books.

Municipal Work in Progress and Projected.

The Editor invites the co-operation of Surveyor *readers with a view to making information given under this head as complete and accurate as possible.*

The following are among the more important projected works of which particulars appear below: Buildings—Chester, Mid-Lothian, Plymouth, Swansea; housing and town planning—Greenock, Stamford; roads and materials—Berks, Tralee; sewerage and sewage disposal—Aylesbury, Chorleywood, Hemsworth; water, gas and electricity—Ashington.—Particulars of other projected works will be found on our "Local Government Board Inquiries" page.

ADMINISTRATION.

Newport (I.W.) T.C. -A special committee reported that they had decided that the borough surveyor shall employ, engage or discharge the town foreman and other town workmen, and shall have control over the engineer of the waterworks, in addition to the assistant surveyor, but not over the quay superintendent, and that the borough surveyor shall be manager of the sewage works, also manager of the waterworks in lieu of Mr. Way. The committee therefore recommended that in future Mr. Way be termed the waterworks engineer. The council approved the committee's report.

BUILDINGS.

Chester T.C.—The tuberculosis pavilion at Scaland, built at a cost of £1,750, was formally opened recently.

Gellygaer U.D.C.—Plans have been approved for an underground convenience at Ystrad Mynach. The estimated cost is £580.

Mid-Lothian C.C.—The Calder District Committee have agreed to feu to the county council a portion of their ground at Drumshoreland for the purpose of erecting a hospital for advanced cases of turberculosis.

North Riding C.C.—On the recommendation of the Highways and Bridges Committee, the council have agreed that a grant not exceeding £55 be made for repairs to Whorlton Bridge, a joint bridge repairable by Durham County and the North Riding; £67 for additional works in connection with the rebuilding of Flanders Bridge, in the Aysgarth rural district; £75 for repairing a defective portion of Scaling Dam Bridge, in the Whitby rural district; £80 for strengthening the arch of Nunthorpe Bridge, in the Stokesley rural district; and £129 for works and material in connection with the protection of the sea wall at Sandsend.

Plymouth T.C.—The Sanitary Committee recommend the corporation to adopt a scheme for the extension of the hospital accommodation, at an estimated cost of £8,496.

Skegness U.D.C. — The provision of a public abattoir is strongly recommended in the annual report of the medical officer, Dr. Stanley Wallace.

Sunderland T.C.—The lavatories in the municipal buildings are to be reconstructed, at an estimated cost of £115.

Swansea T.C. — The Finance Committee have approved a scheme for an open-air swimming bath for Llewelyn Park, at an estimated cost of £1,200, the work not to be undertaken until the end of the war.

Totnes R.D.C.—Owing to the heavy expenditure—probably £10,000—it has been decided to allow the matter of an isolation hospital to stand over *sine die*. No land or cottage has been taken for the purpose, and in case of an outbreak the council will have to provide temporary isolation.

Wilts C.C. -A scheme has been approved for extensions to the administrative block of the Swindon isolation hospital, at an estimated cost of £2,650.

HOUSING AND TOWN PLANNING.

Aldershot U.D.C. The surveyor, Mr. F. C. Uren, has received instructions to prepare plans and estimates for four workmen's dwellings at North Town, and also plans for converting a disused building into two cottages.

Caerphilly U.D.C.—The council have decided to invite architects and builders to attend a conference to consider the question of town planning and the alteration of the by-laws.

Greenock T.C.—Tenders are being invited for the erection of 150 houses in Roxburgh-street.

Middlesbrough T.C.—A communication has been received from the Local Government Board stating that they were prepared to sanction the erection by the corporation of 100 houses, to be let at rents from 5s. to 7s. per week. The town council, while recognising that houses are required, state that their proposed scheme has been suspended owing to the war.

Rathdown (No. 1) R.D.C.—In declining to hold an inquiry into the council's proposed housing scheme, the Local Government Board point out that even if the requisite funds were available, it would be highly desirable that the council should, in the interests of the ratepayers, defer the execution of the scheme until the present high prices of building materials, occasioned by the war, should again reach a somewhat normal standard.

Stamford T.C.—A tender, at £3,975, for the erection of working-class houses, having fallen through, it has been agreed to re-advertise for the work.

REFUSE COLLECTION AND DISPOSAL.

Bridlington T.C.—A tender amounting to £6,332 has been accepted for the erection of a refuse-destructor adjoining the electricity works.

ROADS AND MATERIALS.

Barnstaple R.D.C.—The council last week referred to a committee a letter from the County Council Bridges and Main Roads Committee calling on the council to appoint a second road surveyor at once.

Bath T.C.—The minutes of the General Purposes Sub-committee raised the question of the roads, and the chairman made a statement in which he said they had received many complaints with reference to street watering, and various letters had appeared in the Press making all sorts of charges against the committee and the officials. It ought to be pointed out to the ratepayers that the country was in a state of war, and it was very difficult indeed to carry on ordinary every-day work. As a matter of fact, it was impossible for the city surveyor, Mr. Fortune, to get enough horses to carry out the work of that committee and other committees. A week ago he had only eight horses left at his disposal, and next day two more were commandeered by the Government, leaving him six only. Try how he would, he could not get horses.

Berks C.C.- The scheme of the county surveyor, Mr. J. F. Hawkins, for resurfacing with Tarmac the sides of the Bath road between Reading and Maidenhead, at a cost of £11,862, has received the approval of the council.

Cleethorpes U.D.C.—The Local Government Board, while approving generally of the council's scheme for widening Grimsby-road, Clee-road, and Humberstone-road, state that a loan for the work cannot be sanctioned at present. The estimated cost is £6,250.

Colwyn Bay U.D.C.—It has been decided to execute repairs to the main road between Station-road and Marine-road, at an estimated cost of £156.

East Sussex C.C.—With reference to letters from various bodies asking the council to defer, during the war, all work in connection with the improvement of the road between Lewes and Newhaven, the council placed themselves in communication with the Road Board, and in consequence of the reply received they have proceeded with the work.

Flaxton R.D.C.—The surveyor, Mr. J. W. Lupton, has received authority to tar-macadamise the footpaths on the main roads instead of asphalting, as was intended. The county council will contribute a moiety of the cost.

Formby U.D.C.—It has been agreed to carry out repairs in Kirklake-road, at an estimated cost of £220.

Kincardine C.C. — A communication has been received from the Road Board with reference to the course it intended to pursue in regard to works of road improvement being carried out during the forthcoming financial year. The board proposed to make grants towards the cost of road improvements which

were immediately required. Unless special circumstances could be shown, such grants would be on a considerably reduced scale. The Board were not prepared to entertain any application at the present time for widenings, diversions, new roads or bridges, or the reconstruction of bridges.

Llanidloes T.C.—The town council received an intimation from the county council that it is their intention to spend £160 in diverting the brook in Longbridge road. It was agreed to contribute £25 towards the cost of the scheme.

Loughrea R.D.C.—The county surveyor, Mr. M. J. Kennedy, reported that he had amalgamated main roads and district roads, thus anticipating the council's declaration for a complete scheme of direct labour for the district. The contract system had utterly failed. The practice of contractors tendering for the fancy roads and leaving the more difficult ones could not continue, and it was most unfair to expect him (county surveyor) to act as road contractor, where everybody else had failed, without giving him the proper facilities. Consideration of the scheme was adjourned, and it was decided the roads which were out of contract be left in the hands of the county surveyor for three months.

Middlesbrough T.C.—The borough engineer, Mr. S. E. Burgess, has been instructed to prepare a scheme for laying out the Saltwells estate, which covers 39 acres.

St. Thomas R.D.C.—The county council, in reply to a resolution passed at the previous meeting of the council protesting against the expenditure on tar spraying, wrote that surface tarring was intended for the maintenance of the roads, and not to cope with the dust nuisance.

Sunderland T.C.—It is proposed to take up the existing stones in Fawcett-street, and relay them upon a bed of pitch, and grout them with pitch, at an estimated cost of £334, to be borne out of current revenue.

Tralee U.D.C.—The surveyor, Mr. A. G. Tough, has prepared a scheme of road improvements which the council have agreed to carry out, provided they can negotiate a loan of £1,730 with the local banks. Meanwhile provision is to be made at the rate of £300.

SEWERAGE AND SEWAGE DISPOSAL.

Aylesbury R.D.C.—A sewerage scheme for the village of Bierton, estimated to cost £900, has received the approval of the council. It has also been decided to prepare a scheme for outfall works in Cublington-lane.

Battle U.D.C.—It was reported that the council in committee had met Mr. W. Lawrence Bradley, the expert appointed for the sewage works, and discussed his report. He had expressed the opinion that the sewage could be properly dealt with on the ground belonging to the council by making use of certain osier-bed land; but it was stated that to remove the bed they would require the freehold of the land. In connection with this a letter from a firm of solicitors had been received stating that their clients were not prepared to sell the piece of land used as a osier bed. The council decided that Mr. Bradley's suggestion to have an informal interview with the Local Government Board should be accepted, and that if the scheme was entertained, an application should be made to the Local Government Board for a loan.

Belper R.D.C.—With respect to the construction of a brick and concrete storm-water culvert at Kilburne, for which tenders have been received, the surveyor, Mr. Robert C. Cordon, has received instructions to consult with the county surveyor, as the county council are contributing a proportion of the cost.

Chorleywood (Herts) U.D.C.—The council have instructed Mr. A. P. I. Cotterell, M.Inst.C.E., of Westminster and Bristol, to prepare a scheme of sewerage and sewage disposal for their district.

Hemsworth R.D.C.—The surveyor, Mr. T. H. Richardson, has prepared a scheme for the construction of a culvert in Carr-lane, South Kirkby, at an estimated cost of £333.

Llanidloes T.C.—It has been agreed to construct fencing around the sewage tanks at the sewage farm, and carry out other necessary repairs.

Oakham U.D.C.—The surveyor, Mr. A. L. Parker, reported recently that the new septic tanks and detritus chamber at the sewage works were now completed, and in working order. The whole of the work had been carried out by direct labour, at a total cost of £211, his estimate being £222. The tanks were designed at such a level to obtain sufficient head of water to work automatic sprinklers on bacteria filters, if required at any future time. They had a storage of eight hours' dry-weather flow, and, before the storm-water overflow came into operation, three times the dry-weather flow passed through the main tanks; consequently a good effluent should be obtained. For designing, preparing the plans, and supervising the work, the council voted the surveyor a sum of twelve guineas, and he was thanked for the efficient way in which he had carried out the work.

Stamford T.C.—A letter has been received from the Local Government Board stating that the board's inspector considered the present contact beds at the sewage farm were inadequate, and that some arrangement was needed for the separate treatment of the excess flow in times of storm. It also appeared that the 15-in. pipe from the contact beds to the irrigation area was very flat and could not be completely emptied, with the result that considerable deposit had taken place in it, a defect which should be rectified. The board further suggested that steps should be taken to prohibit any further firing of the tipped material at the refuse tips near the sewage works, and the tip covered up to the tipping-face with a layer of earth. The town council have decided to reply that they do not feel justified in spending a great sum of money on these works until the war is over.

WATER, GAS, AND ELECTRICITY.

Ashington U.D.C.—The Select Committee of the House of Lords, presided over by the Marquess of Bath, recently began consideration of the Bill promoted by the district council to authorise them to construct new waterworks and borrow £73,000 for the purchase of lands, easements, and works of construction, and £8,000 for extension of main service pipes. Mr. G. J. Talbot, K.C., opened the case for the promoters. The existing water supply, he said, was drawn from colliery workings, and the proposed new supply would be derived from spring wells in Great Tosson, Rothbury. Other works provided for in the Bill were to raise and filter water from wells and store it. All the works were to be executed within seven years. The chief opposition to the Bill came from the Tynemouth Corporation, who asked that Ashington should be compelled to take their water supply from them; whereas Ashington thought that they could get their necessary supply better and more cheaply for themselves. Other opposition came from the Duke of Northumberland, whose mills on the Coquet River, it was asserted, would be injured, and from the Coquet Fishery Board. Mr. Charles Alderson, clerk of the Ashington Council, gave evidence.

Harrington U.D.C.—The council have appointed Mr. Joseph Graham, of Carlisle, engineer and adviser in respect of the proposed new water supply scheme.

Nuneaton T.C.—It was reported at Wednesday's meeting that during 1914 there had been a profit on the electricity works of £878 and on the water undertaking of £420.

Rothes T.C.—The surveyor, Mr. A. Robb, has received instructions to prepare estimates for extensions to the water supply and the construction of a storage tank.

Totnes R.D.C.—It has been decided to proceed with the Bittaford water scheme, the owner of the water agreeing to contribute £20 towards the cost of a larger pipe.

MISCELLANEOUS.

Birmingham T.C.—The purchase of an additional motor ambulance at a cost of £630 is recommended.

Brighton T.C.—The council have agreed to a proposition that the minimum wage paid to able-bodied married employees over twenty-one be increased from 25s. to 27s. 6d. per week during the continuance of the war and for a period of three months after the declaration of peace. The council have also authorised each committee to grant a war bonus of 2s. 6d. a week to all regular employees of the corporation above the age of twenty-one years, who are not entitled to the council minimum wage, such bonus to remain in force for three months after the close of the war.

Mansfield T.C.—It has been decided during the continuance of the war to make the following additional

payments to employees of the corporation in respect of the increased cost of necessities: That married men and single men having relatives actually dependent on them, who are in the permanent employ of the corporation, and are in receipt of 29s. per week or under, be granted on additional sum of 2s. 6d. per week, and those who are in receipt of over 29s. and under 40s. per week be granted an additional sum of 1s. 6d. per week, this grant not to apply to men who have received an advance in their wages since January 1, 1915.

York T.C. The Local Government Board have authorised the corporation to carry out the proposed extension of the tramways from Nessgate to Hullroad. This was one of the works which the corporation submitted was of urgent necessity, and, having regard to the expense already incurred, would involve heavy loss if it were postponed.

PERSONAL.

Mr. Henry C. Hall, surveyor to the Naas Urban District Council, has had his salary increased.

Mr. Edward Daly has been appointed to the position of surveyor by the Bundoran (Ireland) Town Commissioners.

Mr. G. G. Cornish, highways surveyor of the North District, Tavistock Rural District Council, has had his salary increased.

Mr. R. C. Bryan, second surveyor to the Louth Rural District Council, has been appointed surveyor and sanitary inspector to the Wirksworth Urban District Council.

Mr. Valentine D. Doyle, of Athlone, was, at the quarterly meeting of the Longford County Council last week, unanimously appointed to the vacant office of county surveyor.

Mr. T. Skidmore has resigned his position as sanitary inspector of Mansfield, and the council have agreed to a recommendation that Mr. B. Allman be appointed to fill the vacancy, and that the services of an assistant be obtained.

Major T. Hunter, V.D., borough engineer of Leigh, Lancashire, has rejoined his old battalion, the 5th Manchester Territorials, and has been appointed to command the administrative centre of the regiment. The corporation have granted Major Hunter leave of absence.

Mr. T. H. Scott's resignation of the office of burgh surveyor of Inverness was accepted with regret by the town council on Tuesday. It was agreed to advertise for a successor at a salary of £250 per annum. The council decided that only men above military age should apply.

Mr. John A. Hunter, pupil to the surveyor to the Newburn Urban District Council, is with the 4th Battalion of the Northumberland Fusiliers. Mr. Hunter has already seen active service near Ypres, when the Northumberland Brigade and the Canadians so gallantly held the Germans in check.

Mr. L. S. Mackenzie, city engineer of Bristol, and Mr. W. Harpur, city engineer and surveyor of Cardiff, are among those who will speak at the forthcoming meeting of the Royal Sanitary Institute at Bristol, at which Lieutenant-Colonel D. S. Davies will open a discussion on the Co-ordination of Military and Civil Sanitary Services in War Time.

Mr. Richard Gamble, son of the second officer of the London Fire Brigade, has been killed in action. His father, Mr. Sidney G. Gamble, ASSOC.M.INST.C.E., F.S.I., received a training in municipal engineering as second assistant to the borough engineer of Leeds, his native place, in 1875. In the following year he was appointed borough surveyor, in which post he won the confidence and respect of his fellow-townsmen. In 1903 the London County Council placed the whole of the county south of the Thames, and the river service, under his direct charge.

Mr. Thomas Forster, of Newburn-on-Tyne, has been gazetted 2nd Lieutenant in the Royal Engineers. Mr. Forster served his articles with Mr. Thomas Gregory, surveyor to the Newburn Urban District Council, and upon the completion of these he obtained an appointment in the architectural department of the North-Eastern Railway Company as assistant designer of steel and ferro-concrete structures. He then went to Canada and obtained an appointment as assistant engineer for the Canadian Pacific Railway Company, and later held the appointment of assistant engineer to the city of Medicine Hat. Prior to the outbreak of war he had gone back to the Canadian Pacific Railway Company as assistant engineer at Toronto, from which place he offered his services to the War Office.

Mr. S. F. R. Carter, ASSOC.M.INST.C.E., deputy engineer and surveyor to the Heston and Isleworth Urban District Council, was on Friday last unanimously appointed surveyor to the newly-formed urban district of Beddington and Wallington out of over 250 applicants. Mr. Carter, who has had nearly twenty years' experience in municipal work, was articled to Mr. Donald Cameron, late city engineer and surveyor of Exeter, and subsequently held appointments at Enfield, Putney and Wandsworth, previous to going to Heston and Isleworth. He has been associated with Mr. J. G. Carey, ASSOC.M.INST.C.E., chief engineer and surveyor to the Heston and Isleworth Urban District Council, for the past nine years, during which time considerable development of the district has taken place, and large and important public works have been carried out. Mr. Carter handed in his resignation to the Heston and Isleworth Council on Tuesday evening last, when eulogistic references were made by several members of the council as to the excellent services he had rendered during his tenure of office with them. Mr. Carter is an associate-member of the Institution of Civil Engineers, and a member of the Institution of Municipal and County Engineers.

FOR OTHER ADVERTISEMENTS
See End of Paper.

BOROUGH OF STAMFORD.
TENDERS FOR GRANITE.

The Town Council of Stamford invite Tenders for about 1,500 tons of "X" Broken Granite, to be delivered free in trucks at Stamford Station as and when required during the months from June, 1915, to March, 1916, inclusive.

Tenders, with Samples, to be sent to the undersigned on or before June 10th, 1915.

FREDK. R. RYMAN, ASSOC.M.INST.C.E.,
Borough Surveyor and Engineer.

Town Hall, Stamford.
May 26, 1915. (2,589)

METROPOLITAN BOROUGH OF WOOLWICH.
APPOINTMENT OF BOROUGH ENGINEER AND SURVEYOR.

The Council of the Metropolitan Borough of Woolwich invite applications for the appointment of Borough Engineer and Surveyor. Applicants must be Members or Associate-members of the Institution of Civil Engineers.

The salary attached to the office, to include all fees and emoluments, will be £500 per annum, rising, on approved service, by annual increments of £50 to £650.

The candidate to be appointed will be required to devote the whole of his time to the service of the Council, and will not be allowed private practice, nor to hold any other appointment.

Preference will be given to candidates with experience in carrying out works by direct labour.

The appointment will be held during the pleasure of the Council, and will be subject to the by-laws and regulations of the Council in force from time to time.

Particulars of the duties and any further information may be obtained upon application to me.

Applications, stating age, experience and qualifications, and accompanied by copies of not more than three recent testimonials, must be sent to me at the Town Hall, Woolwich, not later than 10 a.m. on Monday, the 14th day of June, 1915, endorsed "Appointment of Borough Engineer."

Any candidate canvassing a member of the Council, either personally or through any other person, will be disqualified; but no objection will be made to a candidate sending a copy of his application and testimonials.

(By order)
ARTHUR B. BRYCESON,
Town Clerk.

Town Hall,
Woolwich.
May 26, 1915. (2,590)

ENGINEERING ASSISTANT, with some practical experience, desires further experience with Engineer or Contractor; will pay premium for good experience.—Box 1,524, office of THE SURVEYOR, 24 Bride-lane, Fleet-street, E.C. (2,591)

TEMPERATURE CHANGES IN MASS CONCRETE.*

By Charles H. Pike, M.Am.Soc.C.E., and A. B. Maydole, M.Am.Soc.C.E.

[illegible] the structural problem [illegible] in long [illegible] to [illegible] reality [illegible] free to [illegible] a change in the [illegible] equal to the [illegible] to produce [illegible] in length. In [illegible] decrease [illegible] a change in [illegible] the [illegible] the material [illegible] is to be expected [illegible] in the [illegible] exposed. In large [illegible] the [illegible] temperature [illegible] the [illegible] are [illegible] and [illegible] due to the [illegible] a [illegible] together [illegible] the [illegible] of [illegible] cause [illegible] the [illegible] to place [illegible] the [illegible] far obtained of experiments being made to determine [illegible] temperature [illegible] the [illegible] Arrowrock Dam, [illegible] with a description of [illegible] used. Although some of these [illegible] have been [illegible] the greater part of the results [illegible] high temperature produced by chemical action while [illegible] be largely descriptive, and should be considered in [illegible] a preliminary paper. Among [illegible] are [illegible] the following:

(1) Large bodies of concrete deposited rapidly [illegible] a certain [illegible] a temperature of [illegible] 90 deg. to 95 deg. within a period of about thirty days, and maintain nearly that temperature for several months.

(2) In the case of [illegible] 2 ft. [illegible] an exposed face, there is a daily variation in temperature of about 2 deg. when the daily variation in the temperature of the air is about 20 deg.

(3) In the case of [illegible] 2 ft. [illegible] an exposed face, there is a daily variation of less than 1 deg. when the daily variation in the temperature of the [illegible] about 20 deg.

(4) In the case of [illegible] 2 ft. [illegible] an exposed face, no daily variation in temperature is apparent when the daily variation in the temperature of the air is about 50 deg.

(5) The seasonal variation in the temperature of [illegible] 2 ft. [illegible] an exposed face is about 50 deg., when the seasonal variation in the mean daily temperature of the air is about 75 deg.

(6) The experiments have not yet been carried far enough to show the seasonal variation at other distances from exposed faces, but it is probable that they become very much less as the distance from the face increases.

PETROL AND PATRIOTISM.

BIG INCREASE IN THE DEMAND FOR MEX SPIRIT.

The well-worn and, in the past, much-neglected phrase "Support British Industries" has received a new life and vigour with the present war. In every circle of industry British goods are now receiving their rightful preference. The motoring community, by no means the least patriotic section of the public, has promptly responded to the national movement, and in the matter of petrol motorists to-day are keen to use only a brand which is entirely free from any enemy influence or control. This is one of the reasons for the great increased popularity of Mex motor spirit, a product of the Mexican Eagle Oil Company, Limited, which company, as most of our readers are aware, was created by the famous house of S. Pearson & Son, Limited.

"Mex," as its name implies, is distilled from the great oil wells of Mexico. It is produced by British capital, brought over in British ships (which, by the way, are the largest oil-tankers in the world), and is packed and distributed by British labour.

The distributing agents for the United Kingdom—the Bowring Petroleum Company, Limited, of London and Liverpool—is the oldest established oil-distributing company in this country, and, needless to add, is and always was an entirely British firm.

* From a paper presented at a meeting of the American Society of Civil Engineers.

Research Scholarships in Technology.—The Manchester Municipal School of Technology, University of Manchester) give notice that ten research scholarships in technology (one of the value of £80, three of the value [illegible] remitted) will be awarded on or about July 5, 1915. The scholarships are tenable during the academic year 1915-16 in the Manchester School of Technology (Faculty of Technology in the University of Manchester). Applications must be received on or before June 21, 1915. Forms of application and all information may be obtained, by letter only, addressed to the Registrar, School of Technology, Manchester.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

NORTHWICH MEETING.

A North-Western District meeting is to be held at the Council Offices, Northwich, to-day (Friday).

PROGRAMME.

11 [illegible] District [illegible] meeting.

11.30 a.m. District meeting.
Reception in the council chamber by the chairman of the council, Mr. Councillor Worsley, J.P.
District business.
Paper by Mr. J. Brooke, engineer and surveyor, on "Municipal Works of Northwich," which will be taken as read.
Discussion.

12.45 p.m.—Visit to baths.

1 p.m. Lunch at Lion and Railway Hotel (tickets 3s. each).

2 p.m.—Leave Lion Hotel.

2.15 p.m.—Arrive Marston salt rock mine.

2.[illegible] p.m.—Leave Marston salt rock mine.

3.20 p.m.—Arrive Anderton Eft.

4 p.m.—Leave Anderton lift.

4.05 p.m.—Arrive swing bridge.

4.30 p.m.—Leave swing bridge.

4.35 p.m.—Arrive sewage pumping station.

4.50 p.m.—Leave sewage pumping station.

5.20 p.m.—Arrive Cote Brook waterworks.

6 p.m.—Leave Cote Brook waterworks.

6.15 p.m.—Arrive Blue Cap Hotel (tickets for tea 2s. each).

7.20 p.m.—Leave Blue Cap Hotel.

Tickets for motor char-à-banc 2s. 6d. each.

It is necessary that the [illegible] of persons attending this meeting should be declared.

A. W. Bradley, M.Inst.C.E.,
Hon. District Secretary.

St. Helens.

SOUTHALL MEETING.

A meeting of the Eastern District will be held at the Town Hall, Southall, on Saturday, June 5th.

PROGRAMME.

2 p.m.—Meet at Town Hall, Southall.
Business.
Read minutes of previous meeting.

2.30 p.m.—Proceed by motor omnibus (fare 1s. 6d. each) to
(*a*) To visit open-air bath;
(*b*) Through Osterly Park to inspect sewage disposal works.

4.30 p.m.—Return to town hall to tea, kindly provided by the engineer and surveyor, Mr. Reginald Brown, M.Inst.C.E.

5.15 p.m.—Discussion of works inspected, and papers by Mr. Reginald Brown (member), "Fourteen Years' Municipal Work in a London Suburb," and Mr. J. H. Edmondson, F.C.S., "Further Experiments and Working of a Sewage Works Laboratory."

Conveyances for the various visits have been arranged, tickets 1s. 6d. each.

J. A. Webb,
Hon. District Secretary.

Great Stanmore.

AYR MEETING.

The annual Scottish District meeting of the institution will be held at Ayr on Friday and Saturday, June 4th and 5th next.

PROGRAMME.

Friday, June 4th.

11 a.m.—Business meeting in County Hall, County Buildings, Ayr.

11.30 a.m.—Discussion on the following papers:

"Suggested Town Planning Details for Scottish Conditions," by John Bryce, M.INST.C.E., Office of Public Works, Glasgow, with criticisms by some members of the Town Planning Committee of the Scottish District.

"Pressure Scraping 15 miles of Water Mains," by James McFadzean, B.SC., ASSOC.M.INST.C.E., assistant burgh engineer, Ayr.

1 p.m.—Reception by the Ayr County Road Board and the provost and magistrates of Ayr in the County Hall.

1.15 p.m.—Luncheon in the Lesser County Hall, County Buildings, kindly provided by the County Council of Ayr.

2.30 p.m.—Discussion on the following papers:—

"Road Work," by R. Drummond, C.E., county road surveyor, Renfrewshire County Council, Upper District.

"Description of Experimental Stretches of Road Laid in the Ayr District, Ayr County, and Meteorological Station in Connection Therewith," by Allan Stevenson, C.E., county road surveyor, Ayr County Council, Ayr District.

"Municipal Housing," by Wm. A. Macartney, ASSOC.M.INST.C.E., burgh engineer, Johnstone.

4.15 p.m.—MUNICIPAL WORKS, &c., TO BE VISITED.

(1) Visit to refuse destructor, electricity station, hospital extension, pavilion and esplanade, tar-macadam roads, &c.

Carriages (kindly provided by the Corporation of Ayr) will leave the County Hall at 4.15 p.m.

(2) Visit to Burns Monument and cottage, by kind invitation of the Corporation of Ayr.

Tramway cars will leave town hall at 4.15 p.m., arriving back at 6.30 p.m.

Tea will be served in the tea gardens at 5 p.m.

NOTE.—The time allotted will only permit of members visiting one of the above.

7.30 p.m.—Annual Dinner in Station Hotel. Tickets, 7s. 6d. each.

Saturday, June 5th.

VISIT TO EXPERIMENTAL STRETCHES OF ROAD AND METEOROLOGICAL STATIONS IN THE AYR DISTRICT AYR COUNTY, HILLHOUSE QUARRY AND TROON.

9.45 a.m.—Motor chars-à-banc will leave Station Hotel at 9.45 a.m. prompt, and proceed to the experimental stretches of road, Hillhouse Quarry, and Troon.

1 p.m.—Luncheon (kindly provided by the Hillhouse Quarry Company) will be served in the South Beach Hotel, Troon, at 1 o'clock, after which the return journey will be made to Ayr, arriving at 2.30 p.m.

Tickets for motor chars-à-banc, 3s. 6d. each.

CIRCULAR TOUR BY MOTOR CHAR-À-BANC TO LOCH DOON, VIA PATNA AND DALMELLINGTON, FOR NITH GLEN.

2.30 p.m.—Motor char-à-banc will leave Station Hotel at 2.30 p.m., arriving back at 6.40 p.m.

5 p.m.—Tea will be served at Dalmellington at 5 p.m. Ticket for motor char-à-banc and tea, 8s each.

6.50 p.m.—Trains leave Ayr Station for Glasgow at 6.50 p.m.

Mr. Young, burgh engineer, Ayr, has kindly offered to arrange for ladies present being well looked after during the meetings on Friday forenoon and afternoon, and also on Saturday forenoon.

DAVID A. DONALD,
Hon. District Secretary.

Grangemouth.

MATLOCK MEETING.

The arrangements for the institution meeting to be held at Matlock on June 12th include visits to the new sewage works, the brine and electric baths, and other undertakings.

J. W. DUDLEY ROBINSON,
Secretary.

INSTITUTION OF MUNICIPAL ENGINEERS.

EASTERN, NORTH-EASTERN AND SOUTH-EASTERN DISTRICTS.

A meeting of these districts will be held at Dunstable to-morrow (Saturday).

PROGRAMME.

1.30 p.m.—Reception at the town hall by his Worship the Mayor of Dunstable, Mr. F. T. Garrett, J.P.

2 p.m.—Leave town hall by conveyance. (Approximate cost of conveyance, 1s. 6d. per head.)

2.15 p.m.—Arrive at sewage disposal works.

3 p.m.—Leave sewage disposal works.

3.10 p.m.—Arrive at gasworks.

3.30 p.m.—Leave gasworks, and proceed on foot to Maiden Bower (old British camp), onward by Green Way (old British road) to Totternhoe Knolls (old British and Roman camps). Inspect cottages erected by the Luton Rural District Council at Totternhoe.

4.30 p.m.—Proceed by conveyance to waterworks, &c.

5.20 p.m.—Tea at Dunstable, by kind invitation of the Mayoress.

Descriptive notes on the various undertakings and inspections will be given by Mr. W. F. Wilkins, borough surveyor, Dunstable, and Mr. H. Pickering, surveyor, Luton Rural District Council.

Trains leave Luton (G.N.R., adjoining M.R. Station) for Dunstable at 12.20, 1.5 and 1.30, and Leighton Buzzard (L. & N.W.R.) for Dunstable at 12.25.

Trains leave Dunstable for Luton at 6.15 and 7.25, and for Leighton Buzzard at 6.5 and 8.13.

G. BELSON CHILVERS,
Hon. District Secretary,

ASSOCIATION OF MANAGERS OF SEWAGE DISPOSAL WORKS.

WIMBLEDON MEETING.

To-morrow (Saturday), a visit will be paid to the Wimbledon sewage works and the S.O.S. works, Durnsford-road, Wimbledon, near Wimbledon Park Station (District Railway).

Members to meet at 3 p.m. at pumping station, Durnsford-road, to view the pumping plant, lime mixing plant, filters and sludge pressing plant, the atomisation of sewage devised by the borough engineer (Mr. C. H. Cooper, M.INST.C.E.), and the recovery of fats resulting from such treatment. Afterwards an inspection will be made of the S.O.S. works, and the products resulting from the destructive distillation of sewage sludge.

MANCHESTER MEETING.

By permission of the Rivers Committee of the Manchester Corporation, a visit to the sewage disposal works at Davyhulme (Urmston) has been arranged for Saturday, June 5th, at 3 p.m.

The works are about 1 mile from Urmston Station.

OBJECTS OF INTEREST.

Experiments in sewage purification by aëration without filtration.

The following is a brief description of the works:—

Dry-weather flow, 28,000,000 gallons; average daily flow, 36,000,000 gallons; maximum flow, 171,000,000 gallons per twenty-four hours.

The existing outfall sewer, 10 ft. diameter, discharges into detritus tanks and screening chambers, and then into a series of twelve settling tanks having a total capacity of 16,000,000 gallons, after which the tank effluent passes on to the primary contact beds, 3 ft. 6 in. deep, ninety-two in number, and having a total area of 46 acres.

The effluent from the primary beds is conveyed by a 13-ft. rectangular channel to the secondary contact beds, containing over 100,000 tons of broken Irish granite for filtering, and having a total area of 38 acres. The final effluent passes into the Manchester Canal below Barton Locks.

Other interesting features are the clinker washer, sludge drying sheds, where humus, washed from the filtering material, is pressed into cake, and sold at 25s. per ton; several Venturi meters in operation; the sludge tanks and sludge steamer, the s.s. "Joseph Thomson;" the sedimentation tanks (capacity 4,500,000 gallons) for storm water; compressed air ejectors for lifting sludge, &c.

The estimated cost of the scheme of extensions is

[illegible] and the plant forms the largest complete [illegible] in the world.

The [illegible] will be in attendance to receive the party and conduct them over the works. Mr. C. H. Ball, M.R.SAN.I. (manager), has kindly arranged to provide the visitors with light refreshments.

ROYAL SANITARY INSTITUTE.

SHREWSBURY MEETING.

Mr. H. Percy Boulnois, M.INST.C.E., will occupy the chair at a meeting of the Royal Sanitary Institute which is to be held at the Guildhall, Shrewsbury, to-day (Friday), when a discussion on "The Value of Mechanical Filters in the Purification of Water" will be opened by Dr. Thomas Orr.

The proceedings will commence at 7.30 p.m.

To-morrow morning inspections will be made of the Shrewsbury housing scheme, Ditherington, mechanical filters at Chester-street, and the public abattoir. The members will be entertained to luncheon at one o'clock by the mayor.

BRISTOL MEETING.

A sessional meeting will be held on Friday, June 11th, in the Civil Court, Guildhall, Bristol, when a discussion, to be opened by Lieutenant-Colonel D. S. Davies, medical officer of health, Bristol, and Mr. L. S. Mackenzie, ASSOC.M.INST.C.E., city engineer, Bristol, will take place on "The Co-ordination of Military and Civil Sanitary Services in War Time."

The chair will be taken at 11 a.m. by Lieutenant-Colonel H. R. Kenwood, M.B., D.P.H.

1.15 p.m.—Luncheon at [illegible] Restaurant, Wine-street, Bristol. (2s. 6d. each.)

2.30 p.m.—Proceed to [illegible] Brandon-street, in Saltford, and visit the Bath new sewage works, and to Twerton to inspect the pumping station. The party will be conducted over the works by Mr. W. H. Rowland, [illegible] (Tickets for motor, 2s. 3d.)

5.15 p.m.—Tea at the Old Red House, New Bond-street, Bath. (Tickets for tea, 1s. 3d. each.)

6.15 p.m.—Motors leave Bath for Bristol.

Tickets for the admission of visitors may be had on application to Lieutenant-Colonel D. S. Davies, M.D., medical officer of health, Prince-street, Bristol, or of Mr. T. J. Macdonald, Carlton Chambers, 29 Baldwin-street, Bristol, who is acting as hon. local secretary of the meeting, and of Mr. E. White Wallis, secretary.

APPOINTMENTS VACANT.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* WEDNESDAYS *to ensure their inclusion in the weekly list of summaries. BOROUGH SURVEYOR'S GENERAL ASSISTANT.—May 29th. Corporation of Burton-upon-Trent. £100 a year. Borough Surveyor.

CHIEF INSPECTOR OF NUISANCES.—May 29th. Corporation of Plymouth. £170–£220. Mr. O. Hall, medical officer of health, Town Hall.

INSPECTOR OF NUISANCES.—May 29th. Dorking Rural District Council. £120 a year. Mr. W. J. Down, clerk.

SURVEYOR.—May 31st.—Llanfrechfa Urban District Council. £146 per annum.—Mr. William Clark, clerk, 44 Coronation-road, Cwmbran, near Newport, Mon.

SURVEYOR'S ASSISTANT.—May 31st.—Corporation of Beverley. £65 per annum.—Mr. J. Gould Smith, borough surveyor, 31 Lairgate, Beverley.

ASSISTANT SANITARY SURVEYOR.—May 31st.—Hemel Hempstead Rural District Council. £90 a year. Mr. L. Smeatham, clerk, The Broadway, Hemel Hempstead.

CLERK OF WORKS.—May 31st.—Finchley Urban District Council. £4 4s. per week. Mr. E. H. Lister, clerk.

ENGINEMAN.—June 1st.—Weybridge and Oatlands Joint Sewerage Committee. 35s. per week, with cottage, light and coal.—Mr. John S. Crawshaw, surveyor, Council Offices, Weybridge.

SURVEYOR AND INSPECTOR.—June 1st. Seaham Harbour Urban District Council. £200 per annum.—Mr. J. W. Richardson, clerk.

ENGINEERING ASSISTANTS.—June 7th.—Finchley Urban District Council. £120 per annum.—The Engineer and Surveyor.

ROAD FOREMAN.—June 7th.—Brighouse Town Council. 45s. per week.—Borough Engineer.

REFUSE DESTRUCTOR SUPERINTENDENT.—June 7th.—Corporation of Coventry. £3 5s. per week.—Mr. J. E. Swindlehurst, city engineer and surveyor.

SURVEYOR AND WATER ENGINEER.—June 8th.—Bridgwater Rural District Council. £250—£325.—Mr. T. M. Read, clerk, Rural District Council Offices, Bridgwater.

WORKING WATERWORKS FOREMAN.—June 8th. Paignton Urban District Council. 30s.—40s. per week. Mr. James A. Hutchinson, waterworks engineer and manager, Town Hall.

INSPECTOR OF NUISANCES.—June 11th.—Spenborough Urban District Council. £150 a year.—Mr. John H. Linfield, clerk, Town Hall, Cleckheaton.

INSPECTOR OF NUISANCES.—June 14th.—Colwyn Bay Urban District Council. £150 per annum.—Mr. J. Amphlett, clerk.

DISTRICT SURVEYORS (2).—June 18th.—London County Council.—The Clerk, County Hall, Spring-gardens, S.W.

TEMPORARY CLERK.—Corporation of Cheltenham.—Borough Engineer, Municipal Offices, Cheltenham.

SANITARY INSPECTOR.—Finsbury Borough Council. £3 per week.—Medical Officer of Health, Town Hall, Rosebery-avenue, London, E.C.

DRAUGHTSMAN.—Public Works Department, Government of the Gold Coast. £250—£300.—Crown Agents for the Colonies, Whitehall-gardens, London, S.W.

ASSISTANT ENGINEERS.—Public Works Department, Government of the Gold Coast. £350—£400.—Crown Agents for the Colonies, Whitehall-gardens, London, S.W.

MUNICIPAL CONTRACTS OPEN.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* WEDNESDAYS *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

Buildings.

HASTINGS.—May 31st.—For the erection of bandstand and covered shelters, for the corporation.—Mr. P. H. Palmer, borough engineer.

DEWSBURY.—May 31st.—For the erection of buildings in connection with the Whitley Sanatorium, for the corporation.—Borough Surveyor, Town Hall.

AYR.—June 2nd.—For the erection of a porter's lodge, mortuary, boundary walls, and entrance gates, and the construction of roads at Heathfield hospital, for the corporation.—Mr. J. Young, burgh surveyor.

GOOLE.—June 2nd.—For the erection of a cooling-room at the slaughter-house, for the urban district council.—Mr. J. H. Castle, engineer and surveyor.

LLANDUDNO.—June 2nd.—For alterations and additions to cottages, and the conversion of two cottages into a golf-house, for the urban district council.—Mr. W. T. Ward, deputy engineer and surveyor.

STAMFORD.—June 4th.—For the erection of twenty-four houses, for the corporation.—Mr. F. R. Ryman, borough engineer, Town Hall.

DUNDEE.—June 4th.—For making reinforced-concrete floors and jointless flooring at generating station, for the corporation.—Mr. H. Richardson, general manager and engineer, Electricity Department, Dundee.

GRIMSBY.—June 5th.—For alterations to "Rutland House," for the rural district council.—Mr. J. F. Wintringham, St. Mary's Chambers, Grimsby.

SOMERSET.—June 5th.—For carrying out sea defence works at Blue Anchor, near Minehead, for the county council.—Mr. Edward Stead, county surveyor, Wells.

FARNBOROUGH.—June 7th.—For the supply and erection of a standard type steam disinfector and

machinery, horse-drawn ambulance, and the erection of corrugated-iron disinfection station, for the urban district council.—Mr. J. E. Hargreaves, engineer and surveyor.

SHORTLANDS. June 7th. For the construction of a subway and other contingent works, for the Metropolitan Water Board.—Chief Engineer, Savoy-street, Strand, W.C.

LAMBETH.—June 8th.—For the execution of work in connection with the painting and cleaning of the infirmary, for the Board of Guardians.—Mr. James L. Goldspink, clerk, Board Room, Brook-street, Kennington, S.E.

GREENOCK.—June 15th.—For the erection of 150 houses, for the corporation.—Office of Public Works, Municipal Buildings.

CASTLEBAR.—June 19th.—For building four cottages, for the rural district council.—The Clerk.

ALDERSHOT. For the re-erection of a temporary hospital. Offers invited from owners of wood or iron buildings.—Mr. F. C. Uren, surveyor.

Iron and Steel.

WIGAN.—May 31st.—For the supply and erection of a Lancashire boiler, for the Gas Committee.—Gas Engineer, Gasworks, Wigan.

PORTSMOUTH.—June 1st.—For the supply of tram rails, fishplates and iron tiebars, for the Tramways Committee.—Mr. V. G. Lironi, engineer, Fratton-grove, Portsmouth.

MANCHESTER.—June 2nd.—For the supply and erection of coal-unloading crane, and conveying plants, for the Electricity Committee.—Mr. F. E. Hughes, secretary, Electricity Department, Town Hall.

NAAS.—June 2nd.—For supplying and erecting gas engines and suction-gas plant, and constructing cast-iron service reservoir, for the rural district council.—Mr. F. Bergin, engineer, 36 Westmoreland-street, Dublin.

MANCHESTER.—June 4th.—For providing and erecting two sets of faces for gas and steam turbines, for the Gas Committee.—Mr. F. C. Price, superintendent, Town Hall.

RHONDDA. June 4th. For the erection of cast-iron water storage tank, for the urban district council.—Mr. J. M. Bowman, Destructor Works, Porth, Rhondda.

ROTHWELL. June 4th. For the construction of stoneware and cast-iron pipe collecting drain, with junctions, manholes and washouts, for the urban district council.—Messrs. Everard, Son & Pick, 6 Millstone-lane, Leicester.

BALLYMENA.—June 5th.—For supplying and laying cast-iron water pipes, for the urban district council.—Messrs. Swiney & Croasdaile, engineers, Avenue Chambers, Belfast.

MADRAS.—July 14th. For the supply of cast-iron pipes, special castings, sluice valves and hydrants, for the corporation.—Mr. J. W. Madeley, special engineer; agents, Messrs. James Mansergh & Sons, 5 Victoria-street, Westminster, London, S.W.

RANGOON.—August 11th.—For the installation of a system of fire alarms, for the municipality.—Messrs. Ogilvy, Gillanders & Co., 67 Cornhill, London, E.C.

HALIFAX. June 12th. For the supply and fixing of a hot-water boiler, for the Education Committee.—Mr. J. Lord, borough engineer.

Roads.

ROWLEY REGIS. May 31st.—For work of tar-spraying, for the urban district council.—The Surveyor.

WANTAGE.—May 31st.—For the supply and hauling of hand-picked stones and rubble, for the rural district council.—Mr. J. H. Robinson, surveyor, East Ilsley.

FINCHLEY.—May 31st.—For making up part of a road, for the urban district council.—Mr. C. J. Jenkin, engineer.

ELY.—May 31st.—For the supply of machine-broken Leicester granite, for the urban district council.—Mr. W. McKelvie, surveyor.

TILBURY.—May 31st.—For the supply of 10,000 gallons of approved refined tar, complying with the Road Board Specification No. 4 for Tar No. 1, also laying 1,000 sq. yds. bituminous-bound granite (graded), 1,000 sq. yds. of tarred slag macadam, and 1,000 sq. yds. of tar-paving, for the urban district council.—Mr. S. A. Hill-Willis, engineer and surveyor.

FINCHLEY.—May 31st.—For making up Holly Park, for the urban district council.—Mr. C. J. Jenkin, engineer.

DUBLIN.—May 31st.—For the supply of a 10-ton steam roller, with scarifier, for the corporation.—Mr. M. J. Buckley, city engineer, 28 Castle-street.

SOYLAND.—May 31st.—For the supply of 750 tons of broken granite, for the urban district council.—Mr. W. Whitehead, surveyor, Council Offices, Ripponden, Yorks.

BEDWELLTY.—June 1st.—For street widening and tar-gravelling, for the urban district council.—Mr. D. H. Price, surveyor, Aber Bargoed.

MANCHESTER.—June 1st.—For the supply of Haslingden flags and kerbs, Haslingden dressed grit crossing setts, flags for manhole covers, flags for coal grids, grit, and limestone and granite chippings, for the corporation.—Secretary of the Paving Committee, Town Hall.

DOVER.—June 1st.—For the supply of 600 tons of granite, for the rural district council.—The Clerk, Workhouse, Buckland, Dover.

PONTYPOOL.—June 2nd.—For the supply and hauling of limestone, for the rural district council.—Mr. R. O. Roberts, district surveyor, Usk.

ORSETT.—June 2nd.—For the supply of 2,000 cub. yds. of broken Kentish ragstone, for the rural district council.—Mr. F. T. Johnson, highway surveyor, 2 Orsett-road, Grays.

NEW SHOREHAM.—June 5th.—For the supply of 400 yds. of surface hand-picked land flints, or, alternatively, 400 yds. of dug pit flints, for the Harbour Trustees.—Chairman, Works Committee, Harbour Offices, Southwick.

WANDSWORTH.—June 7th.—For making up Bracken-avenue, Putney, for the borough council.—Borough Surveyor.

BOLLINGTON.—June 9th.—For the supply of 300 tons of granite macadam, for the urban district council.—Mr. S. Knight, clerk, Council Office, Bollington, near Macclesfield.

WESTMINSTER.—June 10th.—For the execution of paving works and the supply of wood blocks, for the city council.—Town Clerk.

DURHAM.—June 11th.—For the supply of about 12,000 tons of granite cubes and other size granite setts, for the county council.—Mr. Albert E. Brookes, county surveyor, Shire Hall, Durham.

TIPPERARY.—June 12th.—For the supply of four 6-ton end-tipping wagons, for the county council.—County Surveyor, Court House, Nenagh.

EAST SUSSEX.—June 14th.—For hiring steam rollers and scarifiers, for the county council.—Mr. Fred J. Wood, county surveyor, County Hall, Lewes.

TOTTENHAM.—June 15th.—For tar and asphalt paving repairs, for the urban district council.—The Engineer.

LEWES.—June 18th.—For road rolling and the supply of 600 tons of 2 in. broken granite and 600 tons of broken surface-picked flints, for the corporation.—Borough Surveyor.

Sanitary.

FINCHLEY.—May 31st.—For the construction of soil and surface-water sewers in connection with the Woodhouse estate workmen's dwellings scheme, for the urban district council.—Mr. C. J. Jenkin, engineer and surveyor.

EPSOM.—May 31st.—For the removal of house refuse, for the rural district council. — Mr. F. A. Pratley, surveyor, Waterloo-road, Epsom.

CUDWORTH.—June 7th.—For the construction of sewage disposal works, including screen chamber, detritus tanks, liquefying tanks, storm tanks, percolating filters, sludge beds and humus tanks, for the urban district council.—Mr. W. T. Lynam, engineer and surveyor, Council Offices.

SEDGEHILL.—June 8th.—For the removal of house refuse, for the urban district council.—Mr. T. Spencer, clerk.

WANDSWORTH.—June 10th.—For surface drainage at Putney Vale cemetery, for the borough council.—Mr. P. Dodd, borough engineer, 215 Ballam Hightroad, S.W.

HAMBLEDON.—June 12th.—For the collection and removal of refuse, for the rural district council.—Mr. F. Smallpeice, clerk, 138 High-street, Guildford.

The Surveyor

And Municipal and County Engineer.

Vol. XLVII. JUNE 4, 1915. No. 1,220.

Minutes of Proceedings.

New Streets and Buildings.

In connection with the powers referred to in sec. 157 of the Public Health Act, 1875, of making by-laws with respect to new streets and buildings, there have been many cases, some of them quite recent, in which the courts have been asked to decide whether or no, in particular circumstances, a street or a building was "new." To deal first with streets, in *Robinson* v. *Local Board of Barton Eccles*, 1882, 21 Ch.D., 621, the Court of Appeal held that the words "new streets" are not confined to streets which are constructed for the first time out of grass-land or other vacant land, but apply also to an old country road in the neighbourhood of a town which, by the building of houses on each side of it, has recently become, or is gradually becoming, a street in the popular sense of the term, though it was previously a "street within the meaning of the definition contained in the Act. This decision was affirmed by the House of Lords (8 A.C., 798), when Lord Chancellor Selborne said ". . . and in the natural and popular sense of the word 'street,' or the words 'new street,' I should certainly understand a roadway with buildings on each side (it is not necessary to say how far they must, or may be, continuous or discontinuous), and by 'new street,' a place which before had not that character, but which, by the construction of buildings on each side, or possibly on one side, has acquired it." It is a curious thing that most codes of by-laws speak of "laying out" a new street, whereas the word used in sec. 157 is "construction." This distinction is important, for it was held in *Attorney-General* v. *Dorin* (1912), 1 Ch., 369, that the by-laws contemplate something in the nature of a physical as distinguished from a mere metaphorical laying out of a new street, and that consequently, where a defendant had done nothing to the road or its boundaries beyond making the communications between it and his houses and draining his houses into the road, he had not thereby laid out the road as a new street within the meaning of the by-laws.

In answering the question "What is a new building?" considerable assistance may be derived from the statute itself. It is enacted by sec. 159 of the Act of 1875 that, for the purposes of the Act, the re-erecting of any building pulled down to or below the ground floor, or of any frame building of which only the framework is left down to the ground floor, or the conversion into a dwelling-house of any building not originally constructed for human habitation, or the conversion into more than one dwelling-house of a building originally constructed as one dwelling-house only, shall be considered the erection of a new building. This definition is extended by sec. 23 of the Public Health Acts (Amendment) Act, which is only in force, however, in those districts to which it has been applied by order of the Local Government Board. Apart from the express provisions of these sections, it is a question of [illegible] building [illegible] 1884; 48 J.P., 725). Where an old building, not originally constructed for human habitation, is altered by some structural alteration and converted into a dwelling-house, it is as if the person who makes the alteration has built a new dwelling-house, using for the purpose the old materials—that is, the existing building—as well as some new materials, and the whole building so altered is to be treated as a new building—namely, a newly erected dwelling-house. Where, therefore, the owner of a building, which was not originally constructed for human habitation, converted it by structural alterations into a dwelling-house, and the building did not comply with the by-laws, it was held that, under a by-law authorising the council to demolish work erected in contravention of such by-laws, the urban council had power to pull down the *whole* building, and not merely the actual work of conversion (*Hanrahan* v. *Leigh-on-Sea Urban District Council*, 1909, 1 K.B., 263). This case was followed in *James* v. *Tudor* (1912), 11 L.G.R., 452, in which the appellant had for some three years occupied and used as a dwelling-house two vans, one as a bedroom and the other as a living-room. He then built a dwarf wall and placed the vans side by side so that one of them rested on it, and cut out the side of one of the vans so as to build a brick chimney stack in the opening so made. It was held that this was the conversion into a dwelling-house of a building not originally constructed for human habitation. Another case [illegible] (1914), 12 L.G.R., 844. There the respondents pulled down part of an old public-house, and deposited plans for rebuilding this part only. It was held that, upon the true construction of [illegible] the old part and the new—was to be deemed a new building, and therefore the respondents were bound to send to the local authority notice as to, and plans and sections of, the whole building.

Subsidence Problems.

The meeting at Northwich, held by the North-Western District of the Institution of Municipal and County Engineers, once again brought out the variety of the municipal engineer's work, and incidentally the difficult and unusual problems with which he may have to deal. The difficulties met with in Northwich are fortunately somewhat unique, and arise from the subsidences caused by the pumping of brine by the Salt Union. These subsidences are so frequent and do so much damage to property that Parliament in 1896 established a Salt Compensation Board to deal with claims for damage from owners of private property. This board is representative of all the parties affected, and has the power to levy a rate of 3d. per 1,000 gallons of brine pumped. While, however, compensation is given [illegible]

private property, the local governing bodies and public statutory companies get no benefit from the Act. What a serious matter to the local authorities and the public companies this is is seen from the damage done to the roads, sewers, and water and gas mains. One of the roads subsided for a length of 250 ft., and in places to a depth of 7 ft. 9 in. Sewers are found drawn out of their sockets, and, as may well be imagined, are simply crushed to pieces. The waste of water has at times been gauged to be equal to 50 per cent, while the gas mains have a loss of 30 per cent due to the same cause. Buildings have frequently had to be jacked up after settlement, and special precautions, rarely found outside an earthquake area, have to be adopted in their construction. The building by-laws of the council permit frame buildings, and steel or reinforced concrete has been found very suitable for the district. If any person proposes to build a house of unsuitable materials the Salt Union officials can object, and their valuers can take it into consideration when fixing the amount of the damage.

During the discussion of the paper by Mr. Brooke, various points as to the use of special pipes and jointing materials for dealing with such an abnormal state of affairs were raised. No very serious attempt appears to have been made to provide non-rigid joints for sewer or drain pipes, or for adopting more durable or elastic materials than the ordinary earthenware or stoneware pipe with cement joints. In the case of sewers or drains falling 6 ft. or 7 ft. there is probably no practical known method or material which would prevent breakage and collapse. There are, however, many smaller subsidences, where a bituminous or other elastic joint would avoid breakage and leakage. In some colliery districts cast-iron or steel pipes are largely used, or where earthenware pipes are used they are encased in concrete, and at times framed in with stout timber, bound round with iron, or dogged together. For water and gas, steel pipes in such a district will not only possess greater tensile strength and resist shock better than cast iron, but expansion joints will afford much greater safety than the ordinary socketed or flanged joints. The district council are to be congratulated on making such a brave fight against the unkind rebuffs they have received from so many quarters. They had their water supply polluted by the wastes from the chemical industries, and had to go 9 miles further afield to obtain a pipe supply at a cost of £70,000. Then after meeting all the requirements of the Local Government Board with regard to their sewerage and sewage disposal scheme, at a cost of £25,000, they were, within eight years of the board's approval, required to spend another £4,300 to alter the tanks so as to bring them in accordance with the recommendations of the Royal Commission on Sewage Disposal. Public baths rendered unsafe by subsidence are being replaced at a cost of £15,000. A library and museum suffered so much that it had to be demolished. Fortunately the town has always had generous donors among its leading business men, and Sir John Brunner has not only provided another library and museum, but has also built a secondary school at a cost of £15,000. Sir Joseph Verdin, too, has erected and equipped a technical school and gymnasium at a cost of £13,000, and a relative has presented a park and a hospital to the town. The housing of the working classes has not been overlooked, for the council propose to erect thirty-one cottages—twenty-one with three bedrooms and eleven with two bedrooms—as soon as the war and the Local Government Board will permit them to raise a loan for the purpose. A town planning scheme is to be prepared, and this is to include a portion of the adjoining rural area. With the completion of the local sewerage scheme the town can look forward to increased prosperity, for the salt-water bathing has in recent years given it a high standing among our inland health resorts.

* * *

The Value of Mechanical Filters.

The mechanical filter is frequently credited with powers which, taken by itself, it does not possess. Speaking generally it is only an important part of a system which includes preliminary treatment and sometimes after-treatment, without which the good results obtained by the whole complete system would be practically impossible. There is no need for any obscurity, neither is it to the advantage of anyone, including the manufacturer, that there should be any secret about the process. No filter and no system can be safely installed to purify water until the exact quality of that water is known, and the special conditions of each case will decide the details of the work. Such work can only be dealt with properly by the expert. In this respect, as is well known, the manufacturer of mechanical filters brings expert knowledge to bear upon the case, and the result is generally that the water has to be treated chemically. There should be no misunderstanding upon this point. In mechanical filtration coagulation and sometimes sterilisation do quite as much of the work as the filter. As we have before now pointed out in these pages, there is at first sight little difference between the mechanical filter (which is sometimes a concrete tank, say 50 ft. by 20 ft., filled with, say, 30 in. depth of sand, resting on 12 in. of ground), and an ordinary slow sand filter. The real difference is in the fact that with the mechanical filter facilities are provided for regular and perfect mechanical cleaning, the filtration takes place under greater water pressure, with sand of finer grade, and the water receives careful preliminary treatment to fit it for filtration, and if necessary after-treatment is given to kill the germs which even the finer sand cannot absolutely remove.

We deal elsewhere in these pages with an important paper upon "The Value of Mechanical Filters in the Purification of Water," read by Dr. Thomas Orr, the medical officer of health for Shrewsbury, at the meeting of the Royal Sanitary Institute held in that town last Friday. It is, perhaps, to be regretted that the author confined his remarks to works in this country, seeing that in America so much attention is being given to this subject. However, our own works are now of such magnitude, excellence and importance that the author was quite justified in ignoring American practice for the time being if he wished to do so. We question whether the five headings under which the efficiency of filters is dealt with are sufficient. For instance, if the plumbo-solvent action is included, the ferro-solvent action—one of great importance to the engineer, though of less importance to the medical officer—might well be included. One comprehensive heading for efficiency might even be applied—viz., the presence of any objectionable quality, positive or negative; for by means of these modern processes water becomes a manufactured product, and can be produced of any quality required.

Dr. Orr does good service in emphasising the fact that there is a serious source of fallacy in speaking of the bacteria in the filtered water as so much per cent purification. It may sound very satisfactory, for instance, to hear that the elimination of bacteria is 94 per cent. We are told that the water of the service may contain anything from 143 bacteria per c.c. to 9,920 per c.c., according to the season of the year. In this case, 94 per cent purification would result in the presence of 8 bacteria per c.c. in one case, and 590 per c.c. in the other. Thus the percentage reduction gives no indication of the actual purity of the water, which must be judged by the results of an examination showing whether the number of organisms

present a check on the reputed standard. The record of the sterilisation of the Shoeburyness water by means of Chlorox is particularly interesting, showing a further advance against the efficiency of hypochlorite treatment. The evidence brought forward by the author proving the lower capital outlay and lower maintenance cost of the mechanical filter over the slow sand filter is also of special interest. There are other points in this valuable paper and in the discussion which followed it which will be dealt with in a subsequent issue.

Scientific Investigation and Sewage Disposal.

Much has been said and written more than once in the past few years on the need for further investigation on scientific lines into the possibilities of various methods of sewage treatment. Now that the Royal Commission on Sewage Disposal has issued its Final Report, all work of this kind will be left to private initiative or to the spasmodic efforts of local authorities, and with two or three notable exceptions nothing will be done. This is unfortunate, particularly in connection with the latest developments in the aeration of sewage on the lines introduced by Dr. C. J. Fowler and Messrs. Ardern and Lockett, as the results already obtained in a small way suggest great possibilities. The importance of this new method is, however, fully recognised in the United States, where it is being tried in a number of places, the latest being at Baltimore, where the United States Public Health Service are co-operating with the Baltimore Sewerage Commission in carrying out some elaborate experiments to ascertain the best method of putting the system into operation on practical lines. On another page we print an extract from an article by the joint engineers for this work which appeared in the *Engineering Record* of April 24th, where the proposed experiments are described and the co-operation of all other workers in the same field is invited by means of suggestions and criticisms. So far as we can judge, this invitation is extended to their fellow-countrymen alone, but the results will doubtless be published in due course, and while they will have derived benefit from the initial investigations carried out by the British scientists mentioned above, we may hope to reciprocate advantage from their further experiments at Baltimore. At the same time, it appears to us that the method of co-operation between the State and municipal authorities, which has been adopted at Baltimore, is one which might be arranged here with great advantage, although it is probable useless to expect anything to be done, especially under present conditions.

It will be noted that the main object of the Baltimore experiments is to ascertain in what manner the "activated sludge" process can be carried out on the continuous flow system. This is of prime importance, as the experiments which gave such good results at Manchester and Salford were, we believe, all conducted upon the intermittent, or "fill and draw" system, which has the defects which are set out in the article printed elsewhere in this issue. The various points to be determined by these experiments, as described in the same article, cover almost every detail that can be thought of at the moment, but in the figures which will be given as to construction and operation costs it will be advisable for us in this country to confine our attention to the results per unit of population if we wish to use them as the basis for the design of works here, as American sewage is, as a rule, so much more highly diluted than ordinary sewage in English towns. Another point which is not mentioned, but may already be in the minds of those who are arranging the experiments, is the question as to the most suitable depth of the tank in which the sewage is aërated. The rate at which the air passes up through the sewage is regarded as [illegible] to need a considerable depth, as [illegible] the whole of the available oxygen is [illegible] from the air in its final passage to the [illegible] the liquid. The utilisation to the utmost of the air will be an important factor in reducing the operating costs to the minimum. In this connection the use of plates, or other forms of horizontal air baffles, somewhat on the lines of the horizontal layers of slate slabs as used in the Massachusetts experiments at St. Lawrence, will probably be considered.

Scavenging in Urban Districts.

The investigations which have been made under the direction of the Local Government Board into the carriage of infection by flies have led to a realisation by the authorities of the special danger to health of these insects in the abnormal time through which we are passing. The only effective way to deal with the trouble is to attack it at the source—that is to say at the breeding-place. It is now established beyond controversy that the accumulation of refuse in the neighbourhood of dwellings, which is usually a consequence of the use of fixed ashpits, is objectionable not only because of the effluvium nuisances which it tends to create, but also because of the opportunities afforded for the retention of infective material and for the breeding of flies and other pests. This is clearly pointed out in the memorandum which has just been issued by the board as an introduction to a return as to scavenging in urban districts in England and Wales. Quoting from a former report the memorandum explains that the exact share borne by flies in conveying the infection of epidemic diarrhœa cannot yet be stated. It would be a mistake, with our present knowledge, to assume that the problem of the prevention of this disease is limited to the destruction of flies. It is concerned also with the personal cleanliness of the mother who has to prepare the infant's food and with the cleanliness of the house, the back-yard, the court, and the street, from which infective material may obtain access to the infant's food, with or without the intermediation of flies. For practical purposes, however, the number of flies in the summer months may be regarded in some [illegible] index, under present conditions, of the possibilities of contamination of food by pathogenic microbes or by decomposing organic matter, especially in districts in which privies and pail closets persist, and in which accumulations of house refuse or stable refuse are permitted.

Both the memorandum and return are largely concerned with emphasising the unsatisfactory nature of the old method of storing house refuse in fixed ashpits as compared with the movable receptacle of galvanised iron. The latter permits the refuse to be thrown direct into the cart, and is necessarily so limited in size as to require emptying at frequent intervals. Moreover, if it is of a proper type, with a tight-fitting cover, the activities of the fly are restricted, and disinfection is a simple matter. From a summary of the return, which will be found in another column, it will be seen that only 11 per cent of the urban districts of England and Wales are at present furnished with the most sanitary type of receptacle for the storage of house refuse, while 54 per cent still have a considerable number of fixed ashpits. The remaining 35 per cent belong to the intermediate class, which have uncovered, movable receptacles of a miscellaneous character which, while admitting of frequent removal of the refuse, are open to objections which do not apply to the sanitary bin. This in itself affords ample justification for drawing attention to the matter with a view, where possible, to securing the substitution of the sanitary bin for the insanitary ashpit or open, movable receptacle.

Scavenging in Urban Districts.

A LOCAL GOVERNMENT BOARD RETURN.

The Local Government Board have issued to Metropolitan borough, town and urban district councils, and medical officers of health, copies of a return as to scavenging in urban districts in England and Wales which has been compiled from the schedules furnished by the authorities of those districts at the beginning of 1914. The return shows in the appendix what are the arrangements for the storage, collection and disposal of refuse in each urban district, while the preliminary memorandum indicates in what respects defective arrangements may prejudice public health, and how these arrangements may be improved.

The board trusts that councils will take into consideration at an early date the question whether any alteration is required in the present arrangements for storing, collecting and disposing of refuse in their districts, and will endeavour to effect any improvement which may be necessary before the hot weather sets in. They point out that it is especially desirable at the present time, when so many districts are congested with troops and refugees, and when there are peculiar dangers of the spread of infectious disease, that sanitary authorities should do all that is in their power to prevent the retention of accumulations of refuse in the neighbourhood of dwellings, and generally to maintain an efficient service for dealing with house refuse. In particular, the board suggest that authorities should consider whether all or any of the following steps are necessary in regard to their districts:

(1) To require a sanitary bin to be provided in connection with all new houses and buildings.

(2) To encourage owners and occupiers of existing houses to provide covered sanitary bins in place of other refuse receptacles.

(3) To undertake with their own staff the scavenging in the populated parts of their district, and to remove all refuse from these parts in properly covered carts at least once a week, especially during the summer.

(4) Where no destructor is available, to avoid sending refuse out of the district in such a manner as to cause nuisance and danger to health, and where tips are used to secure that they are as remote as possible from dwellings, and that the refuse is covered with earth and the tip fenced in.

It appears that only 11 per cent of the urban districts of England and Wales are at present furnished with the most sanitary type of receptacle for the storage of house refuse, while 54 per cent still have a considerable number of fixed ashpits. The remaining 35 per cent belong to the intermediate class which have uncovered movable receptacles of a miscellaneous character, wooden boxes, tubs, &c., which, while admitting of frequent removal of the refuse, are open to objections which do not apply to the sanitary bin. Among the 611 ashpit towns, however, there are 49 which have less than 10 per cent of fixed receptacles, 81 more with 10 to 20 per cent, and another 138 with between 20 and 50 per cent. 312 districts must be classed as having ashpits as their prevailing type of receptacle; for the remaining 31 the figures cannot be given.

A table in the report shows that a great many districts are replacing ashpits by galvanised-iron bins. In the case of 431 of the 611 towns with ashpits, the conversions that have been made to sanitary bins during recent years suggest that the authorities are making an effort to rid themselves of the more insanitary types of receptacle. In the other 180 districts the number of conversions is not given, or appears to have been very small. In respect of 59 there is practically no information; in 121 no active steps are being taken to substitute bins for ashpits.

The report points out that the difficulties which are sometimes associated with the improvement of existing property do not apply to new houses, and that there is no reason why any urban authority should fail to secure that every new house erected in its district should be provided with a galvanised-iron bin with a proper cover.

A further table shows that in 36·9 per cent of the urban districts no definite stipulation is generally made as to the type of receptacle to be provided in connection with new buildings, but that in some cases bins are usually provided.

Another table in the report shows the arrangements made for the removal of refuse in the urban districts of various classes.

In about 5 per cent of the districts only is the work left either wholly or chiefly in the hands of the occupiers of premises. In about 66 per cent of the districts the removal of refuse is carried out, in the main, by the council's own staff, horses and carts, while in about 10 per cent a contractor either scavenges a part of the district or provides horses or carts for the use of the council's staff. The work is carried out wholly by one or more contractors in about 19 per cent of the urban areas.

The opinion is expressed that scavenging, when performed by a contractor, is frequently not so efficiently carried out as when the council's own staff do the work. It is admitted, however, that all depends on the supervision exercised by the council and its officials.

An important matter affecting the efficiency with which scavenging is performed is, of course, the type of cart employed. In 63 per cent of urban districts refuse is removed in covered carts, or if open carts are used they are covered with waterproof sheets when full, while in 7 per cent both covered and open carts are used. In 30 per cent of the districts, however, open carts only are employed. It is pointed out that this must result, in windy weather, in the scattering of refuse and paper while it is being transferred from the receptacle to the cart, and while it is being carried away for disposal. In addition, dust, which may contain infective matter dangerous to the public health, is liable to be blown about.

In 35 per cent of the urban districts it is the practice during the process of removal to deposit the refuse from some of the fixed receptacles on the surface of yards or streets. In addition, in many of the districts containing fixed receptacles the emptying is carried out at night-time, and, in the uncertain light, thorough cleansing of yard surfaces and pavements is impracticable. These conditions, it is remarked, constitute a serious danger to the public health, especially where wet ashpits are concerned. Filth containing infective matter may be carried from the yards into houses on footgear, and, in addition, the dry refuse must be blown about by the wind and conveyed into dwellings, thus contaminating food and drink.

CESSPOOLS.

The opportunity was taken to obtain the number of cesspools receiving sewage in each urban district, and the results are printed in regard to all districts in which there were thirty or more cesspools, with a statement whether the cesspools are emptied by the council or not. There were, it is shown, 182 such towns among the 1,129 urban districts; but on comparing the number of cesspools in each case with the number of houses in the district according to the census reports, it appears that, as a rule, the cesspools merely serve outlying houses, the chief part of the district being provided with sewers. The exceptions, in which the number of cesspools is 25 per cent or more, include 3 of the 144 smaller towns, 8 of the 482 towns with populations of 5,000 to 20,000, and 22 of the 107 towns with populations under 5,000. As a rule these are the towns in which the water-carriage system prevails much in excess of the sewerage provision, but cesspools are sometimes employed for the purpose of keeping back solids from entering imperfectly constructed sewers, the liquid contents only overflowing to the sewer. There are other urban districts insufficiently provided with sewers in which closets are, in the main, on the conservancy system, and slop water is thrown on to the ground. In some districts cesspools are in use for the collection of slop water only. In a cesspool district, the board observe, the chief respect in which the public health is threatened is the danger of the contents of the cesspool (which is rarely watertight) polluting a neighbouring water supply. This risk is, of course, removed where the water supply is piped to all the houses in the district from a distant source. The remaining disadvantages of the cesspool system are the nuisances and difficulties caused by overflows and by emptying the cesspool and disposing of the contents.

DISPOSAL OF REFUSE.

The satisfactory disposal of refuse (the report proceeds) creates very difficult problems, especially in

[illegible] the larger [illegible] From the point of view [illegible] the [illegible] satisfactory solution [illegible] [illegible] [illegible]

e.g., establishment and loan charges may be included or excluded, and credit may or may not be taken for steam or clinker sold to other departments or the council. Moreover, in health resorts, such as Southport, Blackpool and Leamington, the cost per head of the estimated population is hardly a fair criterion, since that population is sometimes enormously increased in the season, and in such places there is generally a much more frequent collection of refuse, especially from hotels and boarding houses. Subject to these considerations, the board think it may be said that the cost of collection is least in districts with movable receptacles, and the cost of disposal greatest, though not largely or uniformly greatest, in districts where most of the refuse is sent to a destructor.

LONDON.

In the report London is included among the towns in which 95 per cent or more of the refuse receptacles are covered galvanised bins. There are no wet ashpits in London, but some of the twenty-nine Metropolitan boroughs still contain dry ashpits.

In six boroughs—Bermondsey, Bethnal Green, Greenwich, Poplar, Shoreditch and Stoke Newington—though practically all the receptacles are of a movable character, there are some uncovered bins in use. Covered galvanised-iron bins are required in connection with new houses in all boroughs except Bermondsey, Bethnal Green, Kensington and Poplar.

COLLECTION OF REFUSE.

Refuse is collected by the borough council's own men throughout all but nine districts. In Hackney, Holborn, Saint Marylebone, Stoke Newington and Wandsworth it is entirely done by contract; in Chelsea, Lambeth, Paddington and Woolwich partly by contract and partly by the council.

Under the by-laws made by the London County Council under sec. 16 (2) of the Public Health (London) Act, 1891, house refuse must be collected in all districts at least once every week. These by-laws do not apply to the City of London, in which house refuse is collected daily.

Covered carts are used in all the boroughs. In Paddington only is there any emptying of refuse into yards in the course of removal; in this district, it is stated, some of the bins are too heavy to carry.

DISPOSAL OF REFUSE.

Twenty-five Metropolitan boroughs send their refuse out of the district; fourteen out of the total number of twenty-nine possess destructors. Two—Poplar and Woolwich—dispose of a small proportion of their refuse, 15 and 6 per cent respectively, on tips situated within their boundaries.

An Engineer's Will.—Mr. R. E. W. Berrington, M.Inst.C.E., of Wolverhampton, a well-known authority on water supplies, and a former mayor of the borough, who died on January 24th, left £20,796.

Public Health Law.—This concise little work* has been prepared mainly for the use of all concerned in local government work who may find the larger books too elaborate. In twenty chapters it covers the ground sufficiently for its purpose, including such matters as highways, but omitting rating, elections, &c. For students it should be of assistance in preparing for examinations in Public Health Law, while the practitioner will find its arrangements well suited for easy reference.—*The Law Times.*

Society of Architects: South African Branch.—On account of the activities of the society's branch at Johannesburg being restricted during the war and there being less need of funds for general purposes, it has been decided to vote the money usually expended on social functions and visits to works to the relief of distress. The branch has voted a contribution of £25 to the Governor-General's Fund for the relief of distress caused by the war, and has also sent a sum of ten guineas to the funds of the Professional Employment Committee of the Architects' War Committee. The council of the branch also report that the South African School of Mines and Technology has accepted the offer of the South African Branch of the Society of Architects to give prizes of a total value of ten guineas to members of the architectural classes at the school, in the subjects of architectural history and student's class work.

EXPERIMENTAL ROAD CONSTRUCTION IN SCOTLAND.

ROAD BOARD REPORT.

Particulars of the experimental work with various road materials and methods of construction which has been carried out by several county councils in Scotland, under arrangement with the Road Board, have now been issued in the form of a report or memorandum.

The object which the Road Board had in view in arranging for these trials was to secure a test under service conditions somewhat upon the lines of the Sidcup experiments carried out in 1911, of a series of trial lengths of road construction laid down under the general direction and supervision of the board. This series, comprising eight different forms of construction, has been laid down in eight districts, where conditions of traffic, subsoil, &c., are reasonably similar. Records of results obtained are being collected and collated by the board, in more complete manner than is generally obtainable in the case of road surfaces laid down in the ordinary course of road maintenance in different parts of the country.

The various lengths are being carefully watched, and measurements of wear taken at intervals. Complete records are being kept of weather, of conditions of the road surfaces under test, and the expenditure required to maintain them in good order.

The results obtained will be embodied in supplementary reports issued from time to time in the expectation that they will prove of great value to road engineers.

Tests are being made with eight forms of construction, of a nature which might apply to a very large area of the Scottish roads—covering practically all the county roads—and these are fully described in the report recently issued. They are:—

(1) Ordinary water-bound macadam.

(2) Ordinary water-bound macadam, surface-sealed with distilled tar.

(3) Macadam, 3 in. thick, grouted with a mixture of pitch and sand.

(4) Macadam, 3 in. thick, grouted with pitch alone.

(5) Macadam, 3 in. thick, grouted with a mixture of Trinidad asphalt and distilled tar.

(6) Ordinary tar-macadam—*i.e.*, tarred whinstone metal surface-sealed with distilled tar.

(7) Tar-macadam—*i.e.*, whinstone metal with a binding mixture of Trinidad asphalt and distilled tar.

(8) Ordinary tar-macadam, surface-sealed with a prepared Mexican bituminous mixture.

The roads selected are what may be termed "main" or "through" county roads. They average about 18 ft. in width, and have previously been maintained at an annual cost of about £75.

The report (which is published at 2s., post free 2s. 3d., by Messrs. Morrison & Gibb, Tanfield, Edinburgh) includes specifications of the forms of construction adopted, petrological description and physical tests of the stone used, complete tabulated records of the nature of subsoils and foundations, widths of roads, gradients and crossfalls, footpaths, hedges and overhanging trees, actual costs in detail of laying each section, previous maintenance costs, traffic tonnage, &c., together with example charts of measurements being taken, meteorological observations, record of surface conditions of the test lengths, and the forms upon which monthly maintenance costs are returned.

Inasmuch as the work was completed only in November last, no deductions can yet be drawn as the result of the experiments. At the same time the report contains sufficient of interest to commend it to road engineers everywhere. Indeed, the object of the present report has been to record all the conditions obtaining at the commencement and during the construction of this work; and a thorough knowledge of these conditions will be helpful and, in fact, necessary to a full appreciation of the results obtained, as set forth in the supplementary reports when these are issued.

Waterproofed Cement Concrete.—The surveyor for the Farcett schools reports that he used waterproofed cement concrete on flats over corridors in these schools, and speaks highly of the result. He is now about to build a large concrete reservoir, which will also be treated with the cement-waterproofing powder Pudlo.

ACTIVATED SLUDGE EXPERIMENTS AT BALTIMORE.

E. L. [illegible] C. FRANK,
Sanitary Engineer, Baltimore Bureau of Public Health, Sewerage Commission, Baltimore, Md.
and
CALVIN W. HENDRICK,
Chief Engineer, Sewerage Commission.

[illegible] experiments [illegible] what is termed the "activated sludge process" of sewage purification, have been reviewed recently in the American engineering Press. The importance of translating this process from the [illegible] possible [illegible] reducing the cost of operation, by this and other improvements, into the region of workable values, is obvious. The fill-and-draw method, as applied to the activated sludge process, (*a*) consumes an amount of hydraulic head equivalent to the difference between the full and empty water levels; (*b*) produces a low operation efficiency because the filling, oxidation, settling and [illegible] upon each other; (*c*) necessitates periods of non-oxidation which possibly reduce the efficiency of the activated sludge.

PRINCIPLES OF TANK DESIGN.

In an attempt to overcome these difficulties a type of continuous-flow tank, termed the aero tank, was developed in December, 1914, at the Hygienic Laboratory of the United States Public Health Service. The considerations underlying this design are as follows:

(1) The oxidation process is promoted by the degree of fineness of the air or oxygen bubbles introduced into the oxidation chamber.

(2) The oxidation process is promoted by the degree of agitation of the contents of the oxidation chamber, this agitation keeping the particles of activated sludge suspended in the liquid. Agitation may be effected (*a*) by the impact of the inflowing sewage, (*b*) as a secondary function of the oxygen introduction device, or (*c*) as a primary function of special agitators—*e.g.*, some propelling device enclosed, if desired, in a pipe to increase the radius of agitation.

(3) The activated sludge depositing in the settling chamber should be returned continuously into the oxidation chamber, both in order to prevent the depletion of the activated sludge in the oxidation chamber, and to prevent secondary reactions of the activated sludge in the settling chamber.

(4) The passage of oxidation chamber contents into the settling chamber should be effected in such a way as not to hinder the return of the sludge particles into the oxidation chamber.

A tank, therefore, to answer the above requirements may be designed to consist of an oxidation chamber, into which the sewage is continuously introduced, and [illegible] oxygen in a finely divided state and being agitated; a settling chamber, whose inner surfaces are so inclined as to prevent the accumulation of solids; a communicating passage to effect the transfer of oxidation chamber contents into the settling chamber without hindering the return of sludge particles; a communicating passage between the lowest portion of the settling chamber and the oxidation chamber.

Inasmuch as Imhoff tanks, such as those nearing completion for the city of Baltimore, may easily be converted for the above process, the Public Health Service and the Baltimore Sewerage Commission have agreed to make joint experiments for the purpose of testing on a large engineering scale the basic principle of the tank, so as to develop all possible defects and improvements.

SCHEDULE OF EXPERIMENTS.

The proposed schedule of experiments includes the determination of—

(1) The best method of introducing the sewage into the oxidation chamber.

(2) The best method of comminuting air in water.

(3) The best method of agitating the contents of the oxidation chamber.

(4) The optimum period of detention in the oxidation chamber.

(5) The best method of effecting passage from the oxidation chamber into the settling chamber.

(6) The optimum period of detention in the settling chamber.

(7) The characteristics of the oxidised and settled effluent.

(8) The amount of air necessary per unit of sewage.

(9) The best method of sludge withdrawal, and subsequent sludge treatment or utilisation.

(10) The characteristics of activated sludge.

(11) The best manner of initial activated sludge formation.

(12) Possible remedies for defects that may develop in the course of experiment.

(13) An estimate of construction costs per unit of population and per unit of sewage flow.

(14) An estimate of operation costs per year per unit of population and per unit of sewage flow.

This article is written primarily to induce co-operation. Undoubtedly a number of experimenters in the United States have become interested in the apparent possibilities of the activated sludge process, and unnecessary duplications of effort may be avoided if free communication be established between such experimenters. The authors hereby invite co-operative suggestions and exchange of results under the following conditions:—

All communications should be in writing, and addressed to either of the authors.

All communications will be acknowledged.

The periodic exchange of results will be undertaken with those actively engaged in this line of research.

Such suggestions from outside sources as are found in the experiments at the Baltimore plant to prove important modifications or additions to the basic principle are to form material which may be used, if desired, for patents free to the people of the United States, due acknowledgment being given the authors of such suggestions.

THINGS ONE WOULD LIKE TO KNOW.

(Contributed.)

Is there not some truth in the statement "that it is an ill wind that blows nobody any good," when it is considered that the London tramway strike gave to the occupants of houses along the lines of the tramway routes a period of quiet from noise that they have not enjoyed for many years past? Did not also the cessation of tramway traffic bring "grist to the mill" of some of the underground tubes and railways? But what do our enemies think of all these strikes?

* * * *

Is it a fact, as stated in the *Salmon and Trout Magazine* of April, that washings from old bituminous-bound roads are as dangerous to fish as are supposed to be those from newly tarred roads? Are not the experiments detailed in the above magazine well worth the perusal of those who are interested in the subject, it being shown that it is some form of phenol which is dangerous to fish life, and that even in refined tars there are poisons which are dangerous until the tars are set; that even then they are easily broken up, and, being soluble, are a dangerous menace to fish life? Would the remedies suggested—viz., sedimentation in settling pits, percolation over or through soil, or maintenance of a sound waterproof surface—be sufficient? Is not the last-mentioned consummation what all road engineers are aiming at?

* * * *

Is it not a fact that a leading engineering institution still has in prominent positions members who are of enemy alien birth? And would it not be interesting to know what steps are being taken to prevent these men from appearing at meetings where they are not wanted after the crimes their countrymen have committed? Could not the institution in question take an example from the Royal Automobile Club, who have issued the following circular to their members?—

NATURALISED BRITISH SUBJECTS.

I am instructed to inform you that a Meeting of the Committee of the Club was held on the 12th inst. to consider the question of the use of the Club during the War by naturalised British subjects of alien enemy birth, either as Members or as Guests, when the following Resolution was passed unanimously: "That in view of recent events and the consequent state of public opinion, the Committee considers it imperative that no person who, although naturalised, is of German, Austrian, Hungarian or Turkish birth, should use the Club during the continuance of the War either as a Member or as a Guest." The above Resolution was passed, in the interests of the whole membership, in order to avoid friction and unpleasant incidents which might otherwise occur. While the Committee fully realises that there are many naturalised British subjects of alien enemy birth who are loyal to this country, it also feels that this is not a time when discrimination can be exercised. *ALL* Members of the Club are asked in their own interests loyally to support the Committee and abide by the terms of the Resolution until the War is over.

* * * *

Is it a fact that during the recent Zeppelin raid at Wallsend, Blythe, and other towns on the North-East Coast, several fires which were produced by the bombs were immediately quenched by means of hand extinguishers? And if this is so, should it not cause a boom in this description of appliance?

Institution of Municipal and County Engineers.

NORTH-WESTERN DISTRICT MEETING AT NORTHWICH.

In the unavoidable absence of the district chairman, Mr. J. S. Brodie, Mr. C. Brownridge (Birkenhead) presided at the North-Western District meeting of the Institution of Municipal and County Engineers which took place last Saturday at Northwich, Cheshire. The attendance was by no means a large one, but the proceedings were altogether successful. The municipal works of the town were described in a short paper which the engineer and surveyor to the urban district council submitted to the meeting, and an excellent discussion was followed by an interesting round of visits. Those present included Messrs. A. J. Price (Lytham), A. B. Statham (Salford), N. A. Alker (Chorley), W. W. Whyatt (Whitchurch), N. W. Sowden (Whitchurch), F. Wilkinson (Prestatyn), R. C. Cordon (Knutsford), A. M. Ker (Warrington), A. W. Bradley (St. Helens), hon. district secretary, J. Brooke (Northwich), J. A. Settle (Bury), J. A. Brentnall (Northwich), Ward (Northwich), and J. A. Cowley (Northwich).

Assembling at the council offices, the members were received on behalf of the local authority by the clerk, Mr. J. A. Cowley, both the chairman and vice-chairman of the council having been prevented from being present. Mr. Cowley remarked that Northwich had little to commend it in the way of beauty, but they were trying to improve it. He thought they would find in it buildings which would compare with some of those in towns of larger populations, and they were endeavouring to combat the evils of subsidence caused by the brine pumping that went on there, and put up buildings that would be a credit to the town. The statistics in Mr. Brooke's paper provided some evidence of the progress they were making, and he believed there were in the district some points of interest and novelty which they would not find in any other town in the country, and if it was only regarded as a little relaxation from their very arduous duties he was sure their visit would not be regretted by them.

The Chairman, in returning thanks, spoke of the educational value of the institution meetings. The duties of the engineer and surveyor to any local authority were so varied that it was necessary for them to go afield in order to see examples of all classes and types of work. Northwich was a portion of the country they had not previously had the privilege of visiting, and he was sure that they would gather during their stay there some information from which they could profit. The paper which Mr. Brooke was about to submit showed that in that gentleman the Northwich council had a most excellent official.

NORTHWICH MUNICIPAL WORKS.

By J. Brooke,

Surveyor to the Urban District Council.

Northwich has for centuries been famous as one of the principal salt manufacturing centres of the world. The Romans are known to have engaged in the trade in the town.

The manufacture of chemicals, as an allied industry, now employs some 5,000 to 6,000 men, and the river Weaver (one of the finest inland navigations of the country) forms the connecting link with the Mersey, where the products are shipped in ocean-going vessels.

The urban district of Northwich was constituted in the year 1875. It has an area of 1,758 acres, and an estimated population of 19,000. Assessable value, £70,000; district rate, 3s. 4d. in the £ per annum; poor-rate, 3s. 2d. in the £ per annum; death-rate from seven principal zymotic diseases, 1·5; death-rate, 14·4; birth-rate, 26·0.

WATER SUPPLY.

The Northwich Local Board acquired the undertaking of the Northwich Waterworks Company, under the Northwich Local Board Act, 1885. The sources of supply at that time were Wade Brook and wells, in the Castle district, but both sources are now only used for trade purposes and for road and sewer purposes. The Act of 1885 authorised the acquisition of lands at Cote Brook, near Tarporley, a distance of 9 miles from Northwich, and the construction of waterworks, including the main aqueduct and a service reservoir. The amount borrowed for the acquisition of the undertaking and the construction of works was £70,000. The supply at Cote Brook is obtained from springs and boreholes, the water rising under natural pressure and gravitating to Heyeswood reservoir, about 2 miles from the town. The quantity of water delivered into the reservoir is approximately 450,000 gallons daily, and a population of 20,000 is served. Analysis of the Cote Brook water shows it as one of great purity, requiring no filtration.

The Northwich Urban District Council Act of 1914 authorised a further expenditure of £20,000 on waterworks, and the scheme provides for the acquisition of additional lands in the Cote Brook district, and the sinking of two 24-in. boreholes to a depth of 150 ft. and a reduced diameter to 300 ft.

The water from the boreholes will be raised by pumps to a reservoir within a quarter of a mile, at an altitude of 350 ft. above ordnance datum. The aqueduct will follow a different route to the town than the existing main, which passes through a subsiding area. The higher level of the new reservoir will enable the council to supply water to outside districts which cannot now be satisfactorily reached. The additional supply will also permit of a general conversion of closets to the water-carriage system, and the more general provision of baths in the smaller houses.

For the detection of waste, which is very considerable in a subsiding district, there are eighteen meters of the Siemens type, varying in size from 1 in. to 8 in., with recording apparatus, and there are 25 miles of water mains, varying from 2-in. to 15-in. diameter.

SEWERAGE.

Previous to the year 1901 the sewage of a large area of the district discharged direct into the river Weaver, the remaining portion being treated at the Witton outfall works before discharging into Wade Brook. In the year 1901 the higher portion of the district on the west side of the Weaver, having a population of 4,500, was resewered, and new chemical precipitation outfall works were constructed at Winnington. The works were designed to eventually take the whole of the sewage of the district, in addition to a portion of the adjoining rural area. The cost of the sewers and outfall works was about £25,000.

In the year 1909 the council presented a scheme to the Local Government Board for the sewering of an additional area, embracing the low-lying part of the district, with a population of about 10,000. The board declined to sanction the work for the low-lying area on account of the impracticability of maintaining an effectual scheme, owing to the effects of subsidence of the ground caused by the pumping of brine. The major portion of the scheme was approved and the works were brought to a completion last year, the cost of sewers and pumping stations being £9,800.

The Local Government Board required an alteration to the sewage outfall works, which cost £4,300, in order to bring the works to the standard of the recommendations of the Royal Commission on Sewage Disposal. This work was required in face of the fact that the original works were constructed only eight years before, and approved by the board.

The principal features of the scheme are two pumping stations, situate on the easterly side of the river Weaver. Station No. 1 consists of two automatic electrically driven centrifugal pumps, each capable of raising 36,000 gallons of screened sewage per hour to a height of 70 ft., where it discharges into the high-level system on the westerly side of the river, and two three-throw ram pumps, driven by gas engines, each pump capable of dealing with 9,000 gallons of crude (unscreened) sewage per hour.

The No. 2 station consists of two automatic electrically driven centrifugal pumps, each capable of dealing with 10,000 gallons of screened sewage per hour, and one 6-in. electrically driven ram pump. This station raises the sewage about 10 ft., from a low to a high level sewer, which gravitates to the No. 1 pumping station. The rising main at No. 1 pumping station is constructed of 12-in. steel tubes, and passes under the river Weaver and backwater at a depth of 18 ft. below top-water level of river. A 9-in. steel tube syphon conveys sewage from a district on the westerly side of the river Weaver to the No. 1 pumping station, whence it is pumped through the rising main. The approximate length of the 12-in. rising main is 737 yds., and the 9-in. syphon 180 yds. There is a connection from the rising main to the 9-in. syphon, for the purpose of flushing the syphon.

PUBLIC CONVENIENCES.

There are eight public conveniences in the town.

ROADS AND STREETS.

There are 20 miles of roads and streets in the district. The main road carries traffic from Yorkshire and Lancashire to North Wales, and is extensively used by touring cars and commercial vehicles. The surface of the carriageway is paved with 4-in. Newry granite cubes, asphalted for the town area and tarmacadam for the semi-rural area.

The main roads of the district are so affected by subsidence from time to time that it is necessary to restore them. Varying lengths have been raised, extending to a distance of 250 yds., while the greatest depth of filling was 7 ft. 9 in. The work also involves the raising of all sewers and service mains, and the lifting of the premises on either side of the road affected. Care is always taken to allow the carrying on of business during the restoration, and this makes the work more complicated and difficult to deal with.

In the year 1893 the council adopted the Private Street Works Act, 1892, and since that date have made up fifty-eight streets, which have been adopted as public highways. The total cost of these works has exceeded £18,000. The method of apportionment has been mainly on frontage, although degree of benefit has been taken as the basis of apportionment in certain instances.

The question of the provision of a refuse destructor is now before the council, and would have matured into provision but for the intervention of the war.

HOUSING SCHEME.

The Local Government Board have approved a scheme for the erection of thirty-six houses, on 2 acres of land, under the Housing of the Working Classes Act, 1890. Twenty-one houses are provided with three bedrooms, and fifteen with two. The contract price for the erection of twenty-one three-bedroomed houses is £145 per house, and that for fifteen two-bedroomed houses is £135 per house. The cost of the land was £842.

In consequence of the war and the Treasury Order the Local Government Board (up to the present) have refused to allow the work to proceed, although negotiations are in hand with a view to enabling the council to take advantage of the favourable tender.

TOWN PLANNING.

The town planning movement led the council to take action in regard to the preparation of a town plan, embracing practically the urban district and a portion of the adjoining rural area. Differences of opinion arose between the two authorities, and the Local Government Board intervened unofficially and advised that the idea of including the portion of the rural area should proceed. No formal application has been made for sanction to prepare the town plan, but it is likely that such application will be made in the near future.

BUILDING BY-LAWS.

An unusual feature in the building by-laws of the council is that they allow the erection of composite buildings, which are easily lifted or adjusted in case of subsidence. The composition is timber framing, filled in with brickwork. The walls of the rooms are in many cases lined with tongued and grooved matchboarding, nailed to the timber diagonally; this has been found to wonderfully strengthen the building, and thus more effectually resist the effects of subsidence. The modern method of assisting the timber structure is to lay the wooded sills in steel channels, securing the corners with plates.

SALT COMPENSATION BOARD.

In the year 1896 the Salt Compensation Board was established under the Brine Pumping (Compensation for Subsidence) Provisional Order Confirmation Act, 1896. The Act constitutes a board, composed of members of the county council, the urban and rural councils, and representatives elected by the brine pumpers. Owners of private property submit claims to the board for damage in respect of the pumping of brine, and after adjudication a rate is levied on the brine pumpers, sufficient to meet the total claims in one year; the rate, however, is limited by the Act to 3d. per 1,000 gallons of brine pumped. The brine is registered by meter, but the maximum rate has never been levied. Local authorities and public statutory companies are excluded from the benefits of the Act.

In 1887, Mr. Robert Verdin, M.P., a native of the town, presented to the town, to commemorate the Queen's Jubilee, a combined gift of a public park, public baths, and a hospital, which immediately proved an immense boon to the district. Unfortunately, the baths, which were beautifully designed, on the half-timber principle, were affected by subsidence, and, after spending large sums on their repair and adjustment, the council decided to abandon them, as they became unsafe. The swimming bath was formed of iron plates, riveted together, and as the building was raised the pond was separately adjusted.

There was a feature of the baths interesting to sufferers from rheumatism, sciatica, and kindred complaints. A supply of brine was laid on, and the brine baths, which were served in the ordinary slipper baths, became a strong rival of Droitwich. The water in the swimming bath also contained a percentage of brine, bringing the density to a little over that of sea water.

New baths have been erected, and are now nearing completion, from the design of Mr. J. Ernest Franck, A.R.I.B.A., of London. I hope members will take the opportunity of inspecting the building, which, when completed, will probably cost £15,000, including the internal fittings. The swimming pond is 75 ft. by 30 ft., and is of reinforced concrete. The dressing-boxes are collapsible. There are eighteen slipper baths, fitted with fresh water and brine, and two dressing-rooms are provided for some of the baths. The council have found that much time is saved by this arrangement, especially in the case of brine bathers. Bathers come from all parts of the country, and the Northwich brine is strongly recommended by the medical profession for its curative properties, as it is the strongest brine in the world.

Northwich has been particularly fortunate in having public-spirited benefactors, for, in 1886, Sir John Brunner, Bart., presented a fully equipped library and museum to the town. Twelve years afterwards, subsidence had so affected the building that it had to be demolished, and in its place Sir John Brunner generously provided another building, erected on the half-timber principle, which is quite an architectural feature of the town.

The technical schools and gymnasium were the gift of Sir Joseph Verdin, and were erected and equipped at a cost of £13,000. This building is not erected on the composite principle, as the site is supposed to be outside the subsiding area. Quite near the technical schools, a modern secondary school has been erected by Sir John Brunner, providing accommodation for 300 scholars, at a cost of £15,000.

The council are the owners of the manorial rights, which are very ancient, and a market is held on two days of the week. The market hall was erected in 1876, on the composite principle, and contained a gallery running along the four sides of the building, on which are erected stalls for the sale of small articles. The annual profit of the markets carried to the District Fund is £340.

DISCUSSION OF MR. BROOKE'S PAPER.

The CHAIRMAN (Mr. C. Brownridge), in moving a vote of thanks to Mr. Brooke, said he wished to congratulate the latter on his most excellent summary of the works which had been carried out in Northwich. If he had to make any adverse criticism on the paper it would be rather that he did not go far enough with it. At the same time, he thought they might justly congratulate him on its concise and readable character, and to that extent the advantages outweighed the disadvantages. But he would like to ask Mr. Brooke to amplify his paper on one or two little points. It was very often forgotten when a paper was being written that it was on the little points, as a rule, where they stuck. In a town like that, which was catering so excellently as a watering-place, it was, of course, of extreme importance that

F

there should be a water supply without reproach, and he should like Mr. Brooke to tell them the nature of the geological formation into which the boreholes were sunk. It would also be of great value to know the type of pump he was going to install. Northwich was, of course, justly famous for its brine baths, and it was likely to be more so in the near future. Men would be coming back from the front seriously racked by rheumatism, and places like Northwich could do much to bring them back to the full enjoyment of life. In dealing with sewage, many of them were troubled in designing sewerage systems to know what other people did in regard to making provision for rainfall, and it would be extremely valuable if they could be told what had been done there—what rainfall was provided for, and what proportion of that it was expected to get to the sewers. Of course, Northwich was somewhat exceptionally circumstanced —a novel district—and much of the rainfall might not go into the sewers. In dealing with the Local Government Board in connection with the alterations of the sewage outfall works, he noticed Mr. Brooke had had a little trouble, and perhaps he would tell them the nature of the difficulty that had arisen. In regard to roads, they had not been told the nature of the stone that Mr. Brooke used for his tar-macadam. It was a great advantage to know what various districts were doing in regard to that question. He might say at once that he used both limestone and granite, and, if anything, he had a preference for certain classes of granite; but in certain streets—and that was a great point—he preferred to make use of limestone. They heard of surveyors saying they could not make a good tar-macadam of granite, but he did not agree with that if the stuff was properly made. He was afraid they were apt to make tar-macadam on a principle which, if applied to the mixing of concrete, would be courting disaster. He was very pleased to see that Northwich had tackled the question of town planning. Differences of opinion, he observed, had arisen between the urban and rural authorities. That was a difficulty that had arisen all over the country, and it was a question whether town planning would be altogether a success until there was some sort of compulsion instituted. So he congratulated Mr. Brooke on securing the intervention of the Local Government Board and getting the rural area included. He would like to ask whether Mr. Brooke had had any experience of the use of reinforced concrete in the district, for it would be interesting to know whether that was a material that could be employed with advantage in places subject to subsidences. They knew it had been used with great success in earthquake countries, so that it was possible that it would be of value in Northwich.

Mr. A. J. Price (Lytham) seconded the vote of thanks. The paper was a short one, but it was none the worse for that. They sometimes got papers altogether too long—papers which did not contain much matter—and when they had a contribution concise and to the point they ought to congratulate the author. He noticed the old water supply seemed to be only used now for trade and road and sewer purposes. Was that due to the wells and brooks becoming polluted, or salt getting into it? In an industrial town like Northwich a large amount of water must be used, and to have a double supply was a very useful thing indeed. He would like to know the water rate, and how much per 1,000 gallons was paid for water used for trade purposes. One thing which had struck him was the large range of work that Mr. Brooke had entrusted to him. The difficulties with which he was faced in connection with the sewerage not only called for their sympathy, but admiration for the way in which he had tackled the work; continual troubles of that kind demanded great watchfulness and skill. Was any special form of joint used—iron pipes, or any special form of bitumastic joint, or simply ordinary stone pipes with cement joints? It seemed to him that a bitumen joint would be the best, as it would give a little. He had to sympathise with the Northwich council after carrying out works of sewage disposal which met the wishes and requirements of the Local Government Board being compelled eight years later to spend another £4,300 in order to bring the undertaking up to present-day standards. He supposed there would never be any finality about sewage disposal, but it was a distinct hardship on people who had gone to a great expense on a scheme to be almost immediately afterwards called upon to supplement the works or alter the character of the works altogether. He saw that electrically-driven centrifugal pumps were used, and he would like to know that was due to the cheapness of electricity as compared with steam or suction gas, for, unless pumping was of an intermittent character, electric power was an expensive matter. He would also like to know whether Mr. Brooke had had any trouble with the syphon under the river; but his own experience of syphons was that they were very liable to get blocked up, unless care was taken to keep them open. The jacking up of premises which had to be carried out following subsidences seemed to point to the desirability of all buildings in the town being so erected as to facilitate those operations, and to be a sufficient reason for by-laws different in character from those of other towns.

Mr. A. M. Ker (Warrington) said the matter of dealing with the rainfall in designing the sewers brought him to a point with regard to the pumps. He found that provision was made for over 2,000,000 gallons in the twenty-four hours, which was a very large quantity for a population of 19,000 people—well over 100 gallons per head. Had Mr. Brooke had any difficulty with the working of the automatic arrangement on the electrical pumps? The district he (the speaker) came from was in parts a low-lying one, and the sewage was dealt with by Shone's pneumatic ejectors. It would be necessary to extend the system of pumping in places in order to take in further districts, and he would be interested to know in more detail how these electrical pumps worked.

Mr. J. A. Settle (Bury), after making an inquiry as to the hardness of the water, asked if Mr. Brooke had experienced any difficulty from his sewers being damaged by chemical wastes. At the present time he was reconstructing a sewer damaged in that way, and he had found it necessary to protect the pipes by two layers of bitumen. In regard to the housing scheme, the greatest difficulty he had was to educate his council to the fact that municipal corporations could not build houses as cheaply as private builders. The private builder looked for a return of, say, 5 per cent, and at the end of twenty years expected to sell those houses at the same price they cost him, or somewhere about it. In the case of a corporation they got borrowing powers. For the first twenty years at least they could not show that houses were going to pay for themselves—unless in other places they were more fortunate than at Bury. At the end of twenty years they had paid off one-fourth the cost of the land, the cost of the street works, and part of that of the buildings. Unless they could show this as an annual balance-sheet, the corporation said they were losing. If Mr. Brooke would add to his paper what he intended to spend on street works in connection with these houses, and what he would get in rent, it would be very helpful. Were the houses to be built in rows or semi-detached? If semi-detached, which was most desirable, especially in a place like Northwich, where land could not be so expensive, they could dispense with back roads and save street works.

Mr. A. B. Statham (Salford) stated that they were troubled a good deal in his district with subsidences due to colliery workings, and he was interested to know of any methods of dealing with such troubles —particularly as regarded water mains. In some cases they had found it necessary to encase their sewers —21-in. pipes—with planks bound round with steel bands. Latterly their sewers had been laid entirely on reinforced concrete, but that had not been done long enough for him to say how it answered. They found that these methods of dealing with subsidences were expensive, and therefore he was anxious to learn of anything cheap and effective that could be adopted. The Northwich by-laws permitted the erection of composite buildings of timber framing filled in with brickwork. He assumed the timber went right through the walls, but he should like to know whether it was a compulsory or purely optional form of construction. It seemed to him it was desirable almost to make it compulsory in the interests of public safety. Mr. Price had said that electric pumping was not economical, but with a fluctuating flow he should have thought it was.

Mr. Settle, in some further remarks, said he regarded it as a mistake for the council to have approved a scheme which had resulted in the front of the new baths projecting beyond the adjoining buildings. To bring the establishment close upon the street was an error they would realise when the building was in use.

The vote of thanks was passed.

Mr. Brooke, in replying, said he first wished to

all the works that he had described to the members. Proceeding to deal with the various points raised in the course of the discussion, he stated, as regarded the question of the strata, that they had sunk six or eight boreholes in his time, and these were all through the Keuper marl. These augmented the [illegible] per cent. [illegible] to a certain extent, the flow of the springs, but eventually they got an increase. In regard to the sewage works, these were intended originally to be precipitation works, but they were never used as such. As to tar-macadam, personally he had never favoured granite for tar-macadam. The smaller granite seemed to be fairly satisfactory, but there was a considerable amount of dust in it. With regard to the reinforcement of buildings, they had two reinforced-concrete buildings, and they were both on the Hennebique system. One of them had been erected four years, and, so far as one could see, it had stood the stress; at the same time they had to remember that it was very expensive. The source of the old water supply was polluted by chemicals to such an extent as to render it useless for anything; but finally a pipe line was put in beyond the area of pollution to their works and improved matters. They used the water for locomotive purposes. It was roughly filtered, and answered fairly well; but beyond that they could do nothing with it. The water-rate was 6d. in the £ on the assessable value, and the price charged for water was 9d. per 1,000 gallons for large quantities, the ordinary charge being 1s. The price for electricity was 2½d. per unit. Their installation was not long-lived. They were only getting it into form, and only getting their statistics up in regard to it. The advantage they had in running the centrifugal pumps was that they could run them through the night without any attention. The electricity works were not the property of the council, but of a private firm. As to the jacking-up of buildings, that was the only thing they could do; so far as his experience went for twenty-three years, they could not do anything else. With regard to the drains, some time ago an inspector of the Local Government Board went to Northwich to investigate the question of the by-laws for the adjoining rural district, and, along with the county medical officer of health, wanted to insert in the by-laws a provision that the whole of the drains should be constructed of iron. They [illegible] able to convince them of the impracticability of doing that. Previously the joints were of clay, but now they were made of cement—and if they broke they broke. In regard to the brine baths, they put in just enough brine to give the water a sort of floating action. As to the centrifugal pump at the outfall, they found that very reliable now. The automatic arrangement was put in by Adamsez. The total hardness of the water was 14. They had had no experience of the action of chemical wastes on their sewers. They were just outside the area of the chemical works. The difficulties with the water mains owing to subsidences caused him more worry than anything else. A recent test showed that a waste of no less than 50 per cent was going on. They knew the areas in which the faults existed, but it was impossible for them to locate the places exactly. A suggestion had been made that it should be compulsory in such a district that only buildings of a special type should be erected; but that was practically the case at present, for when it appeared likely that an unsuitable building was going to be erected, the compensation commissioners immediately stepped in.

VISITS.

After the meeting the members visited the new baths the council are now erecting to take the place of the old baths, which have been abandoned owing to damage by subsidence. The new swimming bath is constructed on a reinforced concrete raft, and the walls are of the same material, and these and the slipper baths, and the heating and brine-mixing apparatus were inspected with great interest.

After lunch at the Royal Hotel, the party drove by motor char-à-banc to the Marston Rock Salt Mine. They were shown over the mine by Messrs. Bradbury & Bennett, the Salt Union's courteous officials, who had illuminated the mine in honour of the visit. The mine is 336 ft. deep, is practically circular, and covers an area of 30 acres. No timber props are used, as the roof of the mine is about 25 ft. high, and has a thickness averaging 50 ft. of rock salt, which is supported on piers left in the rock salt, each 33 ft. square, and spaced some 75 ft. apart. The salt is mined with cutting machines worked with compressed air at 20 lb. pressure, and by drilling and blasting, and a number of shots were fired during the visit of the party. The rock salt is chiefly used by the chemical works in the district, but large quantities are now being sent to France for the use of the cavalry and other horses.

A visit was next made to the sewage pumping station, where the electrically driven centrifugal pumps and the automatic gear for starting and stopping the pumps were inspected.

The party were then driven some 9 miles to the Cote Brook waterworks, near Tarporley, passing on the way the Anderton lift and swing bridge, and going over a roadway which, following subsidence, was being raised several feet. After inspecting the springs, boreholes and gauging house at Cote Brook, the proceedings were pleasantly terminated by the serving of tea at the Blue Cap Hotel.

ARTERIAL ROADS IN GREATER LONDON.

MEETING OF THE NORTHERN SECTION.

At the Local Government Board offices on Friday last a meeting was held of the Northern Sectional Conference in connection with the scheme for arterial roads in Greater London. The chair was taken by Mr. W. Regester (chairman of the Northern Sectional Conference), and those present included Colonel Hellard (representing the Board of Trade), Mr. George L. Pepler (representing the Local Government Board), Mr. W. E. Riley (superintending architect to the London County Council), Mr. W. Nisbet Blair (borough engineer and surveyor of St. Pancras), Mr. P. G. Killick (borough surveyor of Finsbury), Mr. E. J. Lovegrove (borough engineer of Hornsey), Mr. E. F. Spurrell (borough surveyor of Holborn), Mr. Cuthbert Brown (surveyor to the Edmonton Urban District Council), Mr. J. E. Sharpe (surveyor to the Cheshunt Urban District Council), Mr. C. H. Croxford (surveyor to the Wood Green Urban District Council), and Mr. H. York (surveyor to the East Barnet Valley Urban District Council).

The conference approved with unanimity the recommendations of the sub-committee that the following roads should be constructed: The North circular road between Edgware-road and Edmonton, the new Cambridge road between Hertford-road and Tottenham High-road, a proposed road between Essex-road and Lea Bridge-road, another between City-road and Hackney-road, and a by-pass at Chipping Barnet.

Considerable discussion arose on the subject of the building line and the authorities by whom it should be prescribed. The sub-committee submitted a proposition that "powers should be given to the London County Council and the council of any borough or urban or rural district to prescribe building lines to existing roads, or new roads recommended by the conference." The chairman argued that there should be an appeal to the Local Government Board, as he held the opinion strongly that the question of arterial roads emanated primarily from that authority. He felt quite sure that all the local bodies would help the Local Government Board to the best of their power. Other speakers took exception to the inclusion of the London County Council. Eventually an agreement was reached by the adoption of the proposition in the following amended form: "That powers should be given to county councils, after consultation with the local authorities concerned, to prescribe the building line on existing roads, to the maintenance of which they contribute, or to any other roads approved by the Arterial Roads Conference."

The conference also passed a resolution affirming the desirability of the Local Government Board preparing or obtaining preliminary estimates as soon as possible, so that the probable cost of the respective improvements may be available, and that in the event of unemployment following the war, or otherwise, information as to a useful outlet for labour will be ready to hand.

Colonel Hellard was requested to prepare 25-in. plans of the routes approved, to be kept at the Local Government Board as a record, and Mr. Pegler was asked to draft a report by the main conference setting out the chief routes approved, the principles advocated, and the further procedure that is proposed under present conditions.

The Royal Sanitary Institute.

THE VALUE OF MECHANICAL FILTERS IN THE PURIFICATION OF WATER.

By THOMAS ORR, M.D., D.Sc., Medical Officer of Health, Shrewsbury.

The efficiency of the mechanical filter must be gauged to a very large extent by the character of the water to be treated for example, if it has an excess of suspended matter, if it contains an unusual amount of peaty matter, causing a dark colour, or giving it a plumbo-solvent action; if it contains an excessive amount of iron in solution; if there is evidence of excess of bacteria, or if there are special difficulties in securing a suitable supply, as in the tropics or on military expeditions. The quality of the water is, of course, determined by its origin, be it an upland lake, natural or artificial, or a deep well free from pollution, or be it a shallow well or a river, polluted or liable to pollution. For convenience, the subject of the efficiency of these filters may be dealt with under five headings: (1) Suspended matter; (2) presence of iron in solution; (3) colouring matter; (4) plumbo-solvent action; (5) bacterial content.

Before considering these separate headings it may be appropriate to notice the change in the general chemical composition of the water brought about by the mechanical filter. On the general chemical results I place no importance. The chemical changes resulting from mechanical filtration have been put forward as percentages of purification; but those who put forward chemical results in this way miss altogether the significance of chemical analysis. Chemical analysis of water had originally as its object, before bacteriology was placed in such a secure position, the detection of sewage pollution; in other words, the detection of matter which is dangerous by reason of its perhaps containing pathogenic organisms such as Bacillus typhosus. If the extent of the chemical change in filtration gave any indication of the presence or absence of pathogenic organisms, then it would be of the greatest value; but the results of chemical analysis give no such indication. From the hygienic point of view, I am, therefore, not interested in the reduction of free or albuminoid ammonia in filtered water. What I am concerned about is the improvement from the æsthetic and the physiological standpoint; whether the suspended or colouring matter, or plumbo-solvent action is removed, or whether injurious bacilli have been eliminated. Beyond this, chemical results are of secondary concern. However, as a matter of general interest it may be stated that the greatest change in the water on being passed through the filter is that the albuminoid ammonia and the amount of oxygen absorbed are decreased.

The following table gives the analyses of water from three supplies, before and after filtration, through mechanical filters of different types:—

	Swinyshaw Reservoir, Mather & Platt's Delphic.		Shrewsbury. Bell's Blunt.		Reading. Candy's—Smith	
	Unfiltered	Filtered	Unfiltered	Filtered	Unfiltered	Filtered
Oxygen absorbed	0·1150	0·0522	0·090	0·044	0·150	0·030
Free ammonia ...	0·0138	0·0128	0·0050	0·0045	0·002	0·001
Albuminoid ammonia	0·0380	0·0133	0·021	0·007	0·023	0·008
Nitrous nitrogen	0·0	0·0	0·0	0·0	Slight trace	0·0
Nitric nitrogen	0·124	0·118	0·145	0·150	0·40	0·40
Chlorides	1·17	1·18	1·1	1·1	1·40	1·30
Hardness—temp.	0·0	0·6	0·2	0·2	11·0	11·0
Hardness—perm.	3·3	3·8	4·3	4·3	4·70	4·70
Nature of source	Moorland		River		River	

Taking the results into consideration one is led to conclude that the general effect of filtration through each of these three representative filters is practically the same.

SUSPENDED MATTER.

In the removal of suspended matter from the water there can be no question of the efficiency of mechanical filters of whatever make they may be. That they render the water clear, as tested by the 2-ft. tube, is testified to by many observers throughout the country. The effect of filtration is most markedly seen in dealing with very turbid water for example, from a river in flood. No severer test could be applied than in dealing with the water from the Severn, which is liable to heavy flooding, and which at times contains a very large quantity of insoluble solids. During spring and summer the flow of the river remains fairly constant as regards suspended solids, and at those times alumina is added to the extent of 1¼ grains per gallon; but during the autumn and winter when the river is high and floods are common, the amount of alumina added may be raised to 2½ grains per gallon. The clearer the water the less alumina is required. In the summer months the filters are cleansed every twelve hours, but on some occasions during the winter, and fortunately these are few, it may be necessary to wash out the filters every six hours and even every four hours. . . .

The chief difficulty in clarifying the water is the presence of the argillaceous or clayey matter. This fine material sediments slowly. I have several times allowed the 2-ft. tube to remain upright for twelve hours, and found that the fine particles had not sedimented even in that time. In dealing with such a water, sedimentation after adding the coagulant, but before passing through the filters, would relieve the work of the filters, and so bring about a better filtrate. Another factor to be considered is that the river may rise quickly, and those in attendance may be taken by surprise before the requisite proportion of alumina is added.

This flood water is very difficult to deal with by any kind of filter without preliminary sedimentation, and perhaps the mechanical filter is preferable to the slow sand filter, which would soon become clogged by the sedimentary material. . . .

PRESENCE OF IRON IN SOLUTION.

Iron may be found in solution in water from deep wells. It exists in solution in the ferrous state by reason of the presence of carbonic acid, and in the presence of air becomes oxidised, and is precipitated, after which simple filtration will remove nearly all the iron present. If the water is free from pollution, which is probable in the case of a deep well, treatment is only required for the removal of iron. Here the installation of mechanical filters may be all that is necessary.

In the process of removing iron in solution the water must be aërated to cause oxidation and precipitation. In the Candy filter which is in use for this purpose at Hastings, Tunbridge Wells, Cromer, and other places, the aëration is conducted within the filter. With the other filters oxidation is performed by aëration in a separate aërator. At Crewe the use of Bell's filters after aëration of the water in reservoirs is effective in removing all the iron present. At Newquay, the Mather & Platt filter, with an aërator, produces the same result. Candy filters at Hastings, Tunbridge Wells, and Cromer have proved a success in removing practically all the iron originally present in the water. Provided aëration is sufficient for complete oxidation, simple filtration through the mechanical filter is all that is necessary for the removal of practically all the iron present.

COLOURING MATTER.

There appears to be no doubt that mechanical filters act more efficiently than slow sand filters in removing peaty colouring matter. The alumina used in most of the types of mechanical filters seems to form a film which effectively arrests most of the colouring matter, perhaps by a specific mordant action. Again, the polarite of the Candy filter appears to have a selective action on the peaty bodies which give rise to brown colour of the water. It cannot be questioned that the action is a marked one. . . .

PLUMBO-SOLVENT ACTION.

Plumbo-solvent action is commonly found in moorland waters, the property being due to the presence of peaty acids, which impart an acid reaction to the water. . . . To counteract the action of peaty acids, neutralisation may be carried out, as is done in the process of mechanical filtration, by the addition of lime or sodium carbonate, which is added in sufficient quantity to neutralise the acidity and at the same time re-act on the alumina added to force the coagu-

* Extracts from paper read at a meeting of the Royal Sanitary Institute, held at Shrewsbury on May last.

limit, or, in the case of the filter not using coagulant by the addition to the filter bed of magnesium oxide, which is slowly dissolved out.

Very careful investigations have been conducted by several observers especially with regard to two types of mechanical filter in which coagulant is used. Frankland, in making observations on the Stockport water before and after filtration through Bell's filters, found that the plumbo-solvent was reduced by 76·3 per cent, taking the average of a year's weekly samples. Delépine ascertained that the action of moorland water on lead, after chemical treatment and passage through Bell's filters, was considerably reduced and rendered negligible. . . . Ross and Race, studying both Mather & Platt's and Bell's filters, obtained somewhat similar results, the plumbo-solvent action being reduced to a very small amount or completely abolished, and the water giving a definite alkaline reaction.

Although the methods of determination adopted by these observers were different, their scientific accuracy may be taken for granted. These results, coming from men of a high reputation, give expression to the remarkable efficiency of this method of treating water possessed of a plumbo-solvent action which is dangerous to consumers.

BACTERIAL CONTENT.

. . . The bacterial content of the water need only be considered in relation to the filtration of water which is polluted, or suspected of being polluted, by excremental matter. Upland or deep well waters are likely to be beyond reproach, and the effect on the bacterial content is only of secondary importance.

In the first place it is necessary to allude to the fact that until a sufficient mat of bacteria and algæ forms on the surface of the filtering material, the maximum efficiency of the filtration process cannot be expected. This film, however, quickly forms, and Ross & Race, experimenting with both Bell's and Mather & Platt's filters, found that, under ordinary circumstances, after washing, the percentage of purification obtained at the end of ten minutes' working of the filters was 91·9 and 94·7 respectively.

In my own experiments carried out at Newcastle 1910, I found that Bell's filters, two minutes after washing, gave a percentage purification of 91·9 and 87·0 respectively, in two experiments; and fifteen minutes after washing a percentage purification of 95·9 and 92·4 respectively. The time between washing and efficient action of the filter is thus so small that it may be neglected.

As to the bacterial efficiency of mechanical filters, Frankland showed that, working with Bell's type, an average of 95·7 per cent purification could be obtained. This average deals with a year's weekly samples of the unfiltered and filtered waters, the unfiltered water containing from 45 to 795 bacteria per c.c. and the filtered water from none to 45 per c.c. This water was obtained from an upland source not exposed to pollution. At York, where mechanical filters are used for preliminary treatment instead of storage before filtration through slow sand filters, the average reduction in the bacterial content of the water, which is obtained from the Ouse, was found to be 86·2 per cent without the use of a coagulant; but with the addition of 1 grain per gallon of sulphate of alumina, in an experiment lasting six days, an average reduction of 93·37 per cent was obtained. At Bolton, where Mather & Platt's filters are in use, Ratcliffe (quoted by Ross and Race) found in a series of weekly examinations extending over fifteen months that the average reduction of bacteria was 95·6 per cent. Here the untreated water contained from 52 to 795 organisms per c.c. Delépine points out that, if the number of bacteria in the untreated water is very small, little reduction in the number is made by filtration; when the number of bacteria in untreated water does not exceed 5, 10 or 20 per c.c., very little improvement can be expected from treatment. The results of Ross and Race bear out these observations. Bell's and Mather & Platt's filters were kept under supervision by these observers, and 74·7 and 75·9 per cent purification respectively were found in dealing with water containing from 40 to 95 bacteria per c.c. in the original condition. Both Delépine's and Ross and Race's results were obtained from water which did not require filtration for the reduction of bacteria, but which was being filtered mechanically for other reasons.

During the first year of operation of Bell's filters in Shrewsbury analyses gave an average purification of only 73·3 per cent, but after the treatment was adjusted, and certain defective valves in the chemical apparatus were corrected, the bacterial purification was found towards the end of 1910 to be from 95·9 to 96·6 per cent. Recent samples taken a few weeks ago gave successively 96·1, 94·1 and 95·6 per cent purification. At Edinburgh, with the same class of filter, a similar result was obtained—a percentage reduction of from 67 to 81 in the earlier periods of testing, but a greater reduction when the chemicals were adjusted, the washing regulated and the filters kept under careful supervision. These experiences point to the necessity of careful and intelligent supervision of the filters, checked by bacteriological examination, so as to determine the amount of coagulant to be used and the periods of washing. The Mather & Platt and Bell filters have been found to act in an equally efficient manner when compared under the same conditions, and it is probable that the Paterson filter, acting, as it does, on the same principles, has the same efficiency. With regard to the Candy filter, no extended bacteriological results appear to be available, and one is inclined to be sceptical as to its equal efficiency when no coagulant is used. Extended observations are required to improve our knowledge of the comparative value of all these types of mechanical filters.

There is a serious source of fallacy in speaking of the bacteria in the filtered water as so much per cent purification, for the ultimate bacterial content may be large, although the percentage would indicate a large amount of purification. For example, the water of the Severn may contain anything from 143 bacteria per c.c. in the dry-weather flow in summer to 9,920 per c.c. in winter high-level flow (flood water in all probability will contain more than this); but 94 per cent purification in the former would result in 8 bacteria per c.c., and in the latter 590 per c.c., the latter the result of an actual analysis. On another occasion, as already noted, when the river water contained 8,000 per c.c., the filtered water gave 290 per c.c.—equal to 96·4 purification. This amount of purification cannot convert a polluted water into a potable one. For total bacteria in potable water the general view is that it should contain more than 100 bacteria per c.c.; but less than this amount does not render a water potable, since the presence of B. coli and its relatives must be considered. Houston, perhaps, expresses the general view of bacteriologists regarding the subject when he states: "Everything depends on the local circumstances, and a standard suitable for one place may be too high or too low for another. . . . Hence it may be said that there seems no convincing reason why, generally speaking, the absence of typical B. coli from 100 c.c. of water in a majority of representative samples should not be taken as a 'working standard.'" Were the water passing through the filters at Shrewsbury intended for potable purposes (which it is not, since another pure supply is available), the extreme limit of absence of B. coli in 100 c.c. would have to be required, since the river is known to be polluted by sewage. Severn water almost invariably contains B. coli in 1 c.c., and sometimes in $\frac{1}{10}$th c.c., and the filtered water contains usually B. coli in 50 c.c., and sometimes in so small a quantity as 10 c.c. In the samples taken four weeks ago at several days' interval, B. coli were found in 1 c.c. of the river water, and in one out of three 10 c.c. tubes of filtered water. This result cannot be considered satisfactory from a hygienic point of view.

It may appear irrelevant to quote Shrewsbury results, since the water is not used for potable purposes; but I have in mind other towns which receive their general water supply from rivers, only mechanical filtration being employed for purification before reaching the consumer.

These filters have no selective action on B. coli, and so not on *B. typhosus*. *Bacillus coli* is taken to be an index of danger of pollution by *B. typhosus*. Should the water be polluted from the discharges of a typhoid patient, the filters, while acting as a medium of dilution of the poison, would not act as an effectual safeguard. On this account mechanical filtration alone cannot be depended upon to render a polluted water, or one supected of pollution, satisfactory for potable purposes.

Recourse must be had to other methods of rendering the water safe—for example, preliminary storage or sterilisation. Preliminary storage for a sufficient length of time, as recommended by Houston, will render the water free from *Bacillus typhosus*, the number of other bacteria being lessened at the same time. Houston recommends thirty days' storage, although, from the results of his experiments to determine the viability of "uncultivated" typhoid bacillus in water, one would consider a fortnight a

sufficient length of time to render the water practically "safe." In his observations on raw Thames water stored for about fifteen days at Chelsea, he found that the organisms were reduced, taking one year's samples, on an average 95·3 per cent, the B. coli content being also reduced proportionately. If the typhoid bacillus is killed by sufficient storage, mechanical filtration, it may be concluded, is all that is necessary for the stored water to reduce the total organisms to an amount which cannot be objected to, and to render it fit for potable purposes. Further, storage accommodation could be the means of excluding flood water, and so equalising the quality of the raw water, and avoiding undue strain on the filters. If, as stated by Houston, slow sand filters without preliminary storage will remove 98 per cent of the bacteria, mechanical filtration, which removes well over 90 per cent, should be all that is necessary for water which as been stored for a sufficient length of time. At York, mechanical filters without coagulant are used instead of storage to reduce the number of organisms, the filtered water passing on to slow sand filters before being supplied to the consumer, the total bacterial content being reduced by both processes to 99·1 per cent. I should, however, consider storage with mechanical filtration preferable to mechanical filtration plus low sand filters as possessing a greater degree of safety.

As to sterilisation of water, I shall simply allude to our experience of sterilisation at Shrewsbury. As I have already stated, the river water is not used for potable purposes; but to render it safe, should it be so used, it was decided to treat it with an antibacterial agent. On the recommendation of Dr. Rideal, "Chloros," a trade name for sodium hypochlorite, which has 12 per cent available chlorine, was employed, and gave striking results. The treatment was commenced in June, 1910, and has been employed ever since with small intervals for experiments. By experiment it was found that 1 part of chlorine to 2,000,000 parts of water rendered the water practically sterile, without a trace of chlorine being evident on testing by means of starch and potassium iodide. When the treated water is examined in quantities of 3 c.c., organisms are usually absent, although at times there may be as many as 12 organisms per c.c. present. But the striking result is in the B. coli content. Repeated examinations have shown B. coli to be absent in 250 c.c. of water, and in a few examinations made of 500 c.c. a negative result has been obtained; the water may therefore be considered a safe water even for drinking purposes. As to the presence of chlorine in the treated water, no complaints have been made since the first few days of the experiments, when 1 part of chlorine in 1,000,000 parts of water was added, and then it was detected by the starch and iodide test; but daily testings for free chlorine, from July 11, 1910, to December 6, 1911, gave consistently negative results.

In this country there is some prejudice against the addition of chemicals to water for the purpose of purification, and it may be appropriate to consider at this point whether any alumina passes through the filters into the general supply. Delépine found no excess of alumina in the treated water over the untreated. Molyneux, at Stockport, found a film on the bottom of the service reservoir, which has a storage capacity of twenty-four hours, and through which 400,000,000 gallons of water had passed in the eighteen months before being inspected.

At Shrewsbury the service reservoir, with a capacity of slightly over 250,000 gallons, was found, after a year, to have a film of brownish flocculent material of a thickness of ½ in. over the bottom. This film was found to be composed chiefly of hydrate of alumina and iron, derived, presumably, from the coagulant added. The capacity of the reservoir allows an average rest of five hours for the treated water before reaching the consumer, and gives sufficient time for sedimentation; but when one considers that over 400,000,000 gallons of water passed through the reservoir in twelve months, the small amount of deposit may be considered negligible. Repeated tests of the filtered water as supplied to the consumer have failed to show the presence of alumina, so that it may be accepted that if alumina does pass through the filter at times, its amount is negligible from the physiological aspect.

MERITS OF MECHANICAL FILTERS AND SLOW SAND FILTERS.

There is ample evidence that, under ordinary circumstances and with careful supervision, the slow sand filter is slightly more efficient in reducing the number of bacteria present in the raw water. The reduction, however, varies just as with the mechanical filter in accordance with the amount of care devoted to the management of the filtering process. Even with careful management the results with the sand filter may not come up to one's expectations. Houston states that the slow sand filter removes 98 per cent of the bacteria, but at Bolton a comparison of the results of slow sand filters and mechanical filters dealing with the same water showed a percentage purification of 88·8 for the former and 95·6 for the latter.

For the removal of suspended particles, colouring matter, iron in solution, or plumbo-solvent action from a water derived from a source free from human pollution, the mechanical filter appears to be the filter of choice. But, given a water polluted, or suspected of being polluted, without sufficient storage of raw water, or without sterilisation of the treated water, the slow sand filter gives a slightly greater measure of safety. Mechanical filtration combined with storage, however, can be depended upon to give a water which can be considered satisfactory from a public health standpoint. Whether sterilisation of a polluted water can be depended on under all circumstances remains to be proved. So far it has not had a sufficient trial.

In tropical countries, and in active warfare, mechanical filters, combined with a sterilisation process, seems the best method of coping with the difficult conditions.

Further advantages of the mechanical process over slow sand filtration are less capital cost, variously estimated at one-third to one-half that of slow sand filters; economy of space; working under cover; ease of management and cleansing; no interference of supply during cleansing; and less cost of maintenance. Ross and Race have estimated the maintenance charges in connection with a slow sand filter, and with mechanical filters of two types dealing with the same water. They found that the cost per 1,000,000 gallons of water treated by sand filtration was 12s. 11d., and by the mechanical filters 9s. 8d. and 9s. 7d. respectively. These observers give the capital cost of the filters per 1,000,000 gallons of water filtered as £7,989 10s. for the sand filters, and £3,623 4s. and £3,458 4s. respectively for the two types of mechanical filters—Bell's and Mather & Platt's—and the yearly cost per 1,000,000 gallons of £1 13s. 3d., £1 3s. 7d. and £1 2s. 10d., calculating on the loan periods allowed by the Local Government Board. Delépine quotes Dixon, who gives the cost of dealing with 1,000,000 gallons of water by means of Mather & Platt's filters as 9s. 5d. for treatment and maintenance, and an annual cost of 14s. for one installation, and 14s. 8½d. per 1,000,000 gallons for a second installation, taking the annual charges on capital on a forty years' loan basis.

Mechanical filtration, therefore, possesses considerable advantages over slow sand filtration, the chief being the lower capital outlay and the lower maintenance cost. Taking into account the efficiency of these filters, along with the economy in their installation and management, I believe that slow sand filters will be superseded in many cases where formerly they were considered absolutely essential.

[A report of the discussion which followed the reading of the foregoing paper will appear in next week's issue.]

Institution of Gas Engineers.—The annual meeting of the Institution of Gas Engineers was held on Tuesday in London, the president, Mr. John Bond, engineer and manager of the Southport Corporation gas department, in the chair. There was a large attendance of members from all parts of the country. At December 31st last the membership roll of the institution bore 881 names, as compared with 875 at December 31, 1913. The number is made up thus—honorary members, 27; members, 738; associate members 111; associates, 2; students, 3.

New Library for Bradford.—The Lord Mayor of Manchester recently opened a new public library at Bradford. When the district was incorporated with Manchester the town hall in Brooke-street was left vacant by the abolition of the old local board, and the building was utilised by the corporation as a reading-room. This was opened in 1887. Two years later a juvenile library was opened in one of the lower rooms, and a lending library was afterwards added. The new library, which has cost, with equipment, £4,000, has taken the place of the old building. The city architect has designed it.

NATIONAL GUARD ENGINEERS AT BRIGHTON.

A detachment of the Engineers' Unit of the City of London National Guard Volunteer Corps took part in the Whitsuntide manœuvres of the regiment at Brighton. The Engineers were engaged in various field operations under the command of Platoon-Commander W. Neptinstall Millar, instructor to the unit, by Sergeant-Major Collier, R.E. (T.).

On Saturday the Engineers took measurements and prepared sketch drawings for a military bridge of 50ft. span across the road to Newmarket. Afterwards set out a full-size longitudinal section of the bridge, the structural members being represented by tapes pinned down upon the grass. During these and other operations the Engineers were protected by a covering party of infantry under Platoon-Sergeant A. J. Wall, this party having been detailed from the company in charge of Platoon-Commander W. Heptinstall Millar.

On Sunday morning the detachment was engaged in surveying a site at Patcham suitable for the establishment of headquarters. The survey was conducted under the direction of Sapper R. F. Harvey, M.INST.C.E., by whom a sketch plan was prepared.

On Whit-Monday the Engineers visited the new ferro-concrete sea walls and groynes at Roedean and Rottingdean, where the principles of construction were explained by the officer in command. In the afternoon a reconnaissance was made across the Downs preparatory to the selection of a defensible position. An ideal position of the kind was found to the north-east of Rottingdean, and on it lines of trenches were pegged out, a plan of the works and surrounding country having been drawn by Sapper H. Smith.

On Tuesday morning the unit were occupied in setting out on the grass full-size longitudinal sections of two variations of the bridge design prepared on the previous Saturday, and this concluded four days of practical training of a particularly interesting and instructive character.

Council Surveying Party Arrested at Altcar.—Three officials of the West Lancashire Rural District Council—Messrs. John Wignall and H. Harr (surveyors), and Mr. J. Holland (road foreman), all of Ormskirk—had an unpleasant experience on Wednesday. They were engaged in surveying land with plans in their possession at Altcar, near Formby, which is within the council area, when the suspicions of a military guard close by were aroused, and they were placed under arrest. Explanations were useless, and for nearly seven hours the officials were detained in the guard-room until identified by a police inspector who formerly lived at Ormskirk.

STAFFORDSHIRE MAIN ROADS.

COUNTY SURVEYOR'S TWENTY-FIFTH REPORT.

An interesting fact in connection with the annual [illegible] presented [illegible] by Mr. J. [illegible] Moncur, M.INST.C.E., county surveyor of Staffordshire, to the Main Roads and Bridges Committee of the Staffs County Council, is that it was the twenty-fifth record of a similar kind which that gentleman had prepared.

Motor traffic (Mr. Moncur states) has unquestionably for some years past been causing great deterioration of the upper crust of many of the main roads, and, unfortunately, it is now adversely affecting the foundations of our strongest and best-constructed roads. The movement of military self-propelled vehicles for the Front, and also military equipment and stores in many parts of the county during the past winter, formed no small proportion of the increased tonnage that the roads have had to carry. The increase in the motor-omnibus traffic, which, in my opinion, is the heaviest and most destructive road traffic, has unquestionably done the most damage, and the effect of the past winter has reinforced my opinion that ordinary macadamised roads are wholly unsuited to bear the strain of such traffic.

The deterioration of the main roads, which is self-evident, is probably due to three causes—(*a*) the great increase in traffic, both in volume and weight, which they have had to bear, (*b*) the amount expended annually has not been sufficient to meet the annual wastage, and (*c*) the traffic has been far greater and heavier than the roads were originally constructed to carry. Sudden failure or collapse of some roads is, no doubt, also in a large measure due to the age of the water-bound coatings.

In one of my previous reports I pointed out that the older macadamised coatings were standing better under the modern traffic than the newer coatings, and this fact no doubt accounts to a certain extent for the increased mileage of unsatisfactory road surface, as the imperative renewal of the old surface diminishes the old area and increases the area of the new. The resultant injury to "green" coatings can never be effectually repaired, no matter how carefully they may be patched and attended to—or, in other words, once damaged always unsatisfactory.

The Motor Car Act came into operation in 1903 and the Heavy Motor Car Order in 1904, both of which revolutionised traffic on roads. This self-propelled traffic led to an enormous increase of light and heavy traction-engine traffic, and the result is a regular procession of all kinds of traffic on some of our leading lines of road giving them more the appearance of railways than roads. Notwithstanding this radical change in the character of the traffic, I think it is a matter for thankfulness that the roads have been able to sustain such traffic so long. This is doubtless largely due to the substantial work carried out in the first years of the county council's control of the roads.

CORRUGATION.

Railway and tramway engineers have been exercising their minds for some time to explain the reason of the phenomenon of rail corrugation, which practically dates from the time electricity was introduced as the motive power, and to devise, if possible, means of overcoming the difficulty, as immediately corrugation is set up rapid deterioration and ultimate destruction of the rail soon follows. It is contended by some engineers that the small diameter wheels, together with the low centre of gravity, account for this, while others contend that it is largely, if not entirely, due to the chemical composition of the rails, and others the manner in which the rails are made.

Road engineers have now exactly the same phenomenon to contend with, the difference being that, in the case of rails, the corrugations are comparatively small, and not noticeable unless on very close inspection; but the "roar" of the car, even to the uninitiated, unpleasantly indicates that things are not as they ought to be. If steel rails are liable to corrugation under the traffic they have to carry, it is not surprising that corrugation should form on ordinary macadamised roads subjected to modern traffic.

Modern traffic is specified advisedly for the simple reason that none of the 600 miles under our direct control had shown the slightest indication of a wavy surface until comparatively recent years. This is, in my opinion, due to the concentrated weight on comparatively narrow wheels of small diameter being propelled at exceptionally high speeds. There is no

doubt also that the unequal distribution of the load contributes to this result. For instance, something like 75 per cent of the weight is on the hind or driving wheels of most self-propelled vehicles. This is done with the view of facilitating the steering and also increasing the propelling power of the machine; but I am convinced that if the loads on both the front and hind axles were brought more into harmony the corduroy surfaces now obtaining on most roads would, to some extent, be done away with.

SCIENTIFIC ROAD MAKING.

The successful road engineer in pre-motor days was he who could vary and adapt his system of maintenance amply to sustain the traffic (heavy or light) under all conditions of weather on all classes of subsoil at the minimum cost, or, in other words, who built and maintained his roads with the smallest margin of strength in excess of that which was absolutely necessary for the traffic—success, I need scarcely point out, being also, in a large measure, due to the tactful handling of the roadmen to get them interested in their work, and, above all, training them to be observant, and especially to take note of the result of every act of their daily work. In fact, in former days the great majority of the lengthsmen were so well acquainted with every yard of road under their charge, and the traffic they were likely to carry, that at all seasons of the year and under all conditions of weather they did the right thing at the right time with comparatively little instruction or supervision.

Such men and such work will always be necessary on certain classes of roads, but I am afraid the time has come when it will be necessary to build and maintain heavily trafficked roads on more scientific lines. Modern traffic demands not only a more solid, a more durable and a smoother surface, but, in addition, it must be constructed and maintained with the minimum of discomfort to users of the road. Everything, therefore, points to the work of road maintenance being largely carried out in future by gangs of men under foremen closely supervised by specially qualified assistant surveyors.

COST.

Roads, unquestionably, are to cost in future much more to construct and maintain than they have done in the past, and it will therefore be so much the more necessary for the road engineer to consider well the local conditions—such as subsoil, drainage, gradient, the extent and kind of traffic—before determining on the mode of dealing with a particular road. All roads—even all main roads—are not carrying the same kind and volume of traffic, and consequently there will be ample scope for varying the system of maintenance to meet the varied and different conditions. Even on the same road carrying the same traffic throughout its entire length it may be advisable, and even necessary, to vary the character of construction owing to (*a*) different kinds of subsoil, (*b*) varying gradients, (*c*) the want of gradient, and (*d*) the shading of the road by trees, or the existence of a cutting.

With regard to (*b*) and (*c*): In the horse traffic period level roads were less costly to maintain than those with gradients, and the cost increased in the ratio of the increase in the gradient. This was obviously due to the hammering and tearing action of the horses' feet in their effort to climb the hill, and in a lesser degree in straining and slipping to keep back the load in going down hill.

Modern traffic (excepting traction engines with diagonal bars on the driving wheels), however, has completely reversed this condition of things. On gradients there is not only a lateral or cross fall, but a longitudinal fall as well, with the result that water does not lie on the surface. In the case of level roads there is only a lateral fall, and even that is comparatively slight so as to enable the traffic to use the full width of the road, and the consequence is if there is the slightest depression on the surface water will lodge, and by the action of the fast moving traffic the depression soon becomes a hole, which, if not promptly attended to, induces the formation of a succession of holes.

I have on many occasions pointed out how difficult it is, if not almost impossible, to maintain satisfactorily a macadamised road by the side of a tramway track, and I am now convinced that on certain lengths subjected to heavy motor and motor-omnibus traffic nothing short of paving with granite setts laid on a concrete foundation will suffice. There are also roads, such as the Walsall and Birmingham road, which should be similarly paved the full width.

Up to the present, all improvement and maintenance on the 600 miles of main roads under direct control have been paid for year by year out of revenue, but as the "life" of sett paving on concrete is anything between thirty and forty years, such work should be carried out with borrowed money, for the reason that it will ease the burden of the present ratepayers, and the next generation, who will partly reap the benefit, will carry part of the burden. Borrowing, of course, would only be resorted to when the expenditure was clearly of a capital nature.

In the case of the Walsall and Birmingham road, it tumbled to piece in two or three months' time. Prior to that the road was sound and in good order, and no difficulty was experienced in maintaining it with macadam, although it has, of course, been costing considerably more to maintain since the introduction of self-propelled vehicles. This is the first winter of the motor-omnibus traffic, and it, together with the additional heavy motor and traction engine traffic, has proved more than the road could carry. It is therefore evident that in such a case the necessity for altering the constructional character of the road is entirely due to self-propelled traffic, and consequently the Road Board ought to assist substantially in meeting part of the cost.

On a large number of our roads the great bulk of the traffic that passes over them is county borough traffic, and the Walsall and Birmingham road is a clear and obvious case in point. In fact, I make bold to say that more than nine-tenths of the traffic on this road is not county traffic at all, but either Walsall or Birmingham traffic, and neither community contributes one penny towards its upkeep, and this is another reason why the Road Board should assist.

TAX ON VEHICLES.

In turnpike days the actual users of the road paid for their maintenance, which, generally speaking, was equitable and fair, but although the toll bar has gone for ever, it should not be beyond the wit of man to determine and fix a tax for all vehicles that would to a certain extent be commensurate with the amount of damage done by them, and if the money thus obtained were spent in improving the roads a proportional benefit would accrue to the owners of vehicles in a considerable reduction in the cost of the upkeep of the vehicles and, besides, increased loads might be carried.

On motor-omnibus routes, for example, it is obvious that with an improved road the service would be more regular, there would be more comfort in travelling, thereby inducing more to travel, and, as in the case of ordinary vehicles, a perfectly satisfactory road would lead to a reduction in the cost of the upkeep of the omnibuses. This appears to me to be a traffic that certainly ought to contribute direct to road constructional work, as the omnibus company are using the roads as a tramway company would, but are relieved of the expense of constructing and maintaining a track.

Fortunately, it will not be necessary to alter the construction of all the roads, but I think it is fairly obvious, even to the casual observer, that some other mode of construction and manner of maintenance will require to be adopted on many of the leading lines of road, and it will be a matter for serious consideration to determine the best mode of reconstruction to adopt in each case so as to obtain good roads at the minimum of cost.

Surveyors' Institution Membership Roll. For the first time in the history of the Surveyors' Institution, the council of that body have to report a reduction in the number of members, the total in May, 1915, being 5,385 compared with 5,482 twelve months ago, due to a diminution of 107 in the number of professional associates, and 35 in the number of students. "Doubtless," the council remark in their annual report, "the war has had some effect in contributing to this result, but it was anticipated in the council report of last year, when it was pointed out that the exceptional increase in numbers which had taken place during the previous two years was caused by the desire of intending professional associates to enter prior to the closing of the doors to those who had not passed the final as well as the intermediate examination. The supply has now been shut off, and will not again become normal until a considerable accumulation of men who have passed the intermediate exists, from which the final examination and the balloting list may be recruited." The receipts for the year 1914 reflect the reduction in the membership. Considerably over 1,000 men connected with the institution are serving with His Majesty's Forces.

Assistants' and Students' Section.

Conducted by SYDNEY G. TURNER, Assoc.M.Inst.C.E.

All communications in regard to this page must be addressed to The Editor, St. Bride's House, 21 Bride-lane, Fleet-street, E.C. Envelopes must be marked "Assistants' Section" in the top left-hand corner. Correspondents are invited to submit questions for consideration and answers to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.

THE MONTHLY PREMIUM.

The competition for May is divided between

Mr. M. T. [illegible],
Carlisle,
Graduate [illegible],
[illegible],

and

Mr. J. Watson,
22 Mount [illegible],
[illegible]-hill,
Leeds.

[illegible] the papers sent in the present month [illegible] the best received during the past [illegible]

QUESTIONS.

Final work answers are invited to the following questions:

482. Water Towers. What are the chief points to be considered in the design of water towers, and how do they originate? Is there any book dealing with the subject? (Rev.)

483. Bridge Construction.—How are the lengths of the four wing walls of a bridge and the [illegible] angle between the bridge and each wall [illegible]? (Tee.)

484. Hydrostatics.—A square sluice opening, 3 ft. by 3 ft., is formed in the vertical face of a tank, and the upper edge of the opening is 6 ft. below water. Calculate the hydrostatic pressure upon the square area, and find the exact position of its centre of action. (A.M.I.C.E.)

485. Building Construction.—A casement window-frame is to be fixed in a cavity wall (9-in. stone to [illegible] an inner facing of bricks, and a 2-in. cavity). Show clearly the methods of fixing, and any important features with respect to the relation between the window-frame and the cavity. (Mercator.)

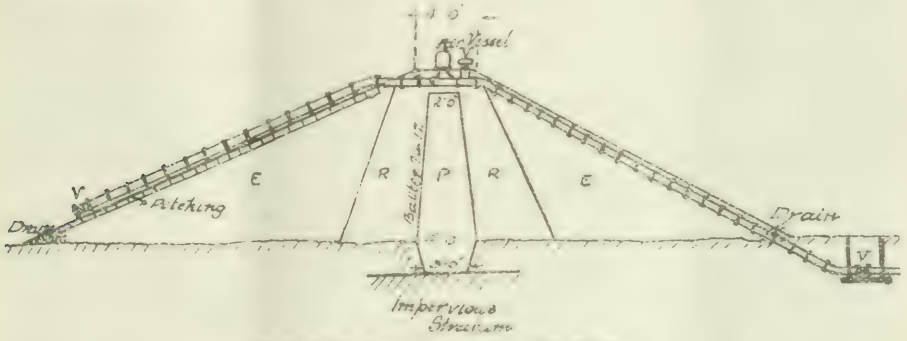
486. Sewage Ejectors.—How would you test the efficiency of a pair of 100-gallon alternating sewage ejectors with motor-driven air compressors? (C. A. B.)

[The Editor is at all times glad to hear from readers who desire to submit questions regarding matters of general interest, points of daily practice, &c., for insertion in the "Assistants' and Students' Section." Questions which are published are taken into consideration, as well as other matter, in awarding the Monthly Premium.]

REPLIES TO QUESTIONS.

479. Reservoir Dam.—Give sketch and description of an earth embankment, with clay puddle across a mountain brook 12 ft. wide, rising from each side of brook 1 in 2, the embankment to be 12 ft. high in the [illegible] bed. (R. P. M., *Towyn.*)

Before commencing the construction of the embankment all loose rock and other material should [illegible] the ends of the dam. The puddle trench should be carried down to [illegible] and great care must be taken to ensure that the trench is carried down to an impervious stratum, and that no water should pass from the reservoir under the puddle wall, or round the ends of the puddle trench. [illegible] at the puddle trench should be at one and the same level along its entire length, so that the [illegible] in the one which we are now discussing, the great object being to prevent unequal settlement of the puddle wall and the formation of cracks which might lead to leakage, and the consequent failure of the dam. The best method of working up the puddle is to dig and prepare it by cross-cutting, watering, &c., at the place where the clay is obtained, afterwards transporting it to the site of the embankment, where it is spread in layers which are not more than 6 in. thick, well compressed and thoroughly incorporated into one mass. The materials for the formation of the embankment should be obtained at or near the site of the reservoir, and, if possible, dug out from the bottom of the reservoir itself to increase the capacity of the same. The material available in this way often determines the form and section of the dam. The stuff, wherever obtained, should be sorted, and the materials of a finer and more retentive nature should be placed in the central portion of the dam to keep the puddle moist, the less compact being placed to form the outer parts of the dam. It is important not to make too sudden a change from material of one kind to others of different qualities, or which do not act together when subjected to pressure. The inner slope of the embankment is generally 3 to 1, but 2½ to 1 would be suitable in this case; it should be pitched over its entire area with stone 6 in. deep. The downstream slope should be at an inclination [illegible] and should be pitched. A good plan is to form toes to the slopes of any rocky material available, which, in addition to supporting the embankment at a weak place, also act as a drain to downstream slope, permitting any water which might accumulate therein to pass away. No large pieces of hard rocky material should be placed in the dam, as they would cause unequal settlement of the different portions of the embankment, while also reducing the cohesion of the materials. The embankment should be carried up in even layers, well consolidated by rolling or other method. An apron of clay is sometimes placed under the stone pitching of the upstream slope: but this is hardly necessary if the puddle wall is carefully formed, and abuts



[illegible] R. P. M. [illegible] P. [illegible]

Diagram [illegible] Reply to Question 479.

against impervious strata at its base and ends. The height of the embankment should be such that there is no danger of overtopping when the reservoir is full, or the stream in flood and a gale blowing downstream. As the height of the embankment is only 12 ft. in the river bed, a syphon outlet would be most suitable in this case. This type of outlet does not endanger the dam. The inner and outer ends of the syphon should be provided with proper valves which can be easily worked whether the reservoir be empty or full. The effective head necessary to work such a syphon is about 2 ft. A valve for extracting air from the syphon and for charging the same with water should be placed at the summit. If a rocky, impervious stratum occurs in the bed of the river where the dam is constructed, an outlet pipe or culvert can be founded on the stratum and allowed to penetrate the embankment under the puddle wall. With this arrangement we would be able to drain the water in the reservoir to a lower level than with the syphon outlet; but care should be taken by placing flanges on the pipe or culvert projecting into the bank to prevent the leakage of water along the outside of the pipe or culvert. The dimensions of the waste-water channel and weir should be large enough to prevent the level of the water in the reservoir rising higher than within, say, 3 ft. of the top of the dam. A low parapet wall might be constructed along the top of the embankment to prevent damage from waves. It is advisable to place the waste weir at one side, and, if possible, beyond the earthen dam. The waste weir should be constructed in masonry, and if contiguous to the earthen dam the latter should be carefully protected from scour by the formation of wing walls supporting the side slopes. A third method of forming an outlet conduit would be by tunnelling into one bank of the stream around the end of dam. The outlet would first be made, and would be utilised for the diversion of the stream during the construction of the dam. (M. T. R., *Rhyl.*)

480. Sewer Survey.—It is required to survey the course of an old brick sewer, 5 ft. diameter, which runs for 1,000 yds. in a very irregular line in a thickly populated district. There are no available manholes. How can this be done, and what instruments would be used? (W. S. W., *Chesterfield.*)

A somewhat similar procedure to that used in the case of the setting out of a railway tunnel would be adopted. It is assumed, for the purposes of this question, that the sewer is open at both ends, so that the position of the same may be ascertained and plotted on the plan in the ordinary way. The actual survey inside the sewer would be carried out with the theodolite, an observation being taken at each end of the sewer on to some fixed object, such as the corner of a building, the position of which is already on an ordnance map. Measurements must be taken in order to fix the position of the axis of the theodolite at each end. The survey itself may be carried out as a magnetic bearing survey, but, as the district is thickly populated, it is safe to assume that there would be gas and water mains in close proximity, and that there is therefore the risk of an appreciable attraction of the compass needle due to this cause, which would seriously affect the accuracy of the work. In view of this the wiser course will be to make an underground traverse survey, merely taking straight lines along the floor of the sewer, and obtaining the angles at changes of direction in the ordinary way. Curves, if any, can be obtained by offsets from a straight line taken in as long a length as the curve will allow. A check on the work is afforded, since the positions of the commencement and finish of the survey are fixed, and the lengths and directions of the straight lines forming the main chain line should check in to a reasonable degree of accuracy. The theodolite and poles used in the work will, of course, have to be illuminated. All important connections encountered should be plotted. Should a section of the sewer be required, it may be obtained by taking levels along the entire length of the invert and reducing the various levels to ordnance datum by connecting the chain of levels to an O.B.M. at each end. A short staff, about 4 ft. 6 in. long, would be required, with a lamp for illuminating the graduated side, and the tripod of both the level and the theodolite must be either a special one with short legs or one of the telescopic variety, such as are used in headings. Should it not be possible to take an observation at each end on to a fixed object, owing to the ends of the sewer being below the level of surrounding points suitable for use in observations, the position of the manhole or other connection to the ends can be fixed in the ordinary way, and a plumb line can be dropped down, the vertical axis of the theodolite being adjusted so as to be directly below the bob. On measuring the position of the end of the line at ground level, we have also the position of our instrument. (B. K., *Newport.*)

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of Surveyor readers with a view to making the information given under this head as complete and accurate as possible.

INQUIRIES HELD.

Branston R.D.C. (June 1st. Mr. A. W. Brightmore).—£3,800 for works of sewerage.—It was stated that originally a much larger scheme was contemplated, the expenditure being estimated at £21,600, but owing to the difficulty of raising loans at present a modified scheme was prepared. The surveyor, Mr. T. Howitt, explained that the Boultham estate was being developed for residential purposes. There were already 191 new houses in existence. It was contemplated that eventually the scheme would serve about 3,120 houses.

Chapel-en-le-Frith (May 19th. Mr. W. O. E. Meadows) ... £3,250 for new works in connection with the Chapel and Fernilee water scheme, and £700 for the construction of a reservoir at Dove Holes.—It is proposed to purchase additional springs at the Neek, Fernilee, and to erect a pumping plant. It was desired that the repayment of the loan shall be spread over as many years as possible. Mr. J. B. Boycott, the clerk, requested that the loan should be granted at once. The sewage scheme was now complete, and additional water was needed for the conversions to the water-carriage system and for baths.

Clayton U.D.C. (May 27th. Mr. Edward Leonard).—This was an inquiry relative to the accommodation for the housing of the working classes in the district.—The clerk, Mr. W. Sheard, said he was instructed to say that at present the council did not consider a scheme necessary. Dr. Stanfield (medical officer) expressed the view, however, that there was a need for houses, and a dozen would meet the difficulty. The great necessity was houses with two bedrooms, an attic, and a kitchen and scullery. The rents should be from 6s. 6d. to 7s. 6d.

APPLICATIONS FOR LOANS.

Larne R.D.C.—£360 for a water supply for Woodburn.

Stalybridge Tramways and Electricity Board.—£4,000 for electricity transformers and mains.

Rawmarsh U.D.C.—£2,000 for a drainage scheme for the south ward.

Southgate U.D.C.—£1,800 for the construction of a public convenience.

LOANS SANCTIONED.

Billericay R.D.C.—£270 for the purchase of a site at Hutton for outfall works.

Gloucester T.C.—£1,500 for electricity extensions.

Willesden U.D.C.—£1,112 for an electricity feeder cable.

Derby T.C. — £25,090 for electricity purposes; £8,190 for the purchase of land for recreation ground and other purposes on Osmaston Park road; £3,500 for the improvement of the Wardwick, and £1,057 for the extension of the fire station.

Ballymena U.D.C.—£7,000 for the extension of the water works.

York T.C.—£30,681 for tramways, and £5,530 for [illegible] purposes.

FORTHCOMING INQUIRIES.

JUNE.	£
7. **Walthamstow.** For the purchase of land for a depot (Mr. F. H. Fallaize)	1,300
8.—**Bradford.** For the reconstruction of [illegible] (Mr. A. C. Dray)	2,377
8.—**Sheerness.** For the enlargement of the refuse destructor (Mr. P. M. Cresthwaite)	5,000
8. **Sunderland.** For the purposes of a housing scheme (Mr. H. A. Chapman)	22,260
9.—**Stockport.** For the purposes of the gas undertaking (Mr. R. H. Bicknell) ...	14,023
10. **Peterefield.** For works of water supply (Mr. P. M. Cresthwaite)	840

Municipal Work in Progress and Projected.

The Editor invites the co-operation of SURVEYORS and others with a view to making this record as complete and accurate as possible.

The following are among the more important proposed works of a public character appearing in Building Bye-laws, Plans, Maps, Specifications, and town planning Bills, Local Legislation, Water and road materials, Engineering, Contract Notices, St. Austell, Twickenham; sewerage and sewage disposal—Cricklade, Dorchester, Farnham, Gosport, Thame, water, general—Barnstaple, Dewsbury, Glasgow, Upton-on-Severn.—Particulars of other projected works will be found on our "Local Government Board Inquiries" page.

ADMINISTRATION.

Kent C.C. A recommendation by a joint committee has been adopted transferring the supervision of the county bridges and the execution of improvements and repairs in connection therewith from the county architect (Mr. F. W. Ruck) to the county surveyor (Mr. H. T. Chapman). Mr. Ruck, who, up to the year 1880, had held the office of county surveyor, [illegible] cover and include all necessary clerical and office expenses. His present salary is £600.

BUILDINGS.

Bexhill T.C.—The council have agreed to proceed with the drainage works and the erection of the observation block in connection with the new hospital scheme, at an estimated cost of £1,377.

East Preston R.D.C.—The surveyor, Mr. C. W. Leney, has received instructions to prepare an estimate and report on the repair of a three-span brick bridge at Ferring-road, Clymping, which had been [illegible]

Glasgow T.C. A recommendation made by the Health Committee to convert the Ibrox tramway depot into a temporary hospital for the treatment of phthisis [illegible] £5,000.

Middlesex C.C.—Mr. H. C. Crothall has received instructions to prepare the necessary plans for the proposed new assistant Hospital, and to carry out the further duties in connection with the erection of the asylum as the Visiting Committee may from time to time direct.—The Local Government Board have written assenting to a loan for the purchase of the site of the sanatorium in Essex. With regard to the erection of the building, the Public Works Loan Board wrote that the application of the council for loans for building could not be entertained unless evidence could be produced of Treasury or Local Government Board approval granted since the new conditions had been imposed.

Renfrewshire C.C.—The removal of the Upper Renfrewshire Fire Brigade from Pollokshaws to new headquarters at Darnley took place recently. Accommodation is provided for two motor engines and eight men, though one motor and six men will be sufficient until the district further develops. The cost of the buildings, which were designed by Mr. Robert Ewan, senr., architect, is £5,500.

Tipton U.D.C.—It was resolved on Tuesday last to proceed with a scheme for reconstructing four of the old retorts at the gasworks, which, it was stated, would represent an increased output of 30,000 cub. ft. per day, and would enable the works to cope with the demands from the Rowley Regis district and the growing needs of the parish. A larger scheme of extension suggested by the manager of the works (Mr. Prince) was postponed [illegible] it would entail, until after the war.

Uxbridge U.D.C. The surveyor, Mr. W. L. Eves, has received instructions to prepare plans for a public convenience.

York T.C. The Health Committee recommend the council to proceed with a scheme for the [illegible] of the fever hospital.

HOUSING AND TOWN PLANNING.

Blofield R.D.C.—The Local Government Board have sanctioned a loan of £70 for the purchase of land and legal expenses in connection with a housing scheme. The erection of the houses is, however, postponed.

Bristol T.C.—The Health Committee have authorised the Housing Sub-Committee to prepare a housing scheme.

Kingsbridge R.D.C.—The Local Government Board have again written respecting rural housing, asking to be more definitely informed what action was being taken by the council. The sanitary surveyor, Mr. W. H. Whitaker, reported that the inspection would be completed shortly. There were only one or two cases of overcrowding. The medical officer of health said the Local Government Board's own inspector, who had visited the district, had complained that a large percentage of the cottages were not right. They were wet—wring ng wet. They were built the wrong way, and could not be put right. Mr. W. H. Fairweather: Plenty of the farmhouses are also wet in damp weather. Dr. Webb: And so is my surgery. But when we told the inspector that the cause was due to the use of sea sand in the mortar, he would not have it. It was decided to reply that the council were not at the present time prepared to formulate a scheme, but that the house-to-house inspection was being expedited.

Longbenton U.D.C.—Authority has been received from the Local Government Board for the prepara- [illegible]

Pershore R.D.C.—At the council meeting on Tuesday a letter was read from the Local Government Board referring to the report of their inspector in connection with the contemplated housing schemes in the parishes of Wyre, Fladbury, and Peopleton. The board suggested that the council should proceed at once to prepare a scheme for eight houses (each containing three bedrooms) at Fladbury, and submit it to the board with an application for sanction for the loan required. When a satisfactory scheme had been settled the board would consider whether circumstances enabled them to sanction a loan for its immediate execution. The letter was ordered to "lie on the table."

Wantage R.D.C.—Instructions have been given to the surveyor to prepare a housing scheme for the district of East Hendred.

REFUSE COLLECTION AND DISPOSAL.

Sutton (Surrey) U.D.C. The provision of a refuse destructor is being considered by the Sanitary Committee.

ROADS AND MATERIALS.

Brighouse T.C.—It has been agreed to construct a new 40-ft. road parallel to Crowtrees-lane, and provide an ornamental plantation between the two roads.

Coventry T.C.—Consideration is being given to schemes for the improvement of Holbrook-lane, Foleshill-road, Waverley-road, and Holyhead-road.

Doncaster R.D.C.—A letter has been received from Mr. Dunston, county councillor, stating that he was glad to be able to inform the council that he had been instrumental first on the Highway Committee and next in the county council in getting a resolution passed declaring the Great North road, from the Doncaster borough boundary to Bawtry, to be a main road under the Locomotive Act, 1878, and he wished to express his thanks to the clerk and the surveyor (Mr. W. R. Crabtree) for the assistance given to him.

Hackney B.C.—The council have approved a scheme for a considerable widening on the eastern side of Kingsland-road, between Dalston-lane and Forest-road. The necessary land is to be given by the governors of St. Bartholomew's Hospital, with the consent of the Charity Commissioners.

Hampshire C.C.—For the coming year it is estimated that main roads will cost £94,639, or a decrease of £26,810, chiefly due to the postponement of wood block paving at Cosham. The sum left for road maintenance will be £81,822, against £81,813 last year. The expenditure on the old urban district roads is estimated at £20,501, or an increase of £2,237. The estimates include £27,000 to be spent on making good the roads damaged by military traffic, which sum is expected to be paid by the military authorities. An application is to be made to the Road Board for a grant towards surface road improvements.

Lymington R.D.C.—A letter has been received from the War Department through the Road Board agreeing to meet the council with respect to the cost of certain road improvements for military purposes.

Mansfield T.C.—The Local Government Board have intimated that they would offer no objection to the arrangement proposed for the acquisition by the council of property in Albert-street for street improvement—viz., that the property should be surrendered to the corporation, and that the owner should lend £1,000 to the corporation at £4 10s. per cent. This arrangement has been confirmed.

St. Austell U.D.C.—It is proposed to carry out an improvement in High Cross-street, at an estimated cost of £1,200.

Shepshed U.D.C.—The question of improvements to a number of footpaths has been referred to the surveyor, Mr. J. G. Foston, for report.

Southgate U.D.C.—It is proposed to effect improvements at Chase Side, and the corner of Green-lanes and Hedge-lane.

Sunderland T.C.—An improvement scheme is to be carried out at the corner of Dock-street East, and a new road constructed from Spring Garden-lane into Church-street.

Ticehurst R.D.C.—With regard to the advisability of allowing any of the roadmen off for haymaking and harvesting, the Highways Committee reported that the council had seventeen men working. Each man had about 6 miles of road on an average to look after, and the surveyor considered that this was quite as much as any man could fairly manage. The county council men, he was told, had only 2 miles each to look after. They had contracted to take 6,000 gallons of tar, which the surveyor had thought would cover about 3 miles, and if he kept the men and did not let any of them off he would be able to get the tarring done. The committee were of opinion that the tar was an advantage to the rates as well as to the roads, and they thought it would be better to continue tarring and keep the men on the roads. As regarded the question of wages, the committee understood the county council men had had the wages of their men raised 2s., and they recommended a similar increase to the rural council's workmen. This the council agreed to, the other recommendations contained in the report being also approved.

Twickenham U.D.C.—The surveyor, Mr. F. W. Pearce, has received instructions to proceed with the scheme for widening and improving Duck's-walk, the estimated cost of which is £250.

Uxbridge R.D.C.—Negotiations are proceeding with the Road Board with regard to road improvements in Northolt for military purposes.

West Lancashire R.D.C.—The county council have sanctioned a contribution of £100 towards the cost, estimated at £312, of the reconstruction of a length of road at Melling Point.

Wilts C.C.—The total cost of the main roads which the War Office requires to be repaired now amounts to £62,000. In regard to the council's own repairs they have tried to arrange that the expenditure should not exceed that of last year. Owing to the increased cost of living the sum of £500 has been set aside to meet additional wages of the roadmen, so that the actual expenditure will exceed that of last year by that amount.

SEWERAGE AND SEWAGE DISPOSAL.

Cricklade and Wootton Bassett R.D.C. The proposed sewage disposal scheme for Wootton Bassett, which is estimated to cost £3,350, has been referred back to the parish council for reconsideration and report.

Doncaster R.D.C.—It has been agreed to take up a loan of £1,063 for works of sewerage and sewage disposal.

Farnborough R.D.C.—It is proposed to carry out a drainage scheme for the parish of Radway.

Hursley R.D.C.—The Local Government Board have sanctioned the purchase of land at Chandler's Ford by the council for sewage outfall works.

Rugby R.D.C.—Sewage disposal schemes for Clifton and Newbold-on-Avon are under consideration.

Thorne R.D.C.—The question of a sewage scheme for Stainforth has been referred to a special committee for consideration.

WATER, GAS, AND ELECTRICITY.

Basingstoke T.C.—Loans amounting to £6,300 are to be taken up for extensions to the electricity system.

Birmingham T.C.—The council on Tuesday passed a resolution increasing the price of gas by 3d. per 1,000 cub. ft., to take effect from the June reading of the meters, and also a slight variation in the quantity of gas supplied through prepayment meters. The reason the council felt impelled to make the increase was mainly the large increase in the cost of gas coal and gas oil, and an advance in the wages of the workmen. Another contributing factor was the decline in the market for residuals, and further causes were the increases in the income-tax and the local assessment. —The nett balance of the electricity undertaking was £60,383, of which it is proposed to pay £35,385 to the credit of the rates, the largest sum thus paid in the history of the undertaking.

Bosmere and Claydon R.D.C.—It was reported that Mr. Child, a water diviner, had prospected for water at Barking Tye, Creeting Bottoms and Middlewood Green, and marked with stakes the points at which water might be found. The council decided that information as to the prospecting and particulars as to obtaining water supplies should be communicated to the parish councils of the respective parishes, and they should be requested to state their views on water supplies being provided by means of wells constructed at the points recommended by Mr. Child.

Burnham (Somerset) U.D.C.—The council have approved the scheme of the surveyor, Mr. W. H. Chowins, for an improved water supply. It is proposed to provide an iron main and a larger reservoir at an estimated cost of £4,000.

Cardiff T.C.—It is announced that the Waterworks Committee have temporarily suspended the following works: Outlet from Lisvane reservoir, Lisvane to Heath, loan sanctioned £13,443, and Heath extensions service reservoir £17,046.

Coventry T.C.—The available surplus of the gas undertaking for the last financial year was £5,084. It was recommended that this amount be carried forward. It was pointed out that there was a decrease in the profit of over £12,000, due to the reduced value of residuals and loss of revenue owing to the price of gas having been reduced a year ago by 2d. per 1,000 to users of slot meters. There had been an increased consumption of gas, and slot-meter consumers took one-third of the whole output. The great increase in the price of coal would be felt severely during the next two or three years.

Derby T.C.—In consequence of the large increase in the price of coal, the Electric Lighting Committee recommend that 10 per cent be added to the present charges for electricity. They take this course in order to avoid a loss on the working of the undertaking, but they point out that the additional revenue will not wholly cover the higher expenditure.

Hereford T.C.—The council on Tuesday decided that, owing to the increased cost of coal and labour, the price of gas should be increased by 3d. per 1,000 cub. ft., commencing September next. Further, owing to the increased cost of production and decreased consumption, it was resolved to make an all-round increase of 10 per cent on present prices for electricity, except in cases where prices are fixed by contract.

Keynsham R.D.C.—Inquiries are being made of the Clutton Rural District Council if they are willing to grant a water supply, and on what terms.

Leicester T.C.—In view of the small profit on the last half-year's working and the large increase in the cost of coal, it has been decided to increase the price of gas by 4d. per 1,000 cub. ft. for all purposes. It is estimated that an additional £14,000 will have to be provided for.

Nuneaton T.C.—The question of taking over ninety-seven gas lamps from the gas company in streets where electric cables have been laid is under consideration.

Port Glasgow T.C.—The council are seeking powers by way of Provisional Order (unopposed) for the provision of new gasworks.

Salford T.C.—The council on Wednesday approved a resolution of the Electricity Committee recommending that the charges to all consumers of electricity for lighting and power should be increased by 7½ per cent as from July 1st.

Upton-on-Severn R.D.C.—The Upton Water Committee are pressing the council to complete the water supply scheme, at an estimated cost of £5,000.

West Bromwich T.C.—The nett profit of the gas undertaking for the year ended March 31st was £1,307. The electricity undertaking earned a nett profit of £877.

Willesden U.D.C.—The Electricity Committee recommend the council to obtain authority from the Local Government Board to raise part of the loan of £20,000 already sanctioned for the provision of mains and services.

MISCELLANEOUS.

Dundee T.C. The possibility of a municipal analine dye industry being established in Dundee in the near future was referred to recently after an inspection by members of the council of the tar distillation plant works at Fish Dock-road and the vertical retorts at the gasworks. Lord Provost Don stated that personally he was prepared to go a good deal further than he once was in the way of municipal enterprise. If the town council did not make the dyes they could certainly sell the products for making them.

Birmingham T.C.—At the council meeting on Tuesday, Mr. G. Cadbury junr., drew attention to the difference in the cost of running between trams and motor 'buses, and declared the latter were 50 per cent more costly than the trams. In addition they were a heavy strain upon the roads, and caused increased expense in that direction. The sooner the 'buses were taken off and replaced by trams the better he would be pleased. Mr. H. Barrow, chairman of the Tramways Committee, said he agreed generally with what had been said about the cost of running the 'buses, but he would like to point out that those on the Harborne route had only been running during the winter months so far as the council were concerned, and it was anticipated that the cost of running during the summer would be less. It had been proved that the 'buses were not suited for macadam roads.

Tipton U.D.C. A sum of £195 is to be borrowed at 4½ per cent interest for the purchase of a new motor fire engine.

Yeovil T.C.—The Horse Committee are considering the question of purchasing a steam lorry on the hire-purchase system. The Local Government Board have refused sanction to a loan.

INSTITUTION OF WATER ENGINEERS.

TWENTIETH SUMMER GENERAL MEETING.

The twentieth summer general meeting of the Institution of Water Engineers will be held at the apartments of the Geological Society of London, Burlington House, W. (kindly lent for that purpose by the president and council of that body), on Friday, June 18th, commencing at 3 p.m.

The following papers will be read and discussed:—

(1) "The Effect of Spring upon Water-levels in the Chalk of Eastern Surrey," by Henry Dewey, F.G.S. (H.M. Geological Survey).

(2) "The Hydrological Conditions of Newton's East Yorkshire," by Percy Griffith, M.INST.C.E., F.G.S.

PROGRAMME.

The chair will be taken by the retiring president (Mr. Thomas Molyneux), and the minutes of the nineteenth winter general meeting, held in London on December 11, 1914, will be read and put for confirmation.

The names of members, &c., elected since the last general meeting will be announced, and those present will be welcomed by the president.

Introduction of the new president (Mr. F. W. McCullough, M.INST.C.E., J.P.), and presentation of certificate of election.

Vote of thanks to retiring president.

The new president will present a short report upon the work of the institution during the past year.

Reading and discussion of papers.

Toads Alive in Solid Rock.—Two live toads were found recently in a solid piece of rock split by workmen digging trenches for sewage purposes at Cotwall, Staffordshire.

Glasgow Corporation Tramways.—It is estimated that the decrease in traffic receipts on the Glasgow Corporation tramways during the financial year which closed on May 31st will amount to about £8,000.

FOR OTHER ADVERTISEMENTS
See End of Paper.

FAREHAM URBAN DISTRICT COUNCIL.
Wanted, in the Office of the Surveyor and Sanitary Inspector, a Temporary Assistant. Salary £85 per annum. Applicant must not be of military age (unless medically unfit). Further information may be obtained upon application to the District Council Offices, Fareham.

Applications, in envelope marked "Assistant," must be delivered to the Surveyor not later than 10th June, 1915. (2,600)

PERSONAL.

Mr. P. M. Gannon, of Navan, has on Monday last appointed assistant county surveyor for the Navan district of Westmeath, at a salary of £100 per annum.

Mr. G. H. Webb, assistant to the surveyor to the Aldershot Urban District Council, having almost completed the supervision of the scheme of sewerage reconstruction, has obtained leave to join the colours, a councillor observing that he deserved every commendation for his patriotic spirit.

Mr. D. A. Pearson, highways surveyor to the Bicester Urban District Council, has had his salary increased by £20 per annum, and at the same time the council expressed their appreciation of his attention to duty, and of the efficiency in the several departments that come under his control.

Mr. John Henry Hanson, M.INST.C.E., senior partner in the firm of Messrs. Abbey & Hanson, land agents and valuers, of Huddersfield, has been elected president of the Surveyors' Institution in succession to Mr. H. Chatfield Clarke, and was installed in the chair at the annual general meeting on Monday evening.

Mr. Hugh Owen, who for nearly forty years was borough surveyor and rate collector of Flint, and for twenty-six years secretary and manager of the Flint [illegible] Water Company, died recently at his residence in Flint after a prolonged illness. He was seventy-five years of age, and a native of Coniston, but had resided in Flint nearly all his life.

Mr. A. B. M'Donald, city engineer of Glasgow, retired on Monday, after forty-five years' service with the municipality. On the death of Mr. John Carrick, in 1890, the offices of city engineer and master of works, both of which that gentleman had held, were separated, and in October of that year Mr. M'Donald was appointed city engineer. On Monday afternoon Mr. M'Donald was the recipient of a presentation in the form of two silver rose-bowls from the staff of the office of public works. Mr. Thomas Nisbet, master of works, who presided, said that Mr. M'Donald had given faithful service to the corporation. His duties had been extremely onerous. Glasgow had nearly doubled in area, population, and valuation since Mr. M'Donald became connected with the department, and everything for which Mr. M'Donald was responsible had been efficiently done. Mr. M'Donald, in acknowledging, said that during his tenure of office the department had carried out very important and often very difficult public work, the cost of which to the citizens of Glasgow had amounted to £4,219,000.

Mr. A. Rothera, M.I.M. AND CO.E., engineer and surveyor to the Liversedge Urban District Council, has been appointed to the position of engineer and surveyor to the newly constituted urban district of Spenborough, which is an amalgamation of the urban districts of Cleckheaton, Gomersal and Liversedge. Mr. Rothera has been surveyor at Liversedge for the past 4½ years. The new council is the largest in Yorkshire, and has a population of 31,323 (1911), an acreage of 4,983, and a rateable value of about £140,000. There are about 36 miles of main and other roads. The new district possesses seven sewage works, at [illegible] which the sewage from the major part of the three amalgamated districts has been treated for some years, and where daily, in dry weather, about 1,250,000 gallons of sewage is purified. Other possessions are two town halls, two cemeteries, two central depots, park and recreation ground, electricity station, two destructors, secondary and technical school, mortuary, public baths, fire station, water mains and gasworks, together with interests in three infectious diseases hospitals. The district is well sewered, possesses a variety of manufactories, is in the centre of the Spen Valley, is a Parliamentary centre, and there is an abundance of building land in the most healthful part of the district ready to develop on garden city lines. The district of Liversedge and the neighbourhood is the scene of some of the novels written by Charlotte Brontë—particularly "Shirley"—and the family used to reside there during the Rev. Patrick Brontë's vicariate at Hartshead.

The Safety of Reservoirs.—The Metropolitan Water Board have decided that during the war it was inadvisable to let, as has been the practice, the surface of covered reservoirs to lawn tennis and other sports clubs. It is thought undesirable that anybody except the members of the board and the staff should at the present time have access to the works.

Institution of Municipal Engineers.

A VISIT TO DUNSTABLE.

Members of the Eastern, North-Eastern and South-Eastern Districts of the Institution of Municipal Engineers paid a visit of inspection to the ancient borough of Dunstable on Saturday, and undertook a tour of the town and neighbourhood. Members and their friends met at the town hall at 1.30 p.m., and were cordially welcomed by the mayor (Councillor F. T. Garrett), who was accompanied by the town clerk (Mr. C. C. S. Benning). There were also present: Messrs. W. Matthews Jones (president of the institution), Harold Pickering (Luton), F. R. Chapman (Bedford), J. C. Nicholls (Newport Pagnell), E. J. Saunders (Leighton Buzzard), E. Pollard (Leighton Buzzard), W. Mann (Dunstable), G. Simcox (South Mimms), R. Tear (Luton), W. F. Wilkins (Dunstable), L. Foster (Ampthill), T. G. Mustafa (London), T. E. Dodds (London); Councillors B. Hartop (chairman, Luton Rural District Council) and E. G. Blow (Luton Rural District Council); G. Belson Chilvers (hon. secretary, Eastern and North-Eastern Districts of the institution), and B. Wyand (secretary of the institution).

The Mayor said he had the greatest pleasure in bidding the members a most hearty welcome to the old town of Dunstable. They were meeting in a town with many historical associations. Not only was it situated at the intersection of those old Roman roads the Watling-street and the Icknield Way, but it was a town with a very old franchise. If not the oldest, it was certainly one of the oldest municipalities in the country, its first Charter being granted to a Company of Priors by Henry I. in about 1100. The town's history went back far beyond anything in the nature of municipal authorities or institutions. In the immediate neighbourhood evidences were constantly arising that primæval men and beasts existed on the hills many centuries before the Christian era. Traces were frequently found of their skill in making stone implements and weapons, and there was no doubt that men existed there soon after the glacial period and the disappearance of the icebergs. The old church was of sufficient interest to occupy a single afternoon, while on the Downs they had the remains of the huts or cave dwellings of the ancient Britons. He could place before them accounts of many discoveries at the old Brito-Roman encampment at Maiden Bower, which they were visiting, and which had never been thoroughly investigated. If excavations could be made at the Maiden Bower and its vicinity he was sure some interesting relics of the past ages would be found there.

The President briefly thanked the mayor for his welcome, and the party then commenced their tour in motor cars.

DUNSTABLE SEWAGE WORKS.

A visit was first paid to the corporation sewage farm, about 1½ miles from the northern end of the town, the visitors being shown round by Mr. W. F. Wilkins, the borough surveyor, who explained the details of the works in a short paper.

The farm is situated about 1½ miles from the northern end of the town and in the Luton rural district, the whole of the sewage being conveyed by gravitation. The borough outfall sewer is laid along the main road, known as Watling-street. The total area of the farm is 45 acres, the greater portion of the subsoil being clay, chalk being found at the southern end, where the filters and tanks are situated. There is an average of from 12 to 14 in. of top soil.

On reaching the farm the sewage passes through screening chambers, detritus tanks and sedimentation tanks. From these the partially purified liquid is discharged on to filters by means of floating arms and a dosing chamber, through a large humus tank, and then finally by an earthen grip and 6-in. pipes to the brook. After this treatment excellent samples are obtained. In heavy storms the excess water overflows to a storm-water chamber and then passes by a main carrier to a storm-water bed and over grass land. The storm-water tank is formed with soil, but, nevertheless, good results are obtained.

The present plant was put down in 1910-11, at a cost of £6,250, the engineers being Messrs. J. Diggle & Son, of Westminster, and is designed to deal with a population of 20,000. The then existing detritus tanks were incorporated into the scheme, of which the following are brief particulars: Screening Chambers: These are in duplicate and provided with ½-in. screens. Detritus Tanks: These are 19 ft. by 15 ft. Sedimentation Tanks: There are two tanks, each 51 ft. long by 31 ft. wide, with a depth varying from 5 ft. 6 in. to 6 ft. 6 in., each capable of holding about one-third of a day's flow. Dosing Chamber: This is fitted with a Stone's syphon, which discharges the effluent on to the filters by separate pipes controlled by valves. Filters: There are four filters, each 60-ft. diameter by 9 ft. in depth, fitted with Ames-Crosta revolving sprinklers. The filtering media consists of 12 in. of 6-in., 2 ft. of 3-in., and the remainder of 1-in. gas clinker, each filter being enclosed in pigeon-holed walls, 9 ft. in height. Two radiating rows of 4-in. perforated pipes are laid in each filter for better aëration. From a first observation on the ground it might be thought that the sewage passes over the top filters first and then on to the lower ones. This is, however, not the case, each filter being used separately.

The average area of ground used for irrigation at one time is about 8 acres, the remainder being farmed. The crops grown average about 9 acres each of oats and wheat, 4 acres each of clover and mangolds, and 4½ acres of beans, with about 12 acres of grass used for hay and cattle feeding, with occasional irriga-

Totternhoe Cottages, Luton.

tion. From six to ten head of cattle are fed and fattened for sale annually. The whole of the land is underdrained.

The area served by the farm is the borough of Dunstable, 892 acres and 8,057 population, and part of the parish of Houghton Regis, 205 acres and 1,242 population; a total of 1,097 acres and 9,299 population. The dry-weather flow is estimated at about 200,000 gallons.

Returning to the gasworks, the party were met by Mr. G. F. Cutting, manager to the Gas and Water Company, and under his guidance made an inspection of the undertaking.

The Stone Age camp of Maiden Bower, a short distance across the fields, was next visited, and the five original entrances through the ramparts which still remain were pointed out. The camp has an area of over 10 acres, and was originally surrounded by a deep ditch. Here it is that remains of Neolithic man and of the Bronze Age have been discovered. Being met by the motor cars in the Green Way, an ancient British road, and the precursor of the Roman road which passes through Dunstable, the party were driven to the Totternhoe Knolls, from the top of which a magnificent view of the surrounding country was obtained. The huge knoll is an ancient British look-out position and fine beacon, and the depression made for the furnace on the top is clearly visible. The hill is 524 ft. above sea level.

LUTON RURAL COUNCIL'S COTTAGES.

Passing through Totternhoe, a halt was made to inspect four cottages recently built by the Luton Rural District Council from plans prepared by their surveyor, Mr. H. Pickering.

The visitors were very favourably impressed by the appearance and accommodation of these cottages, and the price at which they were erected. They are built of [illegible]

given free by Earl Brownlow. The site is pleasing and very suitable on rising ground at foot of hill (chalk), with south-western aspect and sheltered from northerly and easterly winds by the hill. Externally walls are 9 in. brickwork, concreted and pebble-dashed, with hand-made tiles. Each cottage has a living-room, kitchen, and one scullery downstairs, and three bedrooms upstairs. The dimensions of the rooms are as follows: Living room, 13ft. 6in. by 11ft. 6in.; scullery, 14ft. by 9ft. 3in.; bedroom (1) 11ft. by 9ft. 3in., (2) 11 ft. 6 in. by 8 ft. 3 in., (3) 8 ft. 9 in. by 8 ft. 3 in.; also to each cottage pail closet and coal store, of similar materials as cottages, but detached.

The [illegible] cost of cottages, including [illegible] water supply and [illegible] was £[illegible] or £[illegible] per 1649 all the buildings (including [illegible] £[illegible]

could not possibly attempt to build on those lines at Chester. He had also been very much interested in the old Roman camps they visited, which anyone interested in history would agree were well worth seeing. Members of the Institution of Municipal Engineers [illegible] had on that occasion, but their pleasure had been [illegible] They liked to go to various towns and pick up knowledge from other people, and [illegible] a good deal that day.

The Mayor assured Mr. Jones that it gave the Mayoress and himself much pleasure to entertain them, and he hoped that would not be the last occasion on which they would visit Dunstable.

Mr. B. Hartop, chairman of the Luton Rural District Council, thanked Mr. Jones for his remarks about the Totternhoe cottages, and said that, although the

of water supply (draw well sunk 50 ft. into chalk) and fencing, £19. The cottages are let at weekly rental of 3s. 7d. (rates inclusive).

The waterworks at Dunstable were also visited, and the company were enabled to see the recently installed engine at work, this pumping 30,000 gallons per hour.

Arriving back at the town hall, they were entertained to tea by the Mayoress, to whom the president afterwards voiced the thanks of the company. He also thanked the Mayor and Messrs. Wilkins and Pickering for a most enjoyable afternoon. They had not only had the pleasure of seeing the beautiful scenery and town of Dunstable, but also some extremely interesting works. Alluding to the cottages they had inspected at Totternhoe, the president said he believed these were the cheapest he had seen built in this country, and when they remembered the pleasant situation and the amount of land attached to them he could hardly understand how it had been found possible to let them at 3s. 7d. per week. They council had the land given free, they were much indebted to their surveyor (Mr. Pickering) for the able manner in which he carried out the scheme. Without wishing to flatter those present, he could say that the general public little knew how much they were indebted to surveyors. Public officials were usually looked upon as gentlemen who did nothing but ask for an increase of salary; but those who happened to be behind the scenes, and knew a little about matters connected with the health of the community, were aware of the enormous amount of work surveyors had to perform. In this most of them were sincere, and did their best without thought of reward.

Messrs. Pickering and Wilkins also suitably replied.

Coast Sand Dunes (By Gerald O. Case, St. Bride's Press, Limited, 24 Bride-lane, E.C., price 5s.).—Mr. Case has done a valuable work in the writing of this book.—*Southport Guardian.*

FLIES AND DISEASE.

Reference has been made recently in these pages to the risk of the transmission of disease by flies, and all those who are acquainted with the subject are agreed that the most efficient remedy is to stop the breeding of the fly, preventing the accumulation of filth and refuse. Much time will elapse before the public as a whole can be made to realise the importance of the means of protection from disease, but meanwhile those who recognise their duty and pay more than lip service to the maxim that cleanliness is next to godliness may often save their neighbours as well as themselves from much suffering.

Under these circumstances it is important to have some means of preventing flies from entering houses and settling on food, not only in ordinary houses, but particularly in hospitals, camps, and the many buildings in which numbers of persons, infirm, ailing and war prisoners are housed.

For this purpose the use of Heppell's anti-fly spray appears to be a most efficient method. It is a non-poisonous solution of chemical and vegetable insecticides combined in an agreeable form, and is supplied in small bottles each provided with a powerful spray, which enables the user to reach and penetrate corners and crevices, and to catch the flies either resting or in flight. It should be used freely round window-frames and doors; carpets should be sprinkled with the spray, and walls washed with a solution of three cupfuls to each bucket of water.

Gauze or curtains saturated with the anti-fly spray should be hung over larder windows and doors, and saucers containing the solution, with the addition of a lump of sugar, may be put about in places where the flies are particularly troublesome without any risk to domestic pets. In all cases where the flies are particularly prolific the dustbin, which is a favourite breeding-place, should be saturated with the spray, with the addition of a large handful of borax.

The solution has been tested and approved in restaurants, hotels and riverside resorts, and when required for large areas it can be obtained in a concentrated form for dilution and use with a larger sprayer.

The anti-fly spray can be obtained from Heppell & Co., pharmacists, &c., 73 Knightsbridge, S.W., or any of their branches, in two sizes, at 3s. 6d. and 5s. 6d., and special quotations would be given for the requirements of local authorities, hospitals, camps, sanatoria, and other institutions.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

ANNUAL GENERAL MEETING.

The forty-second annual general meeting of the Institution will be held at the Institution of Civil Engineers, Great George-street, Westminster, on Thursday and Friday, June 24th and 25th, followed by visits on Saturday, June 26th.

PROGRAMME.

Thursday, June 24th.

9.30 a.m.—Meeting of subscribers to the Orphan Fund.

10 a.m.—Council meeting.

10.30 a.m.—Members will assemble in meeting room and will be welcomed by Mr. County Alderman W. Regester, J.P. (chairman, Middlesex County Council).

ANNUAL GENERAL MEETING.

Chairman: The outgoing president, Mr. J. S. Pickering, M.Inst.C.E..

Minutes of last annual general meeting.
Annual report of the council (to be taken as read).
Presentation of premiums.
Election of auditors and scrutineers.
Installation of Mr. H. T. Wakelam, M.Inst.C.E., as president.
Presidential address.

Chairman: Mr. H. T. Wakelam, M.Inst.C.E. (President).

12 noon.—Address on Town Planning by Mr. Raymond Unwin, Chief Town Planning Assistant, Local Government Board).

1 p.m.—Adjournment for lunch.

2 p.m. Discussion on the following papers (to be taken as read):

(1) "Mechanical Traction for Municipal Work," by E. J. Elford, M.Inst.C.E., borough surveyor, Southend-on-Sea.

(2) "Haulage by Mechanical Means," by T. W. E. Higgens, Assoc.M.Inst.C.E., borough engineer, Chelsea.

(3) "The Use of Motor Vehicles in Haulage of Materials on the Highway," by F. W. Smart, chief engineering assistant, Bedfordshire.

(4) "Notes on Sewage Treatment by Forced Aëration," by J. P. Wakeford, M.Inst.C.E., city surveyor, Wakefield.

(5) "Some Recent Experiences in the Surfacing and Maintenance of Roads, particularly on a Clay Subsoil," by J. A. Webb, engineer and surveyor, Hendon Rural District Council.

(6) "Resurfacing Roadways with Tarmacadam," by N. Greenshields, Assoc.M.Inst.C.E., borough engineer, Bedford.

(7) "The New British Sewage, Drainage and Drainage Ventilation Systems of the Twentieth Century," by I. Shone, C.E.

(8) "The Reinstatement of Trenches," by Reginald Brown, M.Inst.C.E., surveyor to the Southall-Norwood Urban District Council.

4 p.m. Afternoon tea (by kind invitation of the president, Mr. H. T. Wakelam).

Friday, June 25th.

10 a.m.—Discussions on the following papers (to be taken as read):

(9) "The Improvement and Maintenance of Highways in connection with Modern Traffic Conditions," by C. F. Gettings, M.Inst.C.E., county surveyor, Worcestershire.

(10) "Improvement and Maintenance of Highways," by J. S. Brodie, M.Inst.C.E., borough engineer, Blackpool.

(11) "Reinforced Concrete for Roads, Sewerage, &c.," by A. E. Collins, M.Inst.C.E., city engineer, Norwich.

(12) "Tar, Pitch and Bitumen in Road Construction," by A. Dryland, M.Inst.C.E., county surveyor, Surrey.

(13) "Fire Brigade Organisation and Equipment," by W. A. Farnham, engineer and surveyor, Foots Cray Urban District Council.

(14) "Protection of Ancient Buildings," by W. A. Forsyth, F.R.I.B.A.

1 p.m.—Adjournment for lunch.

2 p.m.—Discussion continued.

4 p.m.—Opening of Road Exhibition, Horticultural Hall, Vincent-square, S.W.

6.45 p.m.—Reception in the Oak Room of the Hotel Cecil by the president.

7.15 p.m.—Annual dinner in the Victoria Hall, Hotel Cecil. (Tickets 7s. 6d. each, exclusive of wine.)

Saturday, June 26th

VISITS.

VISIT A.—Kingston Sewage Disposal Works and Canbury Gardens.

9 a.m.—Assemble at Westminster Bridge Pier, and proceed by launch "King" (tickets 3s. 6d. each) to Karsino Hotel, Hampton Court.

1.15 p.m.—Lunch at Karsino (by kind invitation of the president, Mr. H. T. Wakelam).

2.0 p.m. Launch leaves the Karsino Hotel for Kingston.

3.30 p.m. Disembark at Kingston, and visit sewage works and Canbury Gardens.

5 p.m.—Return by train to London.

VISIT B.—Southwark Bridge Reconstruction.

10 a.m.—Assemble at City end of Southwark Bridge.

The work comprises the removal of the old Southwark Bridge, and the erection on the same site of a new bridge with improved gradients. The old Southwark Bridge consisted of three cast-iron arches, the largest span being 240 ft. The bridge was designed by Rennie, and was opened to public traffic in 1819. The Corporation of London decided upon its removal on account of the steepness of its gradients, 1 in 18 on the City

... and the abutments piers were out of alignment with the other bridges in the district. The new bridge consists of five steel arches and the contract price is nearly £12,000. At the present stage the old bridge has been entirely removed, and the foundations for the new piers are in hand. Each of the new piers will be of stone, and will be founded on caissons sunk into the bed of the river. The caissons will be sunk under compressed air, and as they sink the piers will ... will be constructed with seven ribs, and upon these the steel flooring supporting the roadway and footpaths will be laid. The width between parapets will be 55 ft., the roadway being 35 ft. in width and the footpaths [illegible] The bridge will be 42 ft. 6 in. wide.

VISIT OF NEW UNDERGROUND TUBE FROM GENERAL POST OFFICE TO PADDINGTON.

... assembled at the operating centre, No. 16A South Wharf-road, adjoining the Grand Junction Canal, at Paddington. Represented at Mr. Balfour's Party [illegible] been appointed by the Postmaster-General to inspect the mechanical equipment of the railway [illegible] works.

Ladies are not invited to attend the meeting, owing to the general dangers ...

SOUTHALL MEETING.

A meeting of the London District will be held in the Town Hall, Southall, to-morrow (Saturday).

J. A. WEBB,
Hon. District Secretary.

Great Stanmore.

AYR MEETING.

The annual Scottish District meeting of the institution will be held at Ayr [illegible] and [illegible]

DAVID A. DONALD,
Hon. District Secretary.

Great [illegible]

MATLOCK MEETING.

The arrangements for the institution meeting to be held at Matlock on June 12th include visits to the new sewage works, the brine and electric baths, and other undertakings.

J. W. DUDLEY ROBINSON,
Secretary.

INSTITUTION OF MUNICIPAL ENGINEERS.

COUNCIL MEETING.

At a meeting of the council held in London on May 26th the following applicants were recommended for admission:—

To Membership: Messrs. B. G. Michel, municipal engineer, Carleton-place, Ontario, and S. H. Davies, Wirral Urban District Council.

To Associate membership: Mr. F. C. Noble, surveyor, Chichester.

Transferred to Membership: Messrs. E. G. Stimson, city surveyor's office, Sydney, and S. L. Kumar, irrigation engineer, Bannu, India.

New Members, &c.—From the applicants recommended for admission at the last meeting two members and one associate-member were elected.

Mutual Aid and Defence Fund.—A committee, consisting of Messrs. F. S. Cutler, Winter Gray, T. Mundy and John Taylor, was appointed to consider the question of the administration of this fund.

National Road Conference and Exhibition.—Messrs. Horace Boot, E. A. Stickland, T. Mundy, F. S. Cutler, H. J. Farmer and W. Finch were nominated to represent the institution at this conference, which is to be held June 25th to July 1st. An informal meeting of the institution will be held at the council offices on June 30th, at 4 o'clock, and members are invited to attend and visit the exhibition afterwards.

Nominations for ordinary members of council must be deposited with the secretary by June 20th, and forms for the purpose may be obtained on application.

The next meeting of the council will be held in London on Wednesday, June 30th, at 5.30 p.m., during the week of the National Road Conference. The July ... meeting will be held at Newcastle-on-Tyne.

Members who have not paid the current year's sub... possible.

B. WYATT,
Secretary.
39 Victoria-street.

ASSOCIATION OF MANAGERS OF SEWAGE DISPOSAL WORKS.

MANCHESTER MEETING.

By the kind permission of the Manchester Corporation, a visit to their sewage disposal works at Davyhulme (Urmston) has been arranged for Saturday, June 5th, at 3 p.m.

The works are about 1 mile from Urmston Station.

ROYAL SANITARY INSTITUTE.

BRISTOL MEETING.

A ... meeting ... the Council ... Bristol, on Friday, June 11th, in the Civil Court, Guildhall, Bristol, when a discussion, to be opened by Lieutenant-Colonel D. S. Davies, medical officer of health, Bristol, and Mr. L. S. Mackenzie, ASSOC.M.INST.C.E., city engineer, Bristol, will take place on "The Co-ordination of Military and Civil Sanitary Services in War Time."

The chair will be taken at 11 a.m. by Lieutenant-Colonel H. R. Kenwood, M.B., D.P.H.

1.15 p.m.—Luncheon at Stuckey's Restaurant, Wine-street, Bristol. (2s. 6d. each.)

2.30 p.m.—Proceed by motor char-à-banc from top of ... Bath new sewage works, and to Twerton to inspect the pumping station. The party will be conducted over the works by Mr. W. H. ... (Tickets for motor, 2s. 3d.)

5.15 p.m. Tea at the Old Red House, New Bond-street, Bath. (Tickets for tea, 1s. 3d. each.)

6.15 p.m.—Motors leave Bath for Bristol.

Tickets for the admission of visitors may be had on application to Lieutenant-Colonel D. S. Davies, M.D., medical officer of health, Prince-street, Bristol, or of Mr. T. J. Moss-Flower, Carlton Chambers, 25 Baldwin-street, Bristol, who is acting as hon. local secretary of the meeting, and of Mr. E. White Wallis, secretary.

YEOVIL MEETING.

A ... meeting ... will be held at Yeovil, on Wednesday, June 9th, when a discussion on "Water Supplies to Rural and Small Urban Areas" will be opened by Dr. W. G. Savage, county medical officer ...

APPOINTMENTS VACANT.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, *but these responsible for their despatch are recommended to arrange that they reach* THE STEVENS *office by noon on* WEDNESDAYS *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

ENGINEERING ASSISTANTS.—June 7th.—Ilkley Urban District Council. £120 per annum.—The Engineer and Surveyor.

ROAD FOREMAN.—June 7th.—Brighouse Town Council. 45s. per week.—Borough Engineer.

REFUSE DESTRUCTOR SUPERINTENDENT.—June 7th.—Corporation of Coventry. £3 5s. per week.—Mr. J. E. Swindlehurst, city engineer and surveyor.

SURVEYOR AND WATER ENGINEER.—June 8th.—Bridgwater Rural District Council. £250—£325.—Mr. T. M. Read, clerk, Rural District Council Offices, Bridgwater.

CLERK OF WORKS.—June 8th.—Llantrisant and Llantwit Fardre Rural District Council. £3 3s. per week.—Mr. W. Spickett, clerk, Pontypridd.

WORKING WATERWORKS FOREMAN.—June 8th. ... Urban District Council. 30s.–40s. per week.—Mr. James A. Hutchinson, waterworks engineer and manager, Town Hall.

BOROUGH ELECTRICAL ENGINEER.—June 9th.—West Hartlepool Town Council. £400 a year.—Mr. H. Simpson, town clerk.

INSPECTOR OF NUISANCES.—June 11th.—Spenborough Urban District Council. £150 a year.—Mr. John H. Linfield, clerk, Town Hall, Cleckheaton.

GAS ENGINEER.—June 12th.—Stoke-on-Trent Corporation. £500 £700 per annum. Mr. E. B. Sharpley, town clerk.

BOROUGH SURVEYOR.—June 12th. Corporation of Wenlock. £200 per annum. Mr. F. H. Potts, town clerk.

BOROUGH ENGINEER AND SURVEYOR.—June 14th.—Woolwich Borough Council. £500—£650.—Mr. Arthur B. Bryceson, town clerk.

INSPECTOR OF NUISANCES.—June 14th.—Colwyn Bay Urban District Council. £150 per annum.—Mr. J. Amphlett, clerk.

DISTRICT SURVEYORS (2).—June 18th.—London County Council.—The Clerk, County Hall, Spring-gardens, S.W.

Buildings.

GRIMSBY. June 5th. For alterations to "Rutland House," for the rural district council.—Mr. J. F. Wintringham, St. Mary's Chambers, Grimsby.

SOMERSET.—June 5th.—For carrying out sea defence works at Blue Anchor, near Minehead, for the county council.—Mr. Edward Stead, county surveyor, Wells.

SHORTLANDS.—June 7th.—For the construction of a subway and other contingent works, for the Metropolitan Water Board.—Chief Engineer, Savoy-street, Strand, W.C.

DROMORE.—June 8th.—For the erection of twenty cottages, for the rural district council.—The Clerk.

LAMBETH.—June 8th.—For the execution of work in connection with the painting and cleaning of the infirmary, for the Board of Guardians.—Mr. James L. Goldspink, clerk, Board Room, Brook-street, Kennington, S.E.

WOODHALL SPA. June 9th. For reconstructing a culvert, for the urban district council.—Mr. J. E. Chatterton, clerk, 4 Church-lane, Horncastle.

WEST RIDING.—June 9th.—For the construction of four shelters, for the Asylums Board.—Mr. W. E. H. Burton, architect, West Riding Asylum, Wakefield.

WOOD GREEN.—June 9th.—For the erection of a covered rifle range, for the urban district council.—The Surveyor.

GLAMORGAN.—June 12th.—For repairs and alterations to schools, for the county council.—Mr. T. Mansel-Franklen, clerk, County Hall, Cardiff.

WEST SUFFOLK.—June 14th.—For repairs at certain schools, for the Education Committee.—Mr. A. A. Hunt, county architect, 51 Abbeygate-street, Bury St. Edmunds.

CREWE.—June 15th.—For the erection of three cottages, for the corporation.—Mr. G. Eaton-Shore, borough surveyor.

GREENOCK.—June 15th.—For the erection of 150 houses, for the corporation.—Office of Public Works, Municipal Buildings.

CASTLEBAR.—June 19th.—For building four cottages, for the rural district council.—The Clerk.

ALDERSHOT.—For the re-erection of a temporary hospital. Offers invited from owners of wood or iron buildings.—Mr. F. C. Uren, surveyor.

BOOTLE.—For alterations to school lavatories, for the corporation.—Borough Engineer.

Engineering: Iron and Steel.

ROTHWELL. June 4th. For the construction of stoneware and cast-iron pipe collecting drain, with junctions, manholes and washouts, for the urban district council.—Messrs. Everard, Son & Pick, 6 Millstone-lane, Leicester.

BALLYMENA.—June 5th.—For supplying and laying cast-iron water pipes, for the urban district council.—Messrs. Swiney & Croasdaile, engineers, Avenue Chambers, Belfast.

BRIDGNORTH.—June 7th.—For water main renewal, for the corporation.—Borough Surveyor.

MAYO.—June 7th.—For the reconstruction of Sonnagh Bridge, for the county council.—The Secretary, County Council, Castlebar.

FARNBOROUGH.—June 7th.—For the supply and erection of a standard type steam disinfector and machinery, horse-drawn ambulance, and the erection of corrugated-iron disinfection station, for the urban district council.—Mr. J. E. Hargreaves, engineer and surveyor.

ISLE OF WIGHT.—June 9th.—For repairs to a bridge, for the rural district council.—Mr. L. A. Cozens, surveyor, Walmer Villa, Castle-road, Newport, I.W.

CHORLEY.—June 11th.—For the supply and fixing of hydrants, for the rural district council.—Mr. A. Jolly, surveyor, High-street.

HALIFAX.—June 12th.—For the supply and fixing of a hot-water boiler, for the Education Committee.—Mr. J. Lord, borough engineer.

YORK.—June 14th.—For the construction of two 30-in. cast-iron pipe lines, for the corporation.—Mr. F. W. Spurr, city engineer, Guildhall.

DUBLIN.—June 15th.—For the supply and erection of four Lancashire boilers, for the Office of Public Works.—Mr. H. Williams, secretary

EAST STOW.—June 16th.—For the construction of a bored well, trial pumping, and other works, for the rural district council.—Messrs. J. Taylor & Sons, engineers, Caxton House, Westminster, S.W.

MADRAS.—July 14th.—For the supply of cast-iron pipes, special castings, sluice valves and hydrants, for the corporation.—Mr. J. W. Madeley, special engineer; agents, Messrs. James Mansergh & Sons, 5 Victoria-street, Westminster, London, S.W.

RANGOON.—August 11th.—For the installation of a system of fire alarms, for the municipality.—Messrs. Ogilvy, Gillanders & Co., 67 Cornhill, London, E.C.

Gas and Electricity.

KIRKCALDY. June 14th. For the supply of 100 half-watt, 1,000-c.p. lamps and lanterns, for the corporation.—Mr. O. F. Francis, burgh electrical engineer and tramways manager, Electricity Works, Kirkcaldy.

REDDITCH.—June 14th.—For the supply of high-tension three-phase switchboard, for the urban district council.—Messrs. Handcock & Dykes, engineers, 11 Victoria-street, Westminster, S.W.

WEST HAM.—June 14th.—For the installation of the electric light and low-pressure hot-water heating apparatus, for the Education Committee.—Mr. W. Jacques, architect, 2 Fen-street, Fenchurch-street, E.C.

STOURBRIDGE.—June 15th.—For the supply of an exhauster, for the Gas Committee.—Mr. C. H. Webb, engineer and manager, Gasworks.

EDINBURGH.—June 21st.—For the supply of two 5,000-kw. turbo-alternators and condensing plant, for the corporation.—The Engineer, Dewar-place, Edinburgh.

Roads.

NEW SHOREHAM.—June 5th.—For the supply of 400 yds. of surface hand-picked land flints, or, alternatively, 400 yds. of dug pit flints, for the Harbour Trustees.—Chairman, Works Committee, Harbour Offices, Southwick.

WANDSWORTH.—June 7th.—For making up Bracken-avenue, Putney, for the borough council.—Borough Surveyor.

Efficiency in Pumping is guaranteed by the use of Rotoplunge Pumps.

They are positive in action, and by greatly improved methods of construction wear is reduced to a minimum. They give a constant flow and operate without shock. Rotoplunge Pumps represent the highest standard of mechanical science and simplicity of construction; they are without gear or valves. All parts are automatically lubricated by the water, and are easily accessible. As the outcome of several years' work the Rotoplunge has been perfected, and can therefore be purchased with the assurance that the [illegible]

Rotoplunge Pumps have no equal for Pumping Drainage, Sludge, Tar or Sewage

Rotoplunge Pumps

AN APOLOGY.

The Government, during the last six months, has had first call upon our resources, orders having been received for nearly £20,000 worth of Portable Water Filters for H.M. WAR DEPARTMENT.

We are ahead of our stipulated time on this contract, and can therefore better offer our services to Public Bodies, Surveyors, and Civil Engineers, in connection with this branch of Hydraulic Engineering in which we specialise.

Advice given and complete specifications and estimates free of charge for Ejectors or Air Lifts, Water Filters, Softeners, or Sterilisers, and for all Apparatus in connection with the Raising or Purification of Sewage.

WATER LIFTING, FILTRATION, SOFTENING, STERILISING. **SEWAGE** LIFTING, PURIFYING, STERILISING.

EMLY.—June 7th.—For the supply of broken dressed tarred macadam and chippings, for the urban district council.—Mr. F. C. Heath, clerk, Emly, Wakefield.

WITHERNSEA.—June 8th.—For the construction of tar-macadam footpaths, for the urban district council.—Mr. J. H. B. Kirton, surveyor.

LEPTON.—June 9th.—For works of kerbing and channelling, for the urban district council.—Mr. J. W. Senior, surveyor.

CRANBROOK.—June 9th.—For steam rolling and scarifying, for the rural district council.—Mr. S. F. Williams, acting clerk.

EASTBOURNE.—June 9th.—For private improvement works, for the corporation.—Mr. A. E. Prescott, borough surveyor.

BOLLINGTON.—June 9th.—For the supply of 300 tons of granite macadam, for the urban district council.—Mr. S. Knight, clerk, Council Office, Bollington, near Macclesfield.

STAMFORD.—June 10th.—For the supply of 1,000 tons of broken granite, for the corporation.—Mr. F. R. Ryman, borough surveyor and engineer.

WESTMINSTER.—June 10th.—For the execution of paving works and the supply of wood blocks, for the city council.—Town Clerk.

DURHAM.—June 11th.—For the supply of about 12,000 tons of granite cubes and other size granite setts, for the county council.—Mr. Albert E. Brookes, county surveyor, Shire Hall, Durham.

TIPPERARY.—June 12th.—For the supply of four 6-ton end-tipping wagons, for the county council.—County Surveyor, Court House, Nenagh.

EAST SUSSEX.—June 14th.—For hiring steam rollers and scarifiers, for the county council.—Mr. Fred J. Wood, county surveyor, County Hall, Lewes.

TREDEGAR.—June 15th.—For the supply of 375 tons of 2½-in. granite, and 75 tons of ⅜-in. to ¾-in. granite chippings, for the urban district council.—Mr. H. J. C. Shepard, clerk.

TOTTENHAM.—June 15th.—For tar and asphalt paving repairs, for the urban district council.—The Engineer.

LEWES.—June 18th.—For road rolling and the supply of 600 tons of 2-in. broken granite and 600 tons of broken surface-picked flints, for the corporation.—Borough Surveyor.

GUILDFORD.—June 18th.—For the supply of granite, for the rural district council.—Mr. J. Anstee, surveyor.

Sanitary.

CUDWORTH.—June 7th.—For the construction of sewage disposal works, including screen chamber, detritus tanks, liquefying tanks, storm tanks, percolating filters, sludge beds and humus tanks, for the urban district council.—Mr. W. T. Lynam, engineer and surveyor, Council Offices.

BLAYDON-ON-TYNE.—June 8th.—For the removal and disposal of ashpits, for the urban district council.—Mr. R. Biggins, sanitary inspector.

SEDGEHILL.—June 8th.—For the removal of house refuse, for the urban district council.—Mr. T. Spencer, clerk.

WANDSWORTH.—June 10th.—For surface drainage at Putney Vale cemetery, for the borough council.—Mr. P. Dodd, borough engineer, 215 Balham High-road, S.W.

HAMBLEDON.—June 12th.—For the collection and removal of refuse, for the rural district council.—Mr. F. Smallpeice, clerk, 138 High-street, Guildford.

BLYTH.—June 21st.—For scavenging the village of Carlton, for the rural district council.—Mr. A. E. Hewett, 78 Highland-grove, Worksop.

Stores.

WESTMINSTER.—June 14th.—For the supply of coal, coke, gas and hot-water fittings, stoneware gullies, sewerage and drainage works, shovels, picks, sewer implements, and edge tools, for the city council. Mr. John Hunt, town clerk.

Miscellaneous.

WATERFORD.—June 11th.—For the supply of two sleeping vans and a steam drilling plant, for the county council.—Mr. J. Bowen, county surveyor, Dungarvan.

Vol. XLVII. JUNE 11, 1915. No. 1,221.

Minutes of Proceedings.

Heavy Traffic. In June last an important deputation from the County Councils Association waited upon the President of the Local Government Board for the purpose of laying before him the views of the association on problems connected with heavy traffic. Prior to this a report, based upon definite evidence as to the extent of heavy traffic throughout the country, and as to the amount of the consequent damage to roads had been prepared. This report, which has been laid before the Departmental Committee which is at present considering the whole subject, has recently been made public, and is a most interesting document. Dealing in the first place with traction engines, the report states that, of course, the amount of this traffic varies considerably in the different counties. In some, where there are quarries, brickworks, or similar industries, a very large number of traction engines run regularly over the roads to the railway stations, and this is sometimes so far recognised as a necessary part of a local industry that a few highway authorities appear to expect nothing in the way of compensation for damage done by them to the roads. The damage, however, in such cases is undoubtedly very serious indeed, and in those counties where the industry and traffic is not purely local it is strongly felt that it is unfair that the special industry benefited should not be called upon to contribute towards the extra expense. Thus in Cornwall the traffic between the mines, quarries and ports has practically destroyed the connecting roads. Berkshire, Oxfordshire, Staffordshire, and Worcestershire, among other counties, suffer very considerably from this class of traffic, but it is perhaps most severely felt in several of the Welsh counties.

The hauling of agricultural machinery by traction engines is common in most parts of the country, and is described as being most destructive to the roads, especially in the wet season. The conveyance of roundabouts and so forth to fairs is a serious item. In Lancashire, however, it appears that traction-engine traffic is almost entirely limited to the carriage of large single indivisible articles. As regards the question of increase or decrease of this class of traffic, experience seems to differ widely. In Lancashire there has been no great increase in the past fifteen years. In Middlesex it is said to be now only a minor factor. In Glamorgan also it appears to be not increasing, and in some parts there is an opinion that traction engines are giving way to heavy motors. On the other hand, in Carmarthenshire, Leicestershire and Oxfordshire, it is definitely stated to be on the increase, while there seems no indication of any appreciable decrease in the country generally. In a few counties it is stated that the main roads generally are capable of bearing this traffic, if moderate in extent, but practically nowhere, except where the roads have been reconstructed, are they considered able to bear it if continuous in character. A number of counties have given definite instances of lengths of road so seriously damaged by this traffic as to need reconstruction. In a few cases it has been possible to recover damages for "extraordinary traffic," but the existing state of the law on this point is felt to be very unsatisfactory, and but little benefit can be obtained from it. The association's suggestions that an adequate annual licence fee should be charged for traction engines, and that the daily travelling fee should be raised to at least 10s., are strongly supported by the individual county councils and their surveyors.

The report deals at length with the subject of heavy motor-traffic under five heads: (1) Private traders in their own business, (2) traders plying for hire, (3) railway companies (4) Post Office, and (5) military authorities. In regard to the first of these classes it is pointed out that the extent of this traffic depends very much on the neighbourhood of large towns. The Home Counties probably suffer the most, as such a large number of London firms send out heavy motor cars delivering goods daily over most of the roads in the surrounding country. The second and third classes cover the motor omnibuses and chars-à-banc. It is difficult without very detailed statistics to give an idea of the amount of this class of traffic in any particular area, but enough is known to show that it forms perhaps the most serious part of the problem. As regards classes (4) and (5), the Post Office run motor mail vans on definite routes over many of the principal roads of the country; and the military authorities, apart from the present abnormal conditions, run heavy motors occasionally. There is general agreement that this class of traffic does a very considerable amount of damage to the roads. Two questions thus arise—namely, how far the roads are fit to bear it, and whether anything could and should be done to render the vehicles themselves less destructive. County surveyors who were questioned on the question of speed were practically unanimously of opinion that, whereas these vehicles do very substantial damage at the present legal speed, the damage is greater as the speed is increased. To the question whether matters would be improved if rubber tyres were fitted to all heavy motors, twenty-two surveyors answered in the affirmative, one said "Not materially," and two answered "No." One was of opinion that it would diminish the damage on setts, and, to some extent, on tar-macadam, while another considered that heavy motors and omnibuses with rubber tyres (especially when grooved)

do the most damage, and yet another that, as the speed is greater when rubber tyres are used, the damage to the roads is as great as iron tyres at a less speed. One surveyor points out that it is very necessary to decide *when* a resilient tyre ceases, from wear, to be any protection to the road from the iron tyre or rim. Almost all the surveyors agree that less damage would be done if the width of iron tyres were to be increased. One points out that at present heavy motors are permitted to carry heavier loads per inch width of tyres on far smaller diameter wheels than traction engines, and to travel at greater speed, with the result that they are by far the most destructive vehicles on the roads, even when they comply strictly with the Heavy Motor Car Order, which is not by any means general. The opinion is also generally expressed that the diameter of wheels should be increased and a minimum diameter fixed. Space precludes us from dealing with the remainder of the report at present, but we hope to return to the subject next week.

* * *

A Sewage Works Laboratory.

Although, as a general principle, it is usually accepted that a laboratory is required at every large sewage disposal works, it is doubtful whether the average person has even yet a very clear idea as to the precise need for and use of chemical examination of the sewage and its effluents, and the value of a chemist's work. Also it is more than probable that his ideas as to the arrangement of such a laboratory would be vague. The paper submitted on Saturday last by Mr. James H. Edmondson, F.C.S., chemist and manager of the Southall-Norwood sewage works, at the Eastern District meeting of the Institution of Municipal and County Engineers at Southall is therefore important. Moreover, this paper is written in such a manner as to bring forward various points which, though they may be elementary to the chemist, are not elementary to a good many engineers. Although the various treatises written by chemists deal fully with the points mentioned, they are apt to contain a mass of highly scientific matter which obscures the more simple elementary essential points which ought to be grasped by every person interested in the subject of sewage disposal before he can properly appreciate the value of the chemist's work.

It is interesting to learn that in the case of Southall-Norwood a laboratory of sufficient stability, with the lighting, ventilation, proper protection for the instruments and separate rooms as required, rendered as free as possible from vibration, with sufficient protection from cold and prevention of nuisance from dust and chemical fumes, has been erected, as stated by the author, for £50, while the necessary chemicals, apparatus and fittings cost £60. The only tests recommended by the Royal Commission on Sewage Disposal are those for suspended solids and dissolved oxygen, but the author does good work in pointing out the value of other tests. For instance, the chlorides test is shown to be valuable, as it enables the chemist to compare the domestic sewage with the effluent. Owing to the fact that no degree of purification reduces the amount of chlorine, it is possible to tell whether any sample of effluent is the result of the purification of sewage of a given strength. It would, for instance, be very misleading to obtain a sample of effluent the purity of which was largely due to the original sewage being very dilute, and to take it as an example of purification given to the normal flow. Again, the estimation of the ammoniacal nitrogen is useful as being a fair index of any putrefaction taking place in the tanks, it being noted by an increase of ammonia. In such a case where septic action is not required, it points to the tank capacity being too great, or to the need for tank cleansing. Seeing how frequently the tanks at sewage works are made too large, the value of the test is clear. When a filter shows the presence of an appreciable quantity of nitrites, this is a fairly true index that there is insufficient aëration in the filter, due possibly to its being sealed over. Such a result will demonstrate the need for cleaning the surface of a filter. The estimation of nitrates shows to a certain extent the efficiency of the filters. The clarification test is of exceptional value when considering the question of precipitants. With regard to the incubation test, it is noted that a fairly good sample of effluent, void of nitrate, may show signs of putrefaction, while a sample far worse, but containing nitrate, would keep, but, of course, at the expense of the nitrate. The estimation of the caustic alkalinity of a tank effluent is of great value where lime is used as a precipitant, as it prevents the waste of lime, and also prevents a liquid being obtained from the tanks which, being capable of dissolving organic matter, overtaxes the filters. An excess of lime in the tank effluent, moreover, encourages an objectionable grey growth on the top of the filters.

It will be seen that this paper is of a nature to educate the public, as it gives very clear reasons why proper scientific treatment of the matter of sewage disposal must lead to more economical working, proves that the erection of a proper laboratory is not an exceptional matter, and tells the average layman something of the work of the chemist and of its use and value. When members of local authorities have really grasped the value of scientific working it will lead to a great saving of public money and to the appointment of men properly qualified to undertake the important work of sewage disposal.

* * *

Housing in Scotland.

It appears from the annual report of the Local Government Board for Scotland for 1913 that the problem of housing the working classes is as acute in certain districts across the border as it is in England. The board state that repeated instances of house famine and consequent overcrowding, due to the development of the coal industry in central Scotland, have come under their notice. The reason for this is that the introduction or revival of that industry in any part brings in its train large numbers of miners, resulting in the crowding of existing houses to their utmost capacity and the pressing into service of many houses that have become derelict. Private enterprise has apparently failed to meet the need, and the only remaining alternative is that local authorities should provide the required houses. This report may be regarded as the "text" of the excellent paper on "Municipal Housing," which was read at the Ayr meeting of the Institution of Municipal and County Engineers last week by Mr. W. A. Macartney, ASSOC.M.INST.C.E., the burgh engineer and surveyor of Johnstone. The figures which he gave in regard to that town afforded a striking illustration of his theme. The town is a self-contained industrial one, and during the past three years the population is estimated to have increased by 155. During the same period only sixteen houses have been provided by private enterprise, while no fewer than sixty have been demolished or closed, either owing to the issue of closing orders or to their sites being required for building operations. In these circumstances it is easy to understand that, as Mr. Macartney says, local authorities generally are now waiting for a lead on modern lines and on a comprehensive scale.

In leading up to a discussion of the vexed question of economic rents, the author drew a distinction between schemes for rehousing displaced workers and those schemes which may be described as new housing. As an instance of the former, he cited the large operations of the Liver-

peal Corporation, which had up to the end of 1913 spent no less than £1,135,000 on demolition and rehousing, resulting in an annual charge on the rates of about 1½d. in the £. As a new housing scheme, an instance of that which has been undertaken in the Middle Ward of Lanarkshire, where 150 self-contained houses are being erected for occupation by miners, so designed that they may be let at rents which are at once within the reach of the workers and sufficient to make the scheme self-supporting. From these examples the conclusion was drawn that, while schemes of rehousing may cost more than can be recovered from the tenants by way of rent, there is no reason why, with careful consideration of ways and means, new housing should not be on an economic basis. This result, however, can only be achieved by a careful and unbiassed study of economical methods of construction. In England, local authorities are bound by their own by-laws in the execution of a housing scheme, although cases are not unknown in which the law as to this matter has been disregarded. Scottish local authorities, however, are in a position of greater freedom, for by the Burgh Police (Scotland) Act, 1903, the Dean of Guild Court may, upon a report in writing by the medical officer and burgh surveyor that adequate provision is made for light and ventilation, and with the consent of the town council, in any special case, relax or modify to such extent and under such conditions as the Court may think proper, all or any of the provisions of the Burgh Police Acts with regard to the laying out of streets and the erection or alteration of buildings, and the open space adjoining buildings, provided the Court is of opinion that there are exceptional circumstances justifying such relaxation or modification. Upon this Mr. Macartney argues that, inasmuch as the primary object of building by-laws and statutes is to control those who are blinded by greed or ignorance, it is only reasonable that they should not apply to buildings erected by local authorities, who, like the Government, may be regarded as not susceptible to the same temptations as a private individual. The paper concluded with several practical suggestions as to possible improvements and economies in the actual details of construction.

* * *

The Ayr Meeting.

The annual meeting of the Scottish District of the Institution of Municipal and County Engineers, which was held at Ayr on Friday and Saturday last, must be accounted a conspicuous success. The growing importance of this meeting and the remarkable keenness of the Scottish members was evidenced by the excellent attendance and the well sustained discussions on the papers. Of these no fewer than five were read, and two, together with reports of the discussion which followed their presentation, will be found in our columns this week; while the second day—as is usual at Scottish District meetings—was devoted to excursions, including visits to some of the finest scenery in the land of Burns. The meeting was much gratified by an intimation from the president that the council would welcome the nomination of a Scottish member for the position of president of the institution—an honour which is in every way deserved. Of the two papers which we reproduce in our present issue, the first deals with "The Practice of Road Work," and is from the pen of Mr. R. Drummond, the county road surveyor of Renfrewshire. In these days of "modern highway construction" one is apt to forget the important place which water-bound macadam still holds in the practice of road work; and it was certainly refreshing after the flood of literature on methods of tar construction which has been produced in recent years to find that Mr. Drummond's paper was concerned with ordinary macadam roads. The author particularly emphasised the disadvantages of spreading the full width of a road under repair with metal at one time. This practice not only involves much real inconvenience to traffic, but at the same time renders it almost impossible to produce a satisfactory surface, owing to the necessity of allowing the traffic to plough its way through the newly laid metal. Mr. Drummond was not entirely silent as to the use of bituminous binders, and pointed out that if such binders are used great care must be exercised in strengthening the sides, and so forming a proper resistance to the tendency of the metal to creep laterally. The paper, although short, was of great practical interest and was much appreciated.

* * *

Berwick Sanitary Inspector and the Typewriter.

The strenuous way in which some people fight against obvious and necessary changes may be a revelation of character, but it would not be accepted as an exhibition of common sense. At Berwick some of the old-fashioned councillors appear to have made a dead set against that useful if somewhat unmusical contrivance the typewriter, with the result that there has been a prohibition against it, so far as the sanitary inspector is concerned, upon the minutes of the Sanitary Authority since 1912. Recently it was desired to remove the prohibition because of the fact that the inspector's work had increased. It was pointed out that, if the official had to be constantly writing reports for the Government and the sanitary authority, he would be unable to attend to his duties outside, which were much more important than the production of reports. The full-blooded opponents of the typewriter smelt rank heresy, if not something akin to revolution, in the proposal that the machine be provided. One of them suggested that it was part and parcel of a system of "endless expenses for the benefit of officials. Another was profoundly suspicious that "the next thing would be that a clerk would be wanted to work the typewriter," while it was seriously suggested that the sanitary inspector might make use of the surveyor's typewriter—possibly some time after the witching hour when that particular instrument might not be in use. It is a satisfaction to record that the sanitary inspector will obtain a typewriter, in spite of all these protests, though it is only fair to say that when the dye was finally cast, to the manifest chagrin of the opposition, one of their number, in the fulness of his inexperience and obstinacy, declared gloomily that "the typewriter would not be of any use."

* * *

To-morrow's Meeting at Matlock.

The meeting of the East Midland District of the Institution of Municipal and County Engineers which is to be held to-morrow at Matlock, is of special interest, inasmuch as the proceedings will include a visit to the new sewage disposal works for the town which were recently completed. In addition to this, a short paper will probably be read, but owing to some unavoidable delay in settling the final details of the programme it was impossible to get out the circulars as early as usual. Nevertheless, it is to be hoped that with the promise of an interesting meeting many members will avail themselves of the opportunity of visiting this beautiful town, and so help to maintain the well-established reputation of the East Midland District for good attendance. Mr. E. H. Crump, the surveyor to the Hinckley Urban District Council, who is the honorary district secretary, asks that those who intend to be present should intimate the fact to him not later than this (Friday) afternoon, in order that the necessary arrangements may be made.

Institution of Municipal and County Engineers.

SCOTTISH DISTRICT MEETING AT AYR.

The two-days' meeting of the Institution of Municipal and County Engineers which took place on Friday and Saturday last at Ayr will rank as one of the most successful and pleasurable gatherings held by the Scottish District since its amalgamation with the parent body. If not quite so large as had been anticipated, the attendance of members must have been by no means disappointing to those responsible for the arrangements, who are to be warmly congratulated on the general excellence of the programme. Many delegates of county and burgh councils were among those present, and took a prominent share in the business proceedings—which occupied the greater part of Friday, no fewer than five papers coming in for the attention of the meeting. The weather on both days was all that could be desired, and the excursions — particularly the Saturday trip to the picturesque neighbourhood of Loch Doon—were carried through under the best of conditions. Business opened in the county buildings shortly before noon on Friday, the company including Messrs. Thos. Aitken (Fife County), J. Barker (Dumfries), R. Blackwood (Kilmarnock), J. Bryce (Glasgow), W. A. Chapman (Lanark County), W. Clark (Newport), J. Cullen (Stirling County), Thos. Cole (consultant secretary, London), G. Cunnison (Blairgowrie), D. A. Donald (Grangemouth, hon. district secretary), R. Drummond (Renfrew County), J. K. Frazer (Airdrie), A. H. Goudie (Stirling), F. G. Holmes (Glasgow), A. V. Hart (Dumfries County), H. Inglis (Rutherglen), J. Kirkland (Midlothian County), J. Lang (Ayr County), J. Lee (Paisley), J. L. Lumsden (Kirkcaldy), R. Moir (Midlothian County), D. Maxwell (Carnoustie), J. Murray (Port Glasgow), W. A. Macartney (Johnstone), R. Miller (Greenock), C. A. Mackenzie (Monifieth), Murray (Renfrew County), R. McKillop (Perth), M. B. McBeth (Argyll County), R. McDonald (Ayr County), T. Nisbet (Glasgow), J. S. Pickering (Cheltenham, president), F. Pritty (Prestwick), J. Pritty (Selkirk), J. B. Paterson (Dundee), W. H. Purdie (Hamilton), G. Ross (Clydebank), J. W. Dudley Robinson (London, general secretary), D. Ronald (Local Government Board, Edinburgh), A. Stevenson (Ayr County, vice-president), P. C. Smith (Dunfermline), J. Storrar (Midlothian County), J. P. Spencer (North Shields), M. Sellars (Dundalk, hon. secretary, Irish District), C. C. Smith (London), P. Sinclair (Buckhaven), R. Spittal (Lanark County), Jas. Thomson (Dundee), J. Waddell (Burntisland), Wm. Watson (St. Andrews), Jas. Watson (Lanark County), J. Weekes (Irvine), J. Young (Ayr), C. Young (Coatbridge), and W. Ross Young (Lanark County), members; W. Ballantine (Stirling County), W. H. Ellacott (Midlothian), T. Goodwillie (Fife County), A. Goodwillie (Forfar County), J. M. Hunter (Forfar County), J. M. McGregor (Ayr County), J. S. Rankine (Dumfries County), and J. Scott (Perth County), affiliated members; J. Harkness (Ayr County), R. S. Macmillan (Clydebank), T. Gourlay (Fife County), associate members; Judge Chapman (Airdrie), Treasurer McAllister (Airdrie), Councillor W. Kerr (Ayr County), Councillor J. Steel (Ayr County), Councillor Middleton (Ayr County), Councillor Hendry (Ayr County), John Brown (sanitary inspector, Ayr County), John Craig (sanitary inspector, Ayr County), P. A. Thomson (town clerk, Ayr), Councillor Clarke (Ayr County), Councillor Poe (Ayr County), Councillor Turner (Ayr County), Councillor Russell (Ayr County), J. E. Shaw (county clerk, Ayr County), Councillor Dempster (Ayr County), Councillor Sturrock (Ayr County), Councillor Aitken (Ayr County), Councillor Smith (Ayr County), Dr. Macdonald (medical officer of health, Ayr County), John Sturrock (district clerk, Kilmarnock District), Robert Welsh (district clerk, Ayr District), Peter Paterson (district clerk, Maybole District), Mr. Bell (district clerk, Maybole District), Provost Mitchell (Ayr), Bailies Kerr, Murray, Morton and Stewart (Ayr), Dean of Guild Meikle (Ayr), Treasurer Ferguson (Ayr), J. McFadzean (assistant engineer, Ayr), A. G. Dutch (sanitary inspector, Coatbridge), Dr. Hamilton (medical officer of health, Coatbridge), Councillor Smith (Coatbridge), Bailie Agnew (Coatbridge), Dean of Guild Kirk (Coatbridge), Bailie Kenny (Dunfermline), Bailie Spence (Dundee), Councillor Dunn (Greenock), Councillor Robinson (Greenock), Mr. Picken (deputy town clerk, Glasgow), Bailie Brown (Hamilton), Provost Lang (Johnstone), Ex-Provost Armour (Johnstone), Councillor Nicol (Kirkcaldy), W. E. Whyte (district clerk, Lanark County), R. Lindsay (county sanitary inspector, Midlothian County), Councillor Dobbie (Midlothian County), Councillor Millar (Perth County), W. Shaw (town clerk, Prestwick), Provost McClure (Prestwick), Bailie Cochrane (Prestwick), Councillor Menzies (Paisley), and Bailie Lamb (Stirling), delegates.

The President (Mr. J. S. Pickering) said he should like to take the opportunity, before proceeding with the ordinary business of the meeting, of saying with what pleasure he found himself in the delightful country of Scotland. It was a very great privilege to him during his year of office that he should be permitted to preside over a meeting of the important Scottish District of their institution, and he might say that, by the special desire of the council of the institution, both the secretary and consultant secretary were attending the gathering. Mr. Cole, their late secretary, was, he thought, a familiar figure to most of them, and certainly the life's work that Mr. Cole had devoted to the interests of the institution would be known to all. His kindly presence would, he was sure, add grace and dignity to any assembly. In Mr. Robinson they had a worthy successor, and he had already proved an ideal man in the position he occupied, and would, he was convinced, continue to build up the structure which Mr. Cole had commenced. He was sure that the meeting would result both in profit and pleasure to them, and that they would go back to their respective towns with added interest in the institution to which they had the honour to belong.

SCOTLAND AND THE PRESIDENCY.

In reply to a question, the president stated that the council of the institution would be pleased to receive the nomination of a Scottish member for the position of president, and suggested that the district should take the necessary steps in the matter.

The meeting afterwards proceeded to the consideration of the several papers.

PRACTICE OF ROAD WORK.

By R. Drummond,
County Road Surveyor, Renfrewshire.

[Mr. Drummond has had some thirty years' experience as a road surveyor, twenty-five years of this time having been passed in Renfrewshire.]

This is an age of standardisation. Road materials of most descriptions are standardised, their powers to resist strains and stresses are known, and, given certain conditions, a fairly accurate estimate can be made as to their outcome in the service of the road and their respective merits in carrying new and modern traffic. The time, manner and methods of the application of the materials, however, are yet a speculative quantity, and the writer suggests that

this phase of the question is worthy of a place in the programme at the proceedings of an annual meeting.

In discussing practices of road work, it must at once be admitted that the practice for urban roads might not, and in a great many cases could not apply to rural roads, and the writer desires it to be understood that these remarks exclude wood, causeway, concrete, or any of the more expensive road formations, and are confined to "macadam" work. On this footing, roads, rural and urban, can be dealt with from the same standpoint, and he proposes to deal with the question of the method of practice of laying what is known as "water-bound macadam," and which might preferably be called "ordinary macadam."

In laying ordinary macadam, the practice of using water with mud or some soft earthy matter for binding or blinding purposes is still prevalent in many districts, and one of the reasons sometimes given for doing so is that the expense of procuring or using better binding materials cannot be afforded. Experience has shown that macadam laid on the mud and water principle is, in the end, the most expensive, and for carrying mechanically propelled traffic gives the poorest results.

For roads carrying a light or medium traffic an improved system of laying macadam is to bind the metal with whin or granite chippings, and, if laid in winter, the moisture in the road will keep the surface quite good until the dry weather permits of tar-spraying in the spring. If the metal is laid during summer, the binding should be tar-sprayed as the work proceeds. For roads with heavier traffic the same process of metalling should be carried out, if possible during the summer months only, and the surface consolidated with a more liberal application of tar or bituminous mixture. These methods give excellent results, and if the chippings are accounted as metal, the saving in the work of procuring and applying mud and water, to a considerable extent, meets the cost of the bituminous binder; besides, the extended life of the road surface, resulting from the use of a bituminous binding, effects a material saving.

The practice of covering the road with metal full width at one time is not to be commended. It is impossible to produce a satisfactory surface if the passing traffic is allowed to plough its way through newly laid metal, and it not infrequently happens that no watchman or signal is left to warn road users of the condition of the road surface. In such cases no wonder there is a general howl by all those who have to pass that way, and have no option to go round by another road, as is frequently possible in urban areas. On very secondary or third rate roads full width coatings may be laid without inconvenience, but where the road is of any importance—the plea of not wide enough not excepted—the method of coating half width at a time is much preferable; by no other means can the metal coating be well and truly laid, and a properly finished surface obtained.

Another important factor in the practice of road work is the proper and discriminate use of the steam road roller. Too much rolling previous to the metal being properly packed sets up an irregular, wavy surface, and particularly so where mud and water are used as the binder. Rolling and metalling in half widths permit of proper care being exercised in workmanship, and keeping traffic from passing over the metal until in a proper condition to receive it. This practice involves a watchman and the rolling plant left on the road to guide the traffic out with working hours and over night, also to guard the new coating previous to its becoming set or consolidated. It also is economical in respect that no time is lost removing the roller at night or fetching it in the morning. As a set-off to the expense of providing a watchman, a full day's work on the road is obtained, and the public are warned and guarded against unrolled metal, which gives rise to frequent complaints.

An old-fashioned practice of keeping a round contour and open water channels along the sides of the carriageway is no longer feasible. If a bituminous binder is used great care must be exercised in strengthening the sides and forming a side resistance to keep the metal from creeping laterally, or, failing provision in this direction, the benefits accruing from a bituminous-bound surface are quickly lost. Even an open side ditch near the fence may be a source of weakness, and great advantage may be derived by piping and filling up the open ditch; thus the surface water is quickly disposed of and the roadside weighted to help in keeping the carriageway from spreading. On roads carrying heavy traffic resort may be had to more drastic means, by laying a line of heavy submerged stones or kerb to stop the spreading process. In the town or urban area this is unnecessary, as the side walk, with its kerb and channel, fulfils that purpose.

Of no less importance in the practice of road work is the grading and spreading of the metal. In the author's experience, each grade or size should be separately applied, instead of first mixing the various grades into one mass before application. Good spreading is of first importance, and it is very difficult, if not impossible, to make good work from a mixture. With the specification recommended by the Engineering Standards Committee proper grading is easily accomplished, and if properly spread the risk of inequalities and waviness of surface are largely eliminated.

In dealing with the results to be obtained there is always the human element to consider. Men of aptitude and skill must be obtained and trained to the work, they must be directly employed and encouraged to remain in the service. The time when any kind of man was thought to be fitted for road work is gone, and without a full and efficient staff road work can never be properly executed.

It is not proposed to refer to practices in connection with roads carrying extremely heavy traffic; such roads require special treatment, special materials, and special machinery. The aim of these notes is rather to bring under review the work and practice as carried out on the average roads throughout the country, and where ordinary metal coatings, if properly laid and properly bound with some sort of binder other than mud and water, would be capable of carrying satisfactorily a large volume of traffic and meet all requirements at the present time. To some extent these notes are a reiteration of what the writer put forward and urged a few years ago, and he now desires to emphasise that experience and time have now proved beyond a doubt that the newer methods or practices are essential for modern requirements, and that they are a real economy.

DISCUSSION OF MR. DRUMMOND'S PAPER.

MR. W. A. CHAPMAN (Lanark County), opening the discussion, said he thought the day had passed when surveyors used mud for the resurfacing of roads. In his own county the costs were going back, and, as a matter of fact, that was due to the improved binders employed and the extensive use of tar-macadam and surface-tarring. His last year's expenditure was reduced some £645, and this year would be further reduced. Mr. Drummond had referred to the practice of dealing with the whole width of the road at a time, but in that connection he did not agree that the services of a watchman were required to warn road users of the condition of the surface.

Mr. R. SPITTAL (Lanark County) said he did not agree with the author that on important roads the method of coating half width at a time was much preferable. He did not think that was so either with ordinary or tar macadam. In his experience, try as they would, they could not obtain a proper join. With regard to the question of ordinary water-bound macadam as against tar-macadam, it was realised by every road surevyor that if they could only get the necessary money tar-macadam was what should be put down. They were governed by the amount of money placed at their disposal.

Mr. W. BALLANTINE (Stirling County) said the observations which Mr. Drummond had made in his paper were serious truisms which all road surveyors there would entirely agree with, and therefore there was little ground for criticisms from them. If they carried out the suggestions put forward he had no doubt they would succeed in the work before them. There had been a great step in advance in the work of road maintenance in the past ten years, and they had got on to fairly satisfactory lines in regard to the main roads. He agreed with Mr. Chapman as to the necessity of using some binder on all their main roads; that was being done generally throughout the country, and more especially since the institution of the Road Board, with its grants for the improvement of roads crusts. Tar-macadam in one form or another had been adopted for all the through roads in the county of Stirling. Those that had been down for three or four years now only required resealing and keeping up with a little spray and patching year by year, and the cost of those roads would be gradually reduced. That was the aim and object they had in view. For country roads in rural places,

where the traffic was ordinary and the assessable area small, he held there was nothing better than the ordinary macadamised road, and they must continue that system until they could overtake them with the more modern methods. Mr. Drummond did not commend the practice of covering the road with metal full width at one time; but with a 30-ft. road it was quite possible to do one half at a time, and so preserve the material from being destroyed by the traffic as soon as it was laid; but on an 18-ft. road it was simply impossible to do that satisfactorily. In such a case one did not get a uniform pressure over the half of the road as on the whole, and accordingly he thought it was better to do the whole width at one time. While referring to that point, he might put in a plea to their motorist friends to put up with a little inconvenience while repairs of that kind were going on.

Councillor Dobbie (Midlothian County) put forward a suggestion for the conferring on surveyors of power to close to traffic without notice roads which it was intended to repair. If that could be done the result would be the avoidance of a tremendous amount of damage that was at present done to new roads by people who insisted upon going on to them before they were in a proper condition to withstand the passage of vehicles.

Mr. R. Moir (Midlothian County) spoke of the damage done by heavy motor 'buses going on to newly made tarred roads, and suggested that the county council ought to have more power in regard to the closing of these roads against such traffic while such operations were proceeding.

Mr. M. Sellars (Dundalk) agreed that, where a road was less than 18 ft. in width, it might be coated with one operation, although he admitted it was a hardship to motorists.

Mr. R. McDonald (Ayr County) put an inquiry as to whether Mr. Drummond made use of machine or hand broken chippings. In water-bound construction the machine did not bind so well as the hand broken material.

The President (Mr. J. S. Pickering), in closing the discussion, asked Mr. Drummond to accept the thanks of the meeting for his very interesting paper. Mr. Drummond had made an interesting remark in regard to making roads in half widths. He did not think that engineers were generally in agreement with the author in that respect, and if it went forth that they were, he was afraid they would have a bad time with the motorists. It was certainly inconvenient to have the whole stretch of road under repair at the same time, but his own experience was that one got a better job by doing the whole width at once instead of in halves. He was rather surprised the author's experience was different, and that he could make a road satisfactorily in the manner suggested. The matter of the closing of the roads was important. In boroughs, of course, they could do that as they chose, but not on main roads, where there was no thoroughfare on to which the traffic could be diverted. As to watchmen to protect the road, where there was the slightest danger he considered their employment most desirable.

Mr. Drummond, in replying, said he desired at once to make himself clear in regard to the point as to the method of repairing roads. They must not think for a moment that he regarded the half width method as the best thing. The better way was, of course, to coat the whole road at once. But the fact remained that in the country they had no power to shut their roads when they declared them dangerous, and as he went through the country he came across numerous places where roads were being done full width when the half width method would have ensured a good job. He held the opinion strongly that if they were doing a road they could not shut, and did it otherwise than by half width, they did it wrongly, and he insisted there was no difficulty in doing it half width if they went about it rightly. It was not unusual to find, with the other method, material all over the road, and the traffic plunging through the metal. It was that practice he condemned, and he had no other object in advocating the half width than to get the best results. As regarded the mud-and-water principle as against any other principle, his experience over a considerable number of years had shown him that it was a most expensive method. When people complained that they had no money to enable them to do otherwise, his reply was, "Why do you continue the most expensive system when you have the least money to do it?" Mr. Ballantine had said that it was impossible to bind with [illegible]. He disagreed; it was quite easily done. His view was that the over-rolling that went on accounted for the waviness that occurred. But the 18-ft. road was as easily divided into two and the work easy of accomplishment if they went the right way to work—which was to protect their metal while it was on. As to binding with chippings, he used both machine and hand broken, and found no difference between the two.

MUNICIPAL HOUSING: A PLEA FOR ACTION, AND AN INQUIRY INTO POSSIBLE ECONOMIES IN SCOTCH HOUSE CONSTRUCTION.

By Wm. A. Macartney, Assoc.M.Inst.C.E., Burgh Engineer and Surveyor, Johnstone.

[Mr. Wm. A. Macartney was educated at Dunoon Higher Grade School and the Royal Technical College, Glasgow. He was trained in the office of the burgh and water engineer, Dunoon, first under Mr. Chas. Mackintosh, F.S.I., M.C.E.I.A., and later under Mr. Jas. Andrew. For some time he acted as chief assistant to Mr Andrew, when among other important works the East Bay esplanade and harbour were constructed at a cost of £40,000. In 1906 he received the appointment of assistant to Mr. John Bryce, M.Inst.C.E., burgh engineer, Partick, and three years later became his chief assistant and deputy. In October, 1912, he was appointed, from a large number of applicants, and without the usual formal interview, burgh surveyor and sanitary inspector of Johnstone. Mr. Macartney is an associate member of the Institution of Civil Engineers, a member of the Incorporated Sanitary Association of Scotland (by examination), and a member of the Institution of Municipal and County Engineers. He is secretary of the Housing and Town Planning Committee of the Scottish district of the institution. Last year Mr. Macartney was appointed lecturer on municipal engineering and town planning in the Royal Technical College, Glasgow, this being the first class of its kind in any college or university in Scotland.]

When international and industrial conditions are restored to their normal again, one of the most pressing problems which local authorities will require to face will be that of housing. During recent years the Legislature has attempted in many ways to stimulate action in the matter, with only a very moderate amount of success. The disease has certainly been diagnosed, but such efforts as have been put forth to combat it have not done much more than expose its magnitude and its evil influences.

The facts are well known to all. They have been commented on in numberless annual reports for some years back. In brief, they amount to this: the increase in the number of houses built is not keeping pace with the growth of the population and the developments of industry in many districts.

A few figures applying to a self-contained industrial town will possibly illustrate the state of things just as effectively as a return for the whole country. In the three years the writer has been in the burgh of Johnstone, the total valuation of the buildings passed by the Dean of Guild Court has been nearly £50,000. Of that sum, £7,000 represents the value of dwelling-houses, and the remainder is made up of extensions to public works, schools, and halls, and alterations to business premises. This £7,000 provided a total of sixteen houses, while during the same three years no less than sixty houses were demolished or closed, either owing to the issue of closing orders or to build-[illegible]

the population is estimated to have increased from 12,000 to 12,200. Hence, although there have been [illegible] additions to public works, and a perceptible increase in the population, the actual number of available houses is forty-four less than three years ago.

Figures much more impressive than these could doubtless be submitted by many members of the institution, and had the report of the Royal Commission on Housing been forthcoming, nothing further would require to be said. In its absence it may be permissible to insert two other extracts which show in a little detail two different aspects of the subject.

In a semi-official* report reference is made to two outstanding features in existing housing conditions—viz., (1) the existence of many overcrowded slum areas, and (2) a marked scarcity of houses—and it is remarked, "The large slum areas are, of course, most prevalent in the largest towns, where the very worst effects are found. The absolute scarcity of houses, on the other hand, is more directly an urgent problem in the middle-sized and smaller towns; but even in these this scarcity contributes greatly to overcrowding in such houses as there are in these towns and villages. . . . In Cromarty and Lerwick, for example, as well as in larger towns like Greenock, Dunfermline, Wishaw, &c., there is this economic demand for housing accommodation for people who can pay the necessary rent, and the absence of the necessary houses has the effect not only of increasing the overcrowding in the houses that are available, but also of increasing the rents of these houses."

In an official† report the following is stated: "Repeated instances of house famine and consequent overcrowding, due to the development of the coal industry in central Scotland, have come under our notice. The introduction or revival of the coal industry in any part brings in its train large numbers of miners, who have to be housed. The result is that existing houses are crowded to their utmost capacity, and houses that have become derelict are pressed into service wherever possible. . . . The colliery company maintain that they have no duty to provide these houses, that they have more profitable uses for their capital, and that little return can be secured on any outlay. . . . Private enterprise shows little signs of meeting the situation, owing to the increase in costs and the small rent paid by the miner. There remains the alternative of the local authority providing the necessary houses."

It is, then, an indisputable fact that private enterprise, so long depended upon, has within recent years failed. To inquire into the reason for this would be to stray beyond the bounds set for this paper, and would but obscure the ultimate aim in view.

The town of Greenock was the first burgh in Scotland to adopt Sir Richard Cross's Artisans' Dwellings (Scotland) Act, 1875, by proceeding with an improvement and rehousing scheme in 1877. Other towns, even in the days when private enterprise was in her lusty prime, have followed with schemes of varying success. These were often expensive, so that, while furnishing many lessons and much experience, the chief thing many authorities learned was that in housing matters it was advisable to

"Think weel ere fear ye rue it"

—a not invaluable lesson too.

Authorities generally are now waiting a lead on modern lines and on a comprehensive scale, and surely that will not be much longer delayed.

On examining the arguments for municipal housing, other than that of real urgency, we find, as has been mentioned before, municipalities are being asked to take up housing because private enterprise has failed to keep pace with local demands. What will be said if it is suggested that local authorities should take up a more advanced position, and drop this apology for its housing schemes, whether they be rehousing or new housing? It is said that private enterprise is better able to build houses than a public authority, and, in fact, this idea has been dinned into one's head for so long that it is accepted without hesitation or qualification. Of course, it may be true to a greater or lesser extent, but in that case, or, as old Euclid would say, "similarly," private enterprise must also be better able to build waterworks, gasworks, tramways, wash-houses, and a score of other recognised factors in modern communal life. In this climate a substantial and healthy shelter of some kind is one of the necessaries of life, and it is putting the cart before the horse to provide water, gas, sewers and roads, and put the onus on others to provide the house.

Of course, this is a very heterodox view to put forth, but many old ideas are at this time going by the board, and perhaps this argument will take a little looking into. It is not suggested that private enterprise should be harassed or hindered in the slightest—rather let it be encouraged—only it is suggested that local authorities and their officials should adjust themselves not only to the need, but the trend of the times.

There is this further thing to be said: In the past property has been looked on as a sort of gilt-edged security. A man with a little money was pleased to invest it in a building scheme because he could see where his money was placed; now, for various reasons, property is not so favoured by money-lenders, and the rate of interest on bonds and mortgages is high. Local authorities can borrow money more cheaply than a private individual, because of the better security they can offer, and for a housing scheme the Government offer authorities money on very reasonable terms, both as regards rate of interest and period of repayment of loan. Even if a local authority decides to proceed with a housing scheme, it must still employ masons, carpenters, plasterers, &c., to erect and finish the houses, so that, after all, its work is confined to designing, supervising, and capitalising, and the builder has not been so very successful in recent years that he need object very strongly to being relieved of these functions.

At this stage it may be advisable to point out that what is called municipal housing really consists of two separate and distinct sections—viz., rehousing and new housing. Each of these raises difficulties, but the former, from the nature of the case, is always of an expensive nature, and never wholly satisfactory.

It is easy in certain cases to shut up houses which have become uninhabitable, but unless provision is made for the people dispossessed, they will possibly move into other dwellings in the same district, perhaps already inhabited, and cause more overcrowding and worse conditions than those they have left.

Again, there are properties and areas which, though in a bad way, cannot be closed, though the conditions are such that they are a source of danger to the health of the district.

In both cases the duty of the local authority often resolves itself into the purchase and demolition of the old properties, and the rehousing of the old population in new and improved dwellings on the same site.

The city of Liverpool furnishes good and concrete examples of rehousing the poorest classes. According to a report,* up to the end of 1913 Liverpool had spent £1,135,000 on demolition and rehousing, the nett charge to the ratepayers on the whole outlay since 1864 being £37,000 per annum. The cost of the special policy of housing the people alone is £22,700 per annum, a matter of 1½d. per pound on the rates. Liverpool, however, does not grudge this sum, as she considers the money well spent, affecting as it does the health and moral welfare of all the citizens. She has now 2,174 new dwellings under her charge, and a population of 8,103, every one of whom has been turned out of an insanitary house, a cellar, or an overcrowded room.

In the carrying out of such work one's hands are tied in many ways—for example, in the number of houses to be erected, and the height and style of the houses. Such work, in fact, depends so much on local circumstances that many of the ideas mentioned in the latter half of this paper would possibly not apply. These refer more to the erection of new houses to relieve the congestion and scarcity already existing in many towns and districts. A good example of this new housing is to be seen in the Middle Ward of Lanarkshire, where 150 houses of the self-contained type are being erected for miners by the District Committee. Each house, of the dominant type, is equipped with bath-room, scullery, pantry, coal store, and living-room downstairs, and two or three bedrooms upstairs. The houses are to be let at rents within the reach of the workers, which rents, at the same time, will be sufficient to make the scheme self-supporting.

This raises the question of uneconomic or economic rents, the schemes just referred to furnishing us with an example of each. The opinion of the writer is

* "Scottish Land." Hodder & Stoughton, 1914.
† Annual Report of Local Government Board for Scotland. 1913.

* "Rehousing the Dispossessed in Liverpool," by Colonel G. Kyffin-Taylor, V.D., M.P. 1914.

that, while schemes of rehousing may cost more than can be recovered from the tenants by way of rent, there is no reason why, with careful consideration of ways and means, new housing should not be on an economic basis, and this without increasing the rent, so that, as sometimes happens, the class that the dwellings are intended for are unable to pay for them.

Such a result requires that local authorities, and particularly their surveyors, be prepared to study the subject of building construction with minds free from the bias which tradition and custom engender. They must also remember that the letter of the Burgh Police Acts is not really inspired or infallible, nor are the various by-laws, good as they are, the last thing which may be said on the subject. We have for some time been accustomed to complaints from architects and builders as to our general building regulations. These complaints have usually been lacking in definiteness, and the complainers have not been able to show us how we could do our business without statutes and by-laws. We, on the other hand, have flattered ourselves that, by sitting tight and refusing concessions of any kind, we have been just and fair to all alike. The author would suggest that this policy of sitting tight can be carried too far. He is aware of the great difficulties that await the authority which is hardy enough to use discrimination, but, despite that, there are times when this must be done, and one of these times is now.

Such a practice is in harmony with the Burgh Police (Scotland) Act, 1903,* and sec. 39 is quite clear and emphatic on this point. It states: "The Dean of Guild Court may, upon a report in writing by the medical officer and burgh surveyor that adequate provision is made for light and ventilation, and with the consent of the town council, in any special case, relax or modify, to such extent and under such conditions as the court may think proper, all or any of the provisions of the Burgh Police Acts with regard to the laying out of streets and the erection or alteration of buildings, and the open space adjoining buildings, provided the court is of opinion that there are exceptional circumstances justifying such relaxation or modification."

Another reason for modification of by-laws suggests itself. While burghs act under the Burgh Police Acts, the county districts, even though perhaps more truly urban than many burghs, are not so placed, and they may allow buildings to be constructed which do not comply with these Acts in various important particulars. Where there are county by-laws in operation, these are generally less stringent on the constructional side than those, possibly, in adjacent burghs. One illustration will show what may sometimes happen. Plans were sent to a burgh surveyor for a timber and iron house of the bungalow type to be erected on the outskirts of the town. The plan was defective in several respects, and particularly in regard to ceiling heights. These defects were pointed out and the plan was withdrawn. Shortly afterwards the house was erected outside the municipal area, according to the original plan, the county officials making no objections. The position is certainly anomalous, and as it will be impossible to bring counties into line with burghs, it may be suggested that the burghs might obtain a little of the freedom which the county districts enjoy without allowing that freedom to degenerate into licence.

The final agreement, as it seems to the writer, is this: By-laws and statutes are meant to keep in check those blinded by greed or by ignorance. The Government is free from the ordinary building restrictions, and we do not object to this, because, for one reason, the State is supposed not to be susceptible to the same temptations as a private individual.

In the same way, then, it is now suggested that a local authority should take advantage of the powers given and amend her systems of construction so that she may supply the worker with a good house at a moderate rent. Of course, under a town planning scheme, power to amend by-laws may be given, but this more cumbrous process is not necessary in a simple housing scheme.

Coming now to the actual details of Scottish housing, it may be premised that in the past municipal housing has consisted chiefly in the erection of tenement houses. It is the fashion nowadays to decry this type, and to say that working men want cottages. The statement does not appear to be generally true, as the author could give instances of intelligent working people leaving self-contained houses to reside in new tenements. It may be true that certain sections may talk of cottages, but these sections are small, and the mass of the people need to be educated up to the cottage type of house. In rehousing schemes the cost of land and other considerations will possibly demand houses of two or even three stories. As practical men let us not condemn the system unless we can show a better one for such situations. The tenement is not wholly evil; in fact, when well planned and constructed it has a number of advantages over all other types of construction, and as long as people desire it, and the conditions demand it, so long will it remain with us. We can, however, remove its worst fault—viz., its height. Four or five story blocks should not be allowed, and even three stories should only be considered in wide streets.*

Cottage or semi-detached houses are often reserved for the outskirts of the town, or where land is cheap. The transit question consequently affects them, and tends to hinder their popularity. In fact, the solution of the transit question would go a long way to solve some phases of the housing question. A well-managed tram service is a great boon, and its lines should be laid down in advance of the building scheme if possible. Further, a rearrangement of working hours in factories and workshops is a desiderata, and the following suggestion has much to be said for it†: "The meal hours at present in most of the works are only three-quarters of an hour. For a man to walk fully a mile and back, and take a meal in that time would, in my opinion, do him more harm than good. Then there is the alternative of carried food, chiefly tea—another objectionable proceeding. My idea, which I fear will not be popular, especially among the younger men, would be to start later in the morning, take breakfast before starting, have one interval of, say, one and a-half hours for dinner, and work a little later at night and on Saturdays. If such a system were universal, men would not be so averse to living a little distance from their work."

Building construction in Scotland is, generally speaking, substantial, and we are in the happy or unhappy position of having no official "model" by-laws to bind us, though many towns have their own by-laws. Perhaps we build too substantially, and find that the shell of our houses is sound, while the design and details of construction and finish are quite out of date. An ordinary dwelling-house which survives for the Psalmist's "three-score years and ten" surely does well enough.

The suggestions for more economical construction of municipal houses which follow are based on the arguments which have been already adduced—(1) that it is necessary to proceed with municipal housing schemes in many districts to-day; (2) that to do so successfully some modifications of existing building practice and regulations are called for; (3) that, even though these modifications render the building less substantial than has been the case heretofore, so long as the life of the building exceeds the period allowed for repayment of loan, that should be considered sufficient.

Most of the economies to be mentioned have been dealt with before, but their applicability to Scottish conditions has not, so far as the writer is aware, been brought before our members, and they will, it is to be hoped, evoke a good discussion now.

Taking them in the order in which they generally come, and not in that of importance, we have:—

FINANCE.

It needs no demonstration to see that the more cheaply money can be obtained, the better success the scheme will be. Unless in exceptional circumstances, however, the best terms will be obtained from the Public Works Loans Commissioners, and their general conditions, that the cost of buildings must be repaid in sixty years and the cost of land in eighty years, cannot be taken exception to.

SITE.

The choice of a site is a very important matter indeed. Where a rehousing scheme is contemplated, the site is already fixed and must be made the best of; but for new houses a selection is generally possible. In the latter case busy, important streets should be avoided, and sites fronting possible costly new streets should also be looked on with disfavour. Quietly situated ground, not too far from the centre, where underbuilding will be reduced to a minimum, and with gravel or loam, or other suitable soil, where concrete or asphalt under the ground floor is unnecessary,

* See sections 39, 40, 61 (6).

† From Annual Report for 1914, by M. H. Taylor, M.D., M.O.H., Johnstone.

would be the ideal site. In many places such land should be obtained at a moderate ten dality. It is not necessary to have the houses fronting to a wide road, and various types of crescents and hollow squares, favoured in many garden suburbs, to keep down road and sewer charges, may be adopted with advantage. Savings may also be effected by making the buildings suit the site, and placing, as much as possible, the longest dimensions of the houses parallel to the contour lines. The number of houses which may be placed on a nett acre is a very important point, and not to be disposed of on ideal or theoretical considerations alone. In a large burgh of over 70,000 inhabitants, the writer found, a few years ago, that the new houses being erected varied from eight per acre on the villa area to seventy-five per acre in the heart of the town. The latter were of the two-roomed kitchen type, and were in accordance with the Police Acts. The first excuse for this great number of small houses was the cost of land, and the second was the desire of the builders to get as much out of their ground as their neighbours. This second reason need not weigh with a municipal housing scheme, but we must get cheap land at £100 per acre or less, and not exceed one-fourth of that sum if we wish to provide a moderate number of houses to the acre.

DESIGN.

The favourite house of the working classes is, undoubtedly, the room and kitchen, and the two-room and kitchen flat, and, while the number of apartments is small, it must be added that the cubic contents of these houses will compare favourably with those of double their size (as regards apartments) south of the border. While it cannot but be admitted that for health and other reasons it would be better to have the great cubic space split up into more compartments, yet we cannot get away from the fact that the Scotch "kitchen" is a great favourite which will not be easily displaced by the alternative "living-room." If the room and kitchen design is retained, it will only be economical if built in blocks, a convenient size being four houses on the ground floor and four above, the latter approached by a back stair and balcony. Each house should have its own scullery, with boiler and tubs, bath-room with water-closet and bath, pantry, presses, &c.; but useless corners and long, narrow lobbies or passages should be avoided. Valuable space can be lost in defective planning, so that the cost per cubic foot is not always a guide in determining whether a design is efficient and economical or otherwise.

Where the English type of house is adopted, the standard design, with living-room, pantry, scullery and bath-room downstairs, and two or three bedrooms upstairs, will doubtless be adopted. A slavish adherence to a standard type should not be attempted, but consideration given to local usages and requirements. One barbarous custom in such houses is to put the water-closet outside, entering off a yard; the reason for this in new houses the writer has never been able to discover. This type may be built in semi-detached fashion or in rows. The latter will work out cheaper in a big scheme, but the rows are unsatisfactory unless there is a private service lane behind, and in any case six or eight houses in one block will be sufficient. The cost of the service lane, again, would run away with the saving effected by building in rows.

MATERIALS.

While one need not attempt to keep back the wheels of progress, yet it is advisable to employ new materials only after they have been most carefully tested and proved. Nor should construction be cheapened by using materials simply because they are cheap. It is a good rule to employ the materials found or generally employed in the district, as, strange to say, these often seem to suit local conditions better than, or at least as well as, more expensively obtained stuff. Thus, for example, for walls, either brick, rubble or concrete may be used, depending on the local circumstances; but a mixture of these would be unsatisfactory. Again, as regards roofs, "the introduction of bright red, highly pressed tiles in districts where such a roofing is not generally found is as undesirable as the needless introduction of a blue slate roof into a district where tiles have invariably been employed."* Generally, then, and without particularising further, it may be said that the materials selected should have proved their worth, be suitable for the district, and reasonable in cost. Going on these lines, simple, pleasing elevations will be obtained, satisfactorily serving their purpose. In the report* above, it is pointed out what we may have already discovered—that average tradesmen are slow to take up new materials and systems of construction, and these are often quoted for at higher rates than are really necessary because of their novelty. "Experience has shown that the importation of a standardised plan novel to the district may result in an increase in cost."

CONSTRUCTION.

Mason Work.—Generally, concrete foundations for walls have been proved satisfactory and economical, while for dampproof courses, in the absence of local materials, rolls of asphaltic material are exceedingly handy and serviceable. In the ordinary rubble wall there always appears to the writer to be too much thickness for the strength required, especially in low walls. This is a case which is not subject to by-laws to any extent, but is a matter of use and wont. One often finds rubble walls built with a dressed outside face and an inside face, while the heart of the wall is filled up with mortar and shivers of all sizes. This does not make for strength unless sufficient headers are employed. In houses of two stories only it is suggested that thinner and more compact rubble should suffice, though, if the writer had to choose, he would prefer a brick hollow wall, with two 4½-in. brcks and a 2½-in. to 3-in. chase between. This wall, rough-casted on the face, seems ample for two stories, and the saving it would effect in strapping and lathing would, even in districts where bricks are scarce, possibly more than counterbalance the extra first cost of the materials.

One of the requirements of the Police Act which should be dropped is that referring to skews. These are most unsightly—in semi-detached houses particularly—are expensive to construct, and more expensive to maintain. Unless a property is not over two full stories such a requirement should not be insisted on. It should be quite sufficient to carry the party wall to the underside of the roof sarking. This party wall will possibly be the only brick wall in the house, the partitions being of standard and lath, and if built in cement mortar will do 4½ in. thick, except at chimneys and presses, of course.

Carpenter and Joiner Work.—Here, again, use and wont play a considerable part, and we find heavy timbers used in floors, and particularly in roofs, which seem to be a waste of money. This may be due to wide tenements demanding deep joists, and the habit has spread to buildings of all types, and many architects and builders get into the way of using certain sizes of joists and spars with little regard to the actual spans. Of course, it is difficult in roofs to say where the line should be drawn, as stress diagrams for ordinary roofs are not easily got, and we all prefer to err on the safe side; yet, if a 6-in. by 2-in. spar will do instead of a 6½-in. by 2½-in. spar, the saving will be found to be quite appreciable. A colleague has informed the writer that in a building which he designed, 120 odd feet long, in order to reduce the cost, 6½-in. by 2½-in. roof spars were replaced by 6-in. by 2-in., and the intervals between same rearranged. The result of this was just as satisfactory a roof, and a saving of £100. In roof construction generally it will be found that the less the roof is cut up for windows or other openings, the cheaper will the job be.

Flooring for a long time has been laid on joists at 18-in. centres 1½ in. thick, but in a number of places—for example, a large building scheme of four-story tenements in Glasgow—⅞-in. flooring is being used. The explanation given is that this is sufficient for strength, and as all floors are now covered with linoleum or other floor covering the wear will be slight. In many English cottage schemes deafening is omitted from the first floor, and as each house is in the possession of one family there is something to be said for such construction, though the writer would prefer to have the deafening.

Of course, plain skirtings and facings, instead of moulded timbers, are quite feasible, but framed and lined internal doors have a very cheap look about them, especially in the larger apartments, and a plain panelled door would not cost much more.

Other Works. The ornamental plaster work, coved cornices, centre flowers, &c., should, of course, be omitted, and only a simple round formed at the junction of the wall to the ceiling. This is not only an economy, but is also an advantage from a hygienic point of view, and is really quite pleasing to the eye.

* Advisory Committee on Rural Houses. Report.

* Advisory Committee on Rural Houses. Report

Wall-paper, again, will give place to the healthier distemper, and timber work will be stained.

In connection with drains, a careful planner will take pains to avoid armies of disconnecting traps, whose perforated gratings are generally strong temptations to children to drop articles through and choke the traps. Where the property is a row and belongs to the municipality, individual connections from each house to the sewer are not required, and the saving in intercepting traps and inspection chambers is bound to be considerable, while the maintenance charges will also be reduced.

Cellars and wash-houses in the courtyard had better be avoided. They are often badly kept, and are apt to become unsightly. Parapet walls and railings round feus can quite well give place to light fences and hedges. The latter are perhaps not too satisfactory at first, but they will soon improve, and in the meantime a light form of fence might be erected to serve till the hedge grows up.

Ceiling Heights.—The Burgh Police Act fixes the minimum ceiling heights at 9 ft. 6 in. on ground floor, and 9 ft. on other floors, except attics, where 8 ft. is allowed. These sizes apply to all houses, whether of one or five stories, in all streets, whether wide or narrow, and in all areas, whether open or congested. The mistake of this cast-iron requirement has been often demonstrated and discussed. While the writer does not say that these heights are excessive in the case of crowded town tenements, he is certainly of opinion that to insist on them in all circumstances is unfair and foolish. High ceilings are often pockets for stagnant air, and an increase in floor space instead of wall height would be a great advance. The time seems to have come when some difference should be made on ceiling heights in houses of one or two stories, at any rate, and 1 ft. could be taken off each story without doing much harm. When the building goes beyond two stories, the ceiling heights would require to depend on the width of the road; this, however, is beyond the scope of the present paper. This is one of the points which will doubtless provoke discussion, but intending critics might say why ceilings in England are from 1 ft. to 1 ft. 6 in. lower than in Scotland. The Scottish Local Government Board* recommend the lower heights, and the Dunfermline Burgh has, it is understood, decided to allow ceilings of 8 ft. 6 in. and 8 ft. respectively in new cottages in the town planning area.

Widths of Streets.—Where the building scheme is of any extent it will be possible to avoid considerable expense if streets are constructed to suit the traffic they are likely to carry. This is a point which is continually cropping up in town planning schemes, and though the writer is against narrow lanes being called "roads," yet it is suggested that the 40-ft. street of the Police Acts is too wide for many districts. If the road is a through road, or ever likely to become one, then 40 ft. between the parapets is not too much; but if otherwise, 30 ft. between the parapets, or even less, will do.

Organisation, Standardisation, &c.—These are matters whose presence or absence will affect the ultimate cost to a varying extent. Their value is self-evident, and particularly so in a large scheme. A small scheme, as a matter of fact, will not give an outlet for these, nor provide a satisfactory test of the theories and opinions advanced in this paper.

It is, of course, difficult, if not impossible, to put a value upon the economies suggested. Varying results will be obtained in different places, and it is not possible to realise an ideal in any one scheme. There is this other consideration, too, that one must deal with *ante bellum* prices. The author ventures the opinion that the savings which may be effected will be considerable. In a report issued 1913,† the following figures, prepared by a Glasgow firm of measurers, are given in regard to two sets of plans prepared by a Lanarkshire architect:—

BLOCK OF FOUR ONE-STORY HOUSES.

Plan No. 1.—Cost, according to plans, including street making, £740; cost, according to burghal by-laws, and including street making, £835.

Plan No. 2.—Cost, according to plans, including street making, £820; cost, according to burghal by-laws, and including street making, £928.

The relative figures seem quite reasonable, and tend to show the differences in county and burghal regulations, and the effect of same on costs, even in houses of the same class of construction.

* Memorandum. November, 1912.
† "Lanarkshire Miners and the Housing Question."

The writer has gone into the question as he has seen it in his own district, and the following figures which he submits, while approximate only, may be accepted as correct. They refer to a block of twelve houses in a four-story tenement, and a scheme of semi-detached cottages, both built about the same time and within 3 miles of each other. Both schemes are, of course, built by private enterprise. The tenement is substantially built, with dressed stone front, tiled close, good fittings, and very high ceilings (over 10 ft.). The cottages are, to a certain extent, in harmony with the suggestions of this paper. In each case the cost of the buildings themselves is given, and the cost of street making, sewering and other similar charges is not included.

TENEMENT.

No. of houses, twelve.

Size of houses—eight, one room and kitchen; cubic contents, 5,290 ft. each. Four, two rooms and kitchen; cubic contents, 7,300 ft. each.

Cost per house—one room and kitchen, £315; two rooms and kitchen, £435.

Note.—Cubic contents includes bath-room, bed-recesses, presses, scullery and lobby.

SEMI-DETACHED COTTAGES.

Number of houses, forty.

Size of houses—thirty-six, four apartments; cubic contents, 4,950 ft. each. Four, five apartments; cubic contents, 7,060 ft. each.

Cost per house—four apartments, £220; five apartments, £325.

Note.—Cubic contents includes scullery, water-closet, coals, pantry, presses and staircase.

These figures show—(1) that in this case the cubic feet in the two-apartment and three-apartment tenement houses are greater than in the four-apartment and five-apartment semi-detached cottages respectively.

(2) That with nearly the same cubic capacity, and much better allocation of the space, a semi-detached house built on economic lines may only cost from 70 to 75 per cent of a tenement house.

(3) That the saving shown in this type of construction will mean the whole difference between a moderate economic rent and one which is beyond the capacity or the willingness of the average workman to pay.

Of course, one has to recognise that the cost of a house is really the initial cost plus the amount expended on repairs during its life. Hence, a low initial cost is not necessarily cheap, if the construction is such that in the course of years substantial repairs will be necessary. Conversely, a substantial construction, which, though costing more at the outset, demands few repairs during its lifetime will be cheaper in the long run.

Both lots of houses above referred to were, however, substantially constructed, and one would say that the repairs would be negligible for a long time, though it is possible that the tenement would last longer than the cottages.

DISCUSSION OF MR. MACARTNEY'S PAPER.

Mr. Ross Young (Lanark County) said they had some housing schemes going on now. By one of the schemes they were building 100 houses, by another scheme fifty houses, and he had had occasion to go into the questions raised by this paper, and, on the whole, he agreed with it. There was no doubt, if they wished to build houses for the workmen, of the cottage type especially, they must use every endeavour to cut down expenses to the very lowest minimum. He was, however, satisfied that, if cottages were erected economically, they could house the working classes as cheaply in cottages as in tenements. There was an impression in the past that the house in the tenement was cheaper than in the cottage. Mr Macartney brought out some important figures in the paper when he showed that a one-room and kitchen house in a tenement cost £315, while a four-roomed house in a semi-detached cottage cost only £220, or nearly £100 less. Those were figures to take home with them and think over. Mr. Macartney made the statement, in choosing the site of cottages, that busy, important streets should be avoided, and sites fronting possible costly new streets should also be looked on with disfavour. He quite agreed. If they were going to house their workmen in cottages they must get away from the old crystallised idea that it must be in a wide street. He was in favour of wide streets—he would like to see the main streets 140 ft. wide; but it was not necessary for streets for workmen's

cottage. Mr Macartney said it was not necessary to have the houses fronting to a wide road. He was glad to see that Mr Macartney had advocated this cheap method of laying out houses for workmen. If workmen's houses were to be built on the cottage type they must reduce the expenditure on huge, wide tracks of macadam. Give a man garden ground in front of his cottage, and he would cultivate it.

Mr. A. H. GOUDIE (Stirling) said there was one thing he wished to ask a question about. Mr. Ross Young seemed to make a great point about the cost of the semi-detached cottage being much less than the tenement house, but it was possibly a very much smaller house than the tenement house. The cost of the tenement house, one room and kitchen, was given as £315, against the cost of the four-room cottage, £220. The tenement was described as substantially built, with dressed-stone front, tiled close, good fittings, and ceilings of over 10ft. It was very unusual to build tenements with ceilings of over 10 ft. high. That must have increased the cost to some extent. At the same time, £315 seemed very high for a house of one room and kitchen. Supposing they had a tenement with six one-roomed houses, the cost of the tenement would be £1,890. That seemed to him a very extraordinary price, and he would be pleased to have some further explanation. The question that had been discussed by some members of doing away with the tenement altogether, and going in for semi-detached cottages, might answer so far as the counties were concerned and some of the small towns, but in some of their very old towns, such as Stirling, it was impossible. They had a slum area in the centre of the town which they had had to purchase, and would rebuild as soon as the value of money dropped a little. In that area, in the middle of the town, they were doing their best to give good, healthy houses, but it would not be suitable to build cottages in such a case as that. They must recognise that in some cases tenements must go on, and the question which they had to decide was whether they could build houses as cheaply in a tenement as in a semi-detached cottage, and he held it was quite possible.

Mr J. LEE (Dundee) said he would like to have exact figures as to the cost of these four-story tenements. The tenement with eight houses of one room and kitchen at £315 came out at £2,520. The tenement with four houses of two rooms and kitchen, at £435, came out at £1,740. Thus, two tenements cost £4,260. Was that right?

Mr. MACARTNEY: That is right.

Mr LEE: He must have been a philanthropist who built it.

Councillor SMITH (Coatbridge) said he felt that in municipal housing the county and borough engineers had yet something to learn. He did not think they had much experience in the building of houses. (Cries of "Question.") They had a committee in the burgh of Coatbridge considering this question, and therefore he would like to get some light upon it. They were busy displacing a good many people from houses which were not in a proper condition, and he feared if they were put into new houses they would, in many cases, soon make them in the same condition. It was not only the houses, but the tenants were at fault. He thought it should be possible to let the new houses to those who were now in decent property, and thus lift all the people a little higher in their housing conditions. They had got to educate people how to use a decent house. There must be something wrong with the figures as to the cost of the tenement house. It was given for four houses of two rooms and kitchen as £1,740. He was prepared to give them a guarantee that he would do the work for £850. He thought in many respects the English had brought their building regulations down too low, and if they in Scotland copied them they would get out of the frying-pan into the fire, and have houses which would not last very long.

Bailie AGNEW (Coatbridge) regretted that Councillor Smith had made observations which he could not possibly accept. He thought the municipal engineers were to be congratulated on these two papers dealing with town planning and housing, considered particularly from the Scottish standpoint. He was especially pleased to hear Mr. Bryce express himself strongly with regard to the amount of propaganda work that had been done in Scotland by English enthusiasts. He had nothing to say with regard to the education they might receive in housing questions; but he did believe that in Scotland, notwithstanding the fact that they might be slow in the matter, it was better in the long run that they should solve their own problem on the lines and in the way that experience in Scottish districts would lead them along. It was better that they should learn by their own experience than follow English lines. He thought the municipal engineers might be influenced to establish a conference to include in greater measure than in past years papers on the subject of town planning and housing, so that they might have papers dealing with the question from Scottish experience and Scottish ideals emanating from them. That would be a great advantage to the representatives who would be influenced, to a large extent, by their technical officials. He wanted to say, as to tenements versus cottage dwellings, that they were not prepared to adopt in Scotland a system of cottage dwellings. What they had to take into consideration was that the conditions prevailing in Glasgow were not the same as prevailed in the smaller provincial towns. Mr. Bryce had knocked a story off his four-story dwellings, and they in Coatbridge would be prepared to knock off another story. What he would be inclined to do was to reform the tenement, so that it could express itself in a way other than in a long row of dwellings in a street which was drab and uninteresting. Instead of continuing these tenements in a long row, he thought it was possible, by breaking them up into a small number of buildings, to allow the tenement system to express itself in a variety of ways, and so solve the problem without plunging into the English system. One thing he did think they should not subscribe to, otherwise, if they did, all the work they might do would have the stamp of failure on it; if they believed there was any large section of the people who were unworthy to be properly housed, then their business was not to discuss housing questions at all, but to leave them as they were. He wanted to make that point because he could not subscribe to the statement that there was any large section of the people who were not worthy of any effort to solve the question of housing. He believed the municipalities, in solving this question of housing, would solve a problem which would give them and the people the greatest satisfaction.

Mr J. BARKER (Dumfries) said the action proposed was not sufficiently strong, considering the urgency of the case. He thought that the housing of the working classes would fall entirely into the hands of the municipal authorities. There was a general complaint of the lack of enterprise by builders to put up houses, and he was not surprised, because houses were not a profitable investment. He knew of a case in which a tenant went into a new house, and on leaving after three months over 300 nail holes were found in the walls, which had caused considerable damage. With regard to municipalities which undertook building schemes, he contended that they should build to the standard which they insisted upon in the case of private builders. Then one principle which should always be observed was that the building schemes should be self-supporting, and not be a charge upon the rates. Unless that principle was strictly observed he thought it was hopeless to expect that any municipal housing scheme would ever be satisfactory. In Dumfries they started a scheme two years ago to build forty-eight houses, at a cost of £150 each. Their building had cost them 4½d. per cubic foot. They were let at a rental which would meet the interest on and repayment of loans, and there had been no difficulty in letting. The housing of the working classes in Scotland was of a most unsatisfactory character, and one of the chief duties of a municipal engineer in future would be to design workmen's dwellings. If it was put in the hands of the members of that institution they might hope for quite good results.

Mr. R. LINDSAY (Edinburgh) said in his view there was something wanting with regard to town planning and housing. What they wanted to do in the first place was to fix a standard by which they could regulate the type of house that was wanted. That done, one half of their difficulty would be solved.

Provost LANG (Johnstone) said he was particularly pleased to know that the suggestion he threw out to Mr. Macartney had been discussed in the paper. The question arose in an uncommon way. As chairman of the Belgian Refugees' Committee at Johnstone, he found that they could not take as many refugees as they wanted. At present there were no houses to let. During the past year a very considerable development in industrial works had taken place, and a large number of workmen could be taken on if there were housing accommodation. Being interested in works in which 1,000 men were employed, he sug-

gested to one or two of the foremen in the different departments that they might find out the feeling of the men as to whether they preferred to live in tenements or cottage property. The foremen were more than surprised to finn that cottage property was very popular.

Mr. R. S. Macmillan (Clydebank) stated that in his burgh they had in hand a scheme of the two-story type of dwelling, four to eight houses in one block. These houses were quite distinct from the tenements.

Mr. J. Weekes (Irvine), describing some houses which he had recently visited, stated that the kitchen, which was about 12 ft. in width, had no fewer than four doors, while there was a window on one side and a fireplace on another. What he wanted to know was where a place was to be found for a bed, for, as they knew, the Scottish workman liked his recess bed. Mr. Weekes concluded with some observations of the English practice of placing the water-closet of houses off the scullery.

Mr. Macmillan remarked that two cottages built from one of the *Country Life* competition designs were to be seen at Clydebank. These had been most successful, and in those cases the water-closet was off the scullery.

The President (Mr. J. S. Pickering) said their thanks were due to Mr. Macartney for having contributed so valuable a paper to the "Proceedings" of the institution. The discussion would be most profitable to them all. His view was that the question would have to be settled by each individual district. Conditions which applied to one did not apply to another, and one had to be guarded about adopting general rules.

Mr. Macartney agreed with the president that the subject was one which had to be settled by each community and district. There were all sorts of varying conditions which came into play, and which had to be considered. He did not think he would say anything about the discussion. Some of the matters referred to had not been dealt with in the paper, but two members, Mr. Goudie and Mr. Lee, spoke of the question of cost. He could assure Mr. Lee the figures he had given in the paper were quite correct, for he obtained them from the man who paid for the property—who ought to know. Without giving any particulars as to the locality in which they were designed, he would say that he thought the property was badly designed. The ceilings were 10 ft. 3 in. and 10 ft. 6 in. high, and the planning had to be done carefully for the work to be carried out at all economically. Fittings took up a great deal of space. The cubic contents were tremendous, and yet there was nothing to show for it. That was the reason for the high cost. He had thought the information would show them what not to do. They learned more from failures than successes, and it would be a warning for them in the future.

LUNCHEON.

The members were on Friday afternoon the guests of the County Council at luncheon, the convener of the county, Councillor W. D. Russell, presiding over the gathering.

In welcoming the institution, the Chairman said his only wish was that the visit could have taken place under different circumstances—when peace and goodwill prevailed among the nations. Proceeding to refer to road matters, he remarked that in Ayrshire they had to contend with very varying conditions as to subsoil, climate and rainfall. In that particular area the subsoil was particularly good, and the rainfall was not exceptional. In other parts, however, they had to deal with clayey and peaty subsoils and double the rainfall. At the same time he was bound to say their road surveyors were a most capable and energetic set of men. All they desired to do, and did do, was to carry through their work in the most efficient manner and provide the best roads they could. The manner in which they performed their duties was very much appreciated, and he had much pleasure in saying so. In Ayrshire they had a very large amount of heavy motor-traffic over their roads, and he hoped that means might be found by which those who were responsible for that traffic would be made in the future to contribute justly and fairly to the upkeep of the roads they destroyed. He thought those present would agree that they did not get grants to the extent they should do from the Road Board in London. When such grants were given they were so fenced round with restrictions and stipulations that he thought steps ought to be taken to press for easier conditions. He thought they might, at any rate, be treated as honest men, and be allowed to spend money as they thought best for their various districts. That, he was sure, would make for smoother working.

The President (Mr. J. S. Pickering), in returning thanks, observed that the programme before them was a proof of the enthusiasm of the Scottish members. The several papers were of the greatest interest and importance to public authorities, and he had no doubt in his mind as to the wisdom of councils giving every encouragement to their officials to attend such meetings. No municipal or county engineer could possibly do his duty to his authority unless he made himself familiar with the works that were being carried out by his confrères in other parts of the country, and it was with the object of acquiring information of a useful character that their institution existed. He regarded the reception which had been accorded them that day as an indication of the sympathy of their hosts with the objects they had in view, and he was sure they would all look back on their visit with the pleasantest of recollections.

The annual dinner of the Scottish District was held in the evening at the Station Hotel.

(To be continued.)

EASTERN DISTRICT MEETING AT SOUTHALL.

The members of the Eastern District met at Southall on Saturday last, and were received in the town hall on behalf of the Southall-Norwood Urban District Council by the chairman, Mr. James Culley. After the formal proceedings a brief business meeting was held, and subsequently visits were paid to the open-air bath and the sewage disposal works, the meeting concluding with the discussion of papers by Mr. Reginald Brown, the engineer and surveyor to the urban district council ("Fourteen Years' Municipal Work in a London Suburb") and Mr. J. H. Edmondson ("Fitting Up and Working of a Sewage Works Laboratory"). The attendance included Messrs. H. T. Wakelam (Middlesex County), district chairman, J. A. Webb (Hendon Rural District Council), hon. district secretary, W. Gornall (Hendon Rural District Council), W. H. Taylor (Aylesbury), W. R. Locke (Hemel Hempstead), S. F. Dunbar (Hemel Hempstead), J. W. D. Needham (Hemel Hempstead), M. Hainsworth (Teddington), S. H. Chambers (Hampton), T. D. Smith (Kettering), W. B. Chancellor (Barnet), H. E. Ames (Barnet), C. G. Hall (Metropolitan Water Board), W. L. Carr (Ruislip-Northwood), D. C. Fidler (Hayes), J. W. Harrison (Uxbridge Rural), P. Harrison (Middleton, Lancs), S. W. Barnes (Hanwell), E. Willis (Chiswick), R. R. Hogoden (Southall-Norwood), J. B. Thomson (Southall-Norwood), R. Brown (Southall-Norwood), R. L. Honey (Chatham), H. F. Wilkinson (Tottenham), E. Seabrook (Hendon Rural), P. T. Harrison (Chelmsford), S. F. R. Carter (Beddington and Wallington), J. G. Carey (Heston and Isleworth), J. B. Bond, H. Knight (Brentford), Reginald Brown (Southall-Norwood), and J. H. Edmondson.

We report herewith the business meeting and discussion. Of the two papers we reproduce this week that of Mr. Edmondson, reserving Mr. Brown's paper for a future issue.

Mr. James Culley (the chairman of the Southall-Norwood Urban District Council) welcomed the members of the institution to Southall, and made brief reference to some of the municipal undertakings carried out by the council. These included open spaces and an underground convenience, which were a credit to Mr. Reginald Brown, the surveyor. The sewage disposal system also, he thought they would agree, was a fine piece of workmanship. It had been carried out in spite of the fact that the district had a low rateable value, but it could not have been accomplished if there had not been good co-operation between the council, [illegible] officers. The [illegible] scheme, which was in abeyance, had entailed a great deal of work upon Mr. [illegible], and they hoped it would [illegible] of its kind in the country.

The chairman of the Eastern District, Mr. H. T. Wakelam (county engineer of Middlesex), then took the chair which was vacated by Mr. Culley, and on behalf of the members moved a vote of thanks to that gentleman, which was seconded by Mr. E. Willis (Chiswick), and carried with acclamation.

Mr. J. A. Webb (hon district secretary) then read

the minutes of the previous meeting, which were duly confirmed.

Mr. WAKELAM referred to the election of Mr. Webb as representative of the Eastern District, and moved a vote of thanks to him for his services in the past. Mr. Webb [illegible] had won him the esteem of all the members of the district. They [illegible] he would continue to render them valuable service.

Mr. WILLIS seconded, and remarked that, thanks to the [illegible] courteous disposition, Mr. Webb had been able to discharge his difficult duties without the slightest complaint.

The vote was passed with unanimity, and Mr. Webb, in acknowledgment, said he hoped to continue to be of service to them, and that his duties would permit him to attend with regularity the meetings of the council.

Mr. WAKELAM, in formally moving a vote of thanks to Mr. Reginald Brown for his paper, announced that he would not be able to be with the members all day, as he had to visit another part of the county. He [illegible]

MR. REGINALD BROWN, M.INST.C.E.,
Engineer and Surveyor to the Southall Urban District Council.

for many years as one who had aptitude in his profession, and great qualifications for carrying out his duties. He did not think they could improve upon Mr. Brown's record in so far as his work in connection with the [illegible] was concerned, and it was very pleasant to find that the relations between the members of the Southall-Norwood Urban District Council and the officials were so satisfactory. With regard to heavy motors on traffic roads, there was, as they were aware, a Departmental Committee sitting. He (Mr. Wakelam) had given evidence before it on behalf of the County Councils Association and the council of the Institution of Municipal and County Engineers, and from what he had been able to gather there would be some alterations and improvements effected in respect of the diameter of wheels and the width of tyres. The vote of thanks which he proposed would be seconded by some speaker in the discussion after the members had returned from visiting the open-air swimming bath and the sewage disposal works.

After the visitation the members were served with tea, kindly provided by Mr. Brown, and upon reassembling in the council chamber Mr. E. Willis was voted to the chair.

Mr. WILLIS seconded the vote of thanks to Mr. Brown, and took the opportunity of thanking the members of the Eastern District for having elected him to the council for the forthcoming year. He also proposed a vote of thanks to Mr. J. H. Edmondson for his paper, which was seconded by Mr. P. T. Harrison (Chelmsford), and agreed to.

Mr. S. H. CHAMBERS (Hampton) remarked that at Southall they had a complex sewage problem to deal with, and Mr. Brown seemed to have tackled it in the right manner by going to the root, and thereby obtaining wonderful results. The effluent they saw was very good. Some of them did not turn out such good effluents, and he was really surprised at the small amount of suspended matter. Of course, they accepted Mr. Brown's figures, and also his conclusions. He was also interested in the open-air swimming bath, which must be an acquisition to such a district, and of which Mr. Brown had made a very good job. He did not know anything about the facts of the case, but the cost of the bath (£1,500) appeared to be really high. Probably there were reasons; but he noticed many little things which he (Mr. Chambers) could not afford which Mr. Brown had put in. Probably the water supply connections were rather expensive. It would be interesting to know why it had been considered necessary to have waterproof sheeting. With regard to the housing scheme, they had not seen it in a mature condition, and he should therefore leave any remarks he might have to make to a future occasion.

Mr. S. W. J. BARNES (Hanwell) said he had always found Mr. Brown a good neighbour, and as to his schemes, they bore the impress of a man who went thoroughly into his work and carried it out top hole. On the subject of the removal of house refuse, he (Mr. Barnes) found this a very expensive thing in his district, and he was not able to do the work at the figure quoted by Mr. Brown. Perhaps Mr. Brown would tell them the distance he had to cart his refuse, whether the collection was weekly, whether there was an understanding that the bins should be carried out to the front of the house, or whether the men had to carry them to the front of the house.

Mr. W. B. CHANCELLOR (Barnet) observed that, with regard to the filters, he had had the opportunity of asking Mr. Brown one or two questions, but he omitted to ask whether he had pooling, or whether there was any disintegration of the filtering media. It was possible to get better results from filters filled with large media than with small. A fine gauge gave better results in the initial stages, but it was costly, and necessitated cleaning and renewing. Judging from the analysis of the sewage, it was not a very strong one. Had Mr. Brown ever tried treating it on purely septic lines? He had tried both, and he was convinced it was infinitely better with septic treatment than with chemical precipitation. He congratulated Mr. Brown on having induced his council to engage a chemist. There were some of them who were not so fortunate. He would like to ask Mr. Brown why he made up private streets with Kentish flints and the subsidiary streets with tar-macadam. It would, he thought, have been better to have the private streets made up originally with tar-macadam. The owners would not object to spending a few pence per foot more. Then, again, did Mr. Brown prefer slag-macadam to granite-macadam? Also, what was the depth of hardcore in private streets? He thought the Southall Council were particularly generous in supplying the householders with galvanised dustbins. He noticed that Mr. Brown did tar-spraying for a halfpenny per square yard. Did that include chippings? As to the housing scheme, was it intended to be self-supporting?

Mr. T. R. SMITH (Kettering) asked questions with respect to the system of sewerage and the filling of the filter-beds. With respect to the latter, he wished to know what percentage of material Mr. Brown found useful, and whether the clinker turned out satisfactory. As regarded sludge, Mr. Brown was to be congratulated upon having a market for it which was rising. At Kettering they introduced the septic system, and found that they had to deal with about half the quantity of [illegible] they had before. As regarded the highways, he might say that at Kettering they dropped oil tar and took to tar-spraying, though he was bound to say he was pleased with oil tar, as it gave a more cheerful appearance to the roads than tar-spraying.

Mr. M. HAINSWORTH (Teddington) inquired if Mr. Brown found any nuisance arising from flies or smell in connection with the percolating filters. He thought Mr. Brown's figures with respect to the cost of private streets were remarkably small. He could not do the work anything like so cheaply. Was the kerb found by the owner when the streets were laid out? As to refuse disposal, he agreed with Mr. Brown as to the provision of dustbins. When all kinds of receptacles were in use the work was not facilitated. With regard to the open-air baths, he thought they were on a par with all the work they had seen at Southall, and as to the cost, doubtless Mr. Brown would have some explanation to offer. The difficulty he (Mr. Hainsworth) had was to find a site for an underground convenience, and the fact that at Southall they con-

structed the convenience under the town hall showed the character of the council and engineer in dealing with a problem which was always a difficult one.

Mr. P. T. Harrison (Chelmsford) asked, with regard to storm water, whether any attempt was made to purify the first washing. With respect to refuse collection, he noticed that two men went with the carts. Time was lost by the method of having two men, because they had both to go to the tip, or else one went to the tip while the other did—well, he did not know what. He congratulated Mr. Brown upon the site and lay-out of the housing scheme, and he should say that it promised to be a success. Reverting to refuse removal, he feared there would be a loss of time unless something was done to bring the receptacles to the front. He had nothing but praise for the sewage works. He did not know whether it was feasible to extract a large amount of fat that found its way to sewage works. He believed it was done in the North. At Chelmsford, he might say, with respect to air raids, that they had formed an auxiliary brigade of fifteen men, with dark uniforms, whom they insured against accidents, and though they hoped their services would not be required, they were doing what they could to provide for emergencies. He congratulated Mr. Brown upon the relationship subsisting between his council and the officals, for it showed that they worked together for the welfare of the district. He had known cases—not at Chelmsford—where it was not so.

The Vice-chairman of the Barnet Council inquired if the Southall Council obtained a loan for the sprinklers or if they paid for them out of the rates. As regarded road sweepings, were these carted to any point, or were they offered to the ratepayers? He must say that the Southall Council seemed to support the efforts of their engineer very well.

The Chairman (Mr. Willis) referred to the rapid increase of the population of Southall, and also to the fact that property of the working-class type was, unfortunately, responsible for a large education rate. The council, however, had the foresight to acquire open spaces, and by town planning endeavoured to anticipate the wants of the district in the future. He congratulated the district upon a low death-rate of 8·8 per 1,000 for last year. In pointing out that the success gained was largely due to attention to small details, the chairman said he wanted the younger members—and he spoke, for the moment, as one of the examiners of the institution—to give attention to details. The lack of this was the cause of the failure of most students in the past. He had had a large experience of sewage purification at Willesden, and he might say that before the sewage of that district was turned into the London County Council system they turned the precipitation tanks into open sedimentation tanks wih excellent results. The difficulties were great. On one occasion, in the summer, he found the effluent was actually six times the volume of the river. As regarded the size of the clinker, he endorsed the statement of Mr. Chancellor, that the larger clinker gave better results, even in contact beds. At Willesden they had a combined system, and at Chiswick they had lately carried out a separate system. The difficulty was to get separate houses provided with separate drains. It could not be enforced, and all they could do, where the drainage was to be relaid, was to use persuasive powers. The law, however, would have to enforce it. With respect to dust-bins, it was difficult to institute the system in the larger districts owing to the cost. In his district the estimate of cost was £2,500, and the council could not see their way to do it, as they would only get a loan for a year or two. At Chiswick their refuse collection was by day work and contract labour, the council supplying the horses and finding the usual equipment. They found this system much cheaper than the other system, and he did not think there were more complaints than under the old system. He congratulated Mr. Brown upon his sewage charts because it was possible to see from them the variations in the quality of the sewage and the percentage of purification from year to year. He would like to ask how Mr. Brown governed the period of changing the water in the bath. An analysis of the samples of water pointed to the advantages of an open-air bath over a closed bath. In connection with private street work, he should be glad if Mr. Brown would give them the method of construction. At Chiswick they had used flints, and tar and granite macadam, according to the foundation. They had power to have a foundation of 21 in., but in practice they were generally satisfied with 18 in. They also made a practice of tar-paving in private streets, whether of flint, granite, or tar-macadam, the cost being chargeable to the owners. With regard to the dock, he regarded it as a most useful acquisition to a local authority which adjoined a canal or river. Had Mr. Brown any special provision for unloading? And, if so, what were the charges? In the matter of road sweepings, he might say that at Chiswick they made a practice of selling them to ratepayers who wanted them at a fixed charge of 1s. 6d. per load. They made the stipulation that the money should be prepaid. It was no benefit or saving to the council, but a slight benefit to the ratepayer. He would sound a note of warning with regard to road sweepings—viz., that the sweepings of tar-surface roads were not to be desired.

Mr. Reginald Brown, in reply to the discussion, said, with respect to the open-air bath, that he was one of those who believed that, unless special precautions were taken, contract work did not yield satisfactory results. So far as the waterproofing was concerned, it seemed to him only reasonable that you should construct your bath so as to waste as little water as possible, or none at all. He did not think that one drop of water was lost out of the bath, and he had always seen the water at the same level. On the question of the removal of house refuse, he agreed that the method adopted at Southall was probably the most economical that could be adopted, though he was not going to say it was the best or most sanitary one. They provided the ratepayers with a dustbin, saw that it was emptied every week, dusted it with carbolic powder, placed the refuse in a sanitary dust-cart, and tipped it in somebody's back garden. Immediately on the boundary of the district there was a large brickfield whose owners would take all the refuse they could get. The council provided the cart and one man, and the contractor supplied the horse, harness, and one man. He agreed that the cost of cartage was a serious item. Half the time of the man was occupied in going to and from the shoot, and this was serious. Somebody asked what the other man did. He (Mr. Brown) took care he did something useful, because while one man was engaged in collecting the other was engaged in sweeping the street. The cost was really the first cost. They used to have filthy ashpits in the district, and the council thought it would be better to take the bull by the horns and purchase the dustbins, whose average life was ten years. As to pooling on the surface of the filters, this occurred in one or two instances, and it was due solely to the action of the men. They never saw any disintegration of the filtering media. The media, he might state, consisted of medium-sized clinker. It was better that sewage should pass over clinker in a fine stream than a thick stream. He was pleased to hear the remarks made in approval of the council engaging a chemist. With respect to private streets, he thought the cost of construction fairly reasonable. He was told they spent far too much money on private streets. Up to the present they had never, or only once, made up private streets under the new by-laws of the council. Now they required that a granite-block channel as well as kerb should be put in for private streets. The streets referred to in the paper were constructed under the old by-laws, which required a kerb only. That worked out at from 6s. to 10s. per foot where no channel is provided, and 7s. 6d. per foot-run when channel was provided. It was asked why not use tar-macadam for private streets. The only answer to that was that, before they called upon owners to make roads in a particular way, the council should set an example themselves if they did not wish to have complaints. He thought they could make private streets with tar-macadam quite as cheaply as with flint and granite. He might say that they had some magnificent local flint within a few miles of the district. They had an entirely separate system of sewers. They provided the main sewer, and every person who built had to provide two sets of drains, and they allowed twelve houses to go into one drain. They might say this was a dangerous thing to do, but they had done it for twenty years, and it had probably cost something like £2 for the maintenance of the sewers. He thought he was right in saying that not more than 5 per cent of the clinker taken out of the beds was wasted, the remainder being sludge. He had purchased his clinker media at 3s. 4½d. per cubic yard. The sludge difficulty was difficult to solve, but he believed further experiments would prove that, in the case of particular lands which were deficient in lime, the application of sewage sludge would make them more valuable, especially grass lands. The oil tar at a halfpenny per yard

not used with cinders, except to make thoroughfares. It used to cost a farthing, but the cost of it had increased. As to the housing scheme, he might say that he was intended to be self-supporting—that was with him a fundamental principle. The roads could not be carried unless there were to be the cottages. Land was purchased at £100 an acre, and the scheme was only possible by reason of the admirable site, and the fact that there would be very little road construction. They were utilising existing roads, and getting the back land for open spaces, which, he thought, every landowner ought to provide. They had no nuisance, or very little, from the sewage works. Flies they did get, but the works were so constituted that they had no trouble with them. The sprinklers, he might add, were obtained by means of a loan. As to road sweepings, if there was no call for them from the ratepayers they were carted to the depots. If a ratepayer required them from the depot a charge of 2s. per load was made for carting. There was no special provision for unloading at the depot. They hoped to have a destructor at the dock, and there would be cranes for loading and unloading barges.

Mr. EDMONDSON, who received a vote of thanks for his paper, gave a brief address, and the proceedings closed.

COUNCIL MEETING.

A meeting of the council of the institution was held at 92 Victoria-street, Westminster, on Saturday, May 29th, those present being Messrs. J. S. Pickering (president, in the chair), J. Patten Barber, W. N. Blair, J. A. Brodie, J. S. Brodie, G. F. Carter, A. E. Collins, E. J. Elford, W. Harpur, T. W. A. Hayward, W. T. Lancashire, Sir James Lemon, P. H. Palmer, Norman Scorgie, H. T. Wakelam, C. F. Wike, O. E. Winter, the consultant secretary, and the secretary.

THE MEMBERSHIP ROLL.

The following candidates were elected:—

Members: Messrs. J. Bowen, borough engineer and surveyor, Reading; J. Cullen, water engineer, Eastern District, Stirlingshire; J. K. Frazer, burgh surveyor, Airdrie; E. A. Green, chief building surveyor, Sheffield Corporation; E. J. Hamlin, town engineer, Stellenbosch, Cape Colony; H. Hudson, engineer and surveyor, Chesterfield Rural District Council; J. W. Jones, deputy borough engineer and surveyor, Lyme Regis; J. Lang, county road surveyor, Kilmarnock District of Ayrshire; R. McDonald, road surveyor, Ayr County, Northern Division; J. F. McGahon, surveyor for Carrickmacross Urban and Rural District Councils; A. J. Mildon, surveyor to the Tiverton Rural District Council; F. T. Negus, deputy city engineer and surveyor, St. Albans; A. Simpson, burgh surveyor, Troon; and W. Starkie, surveyor to the Welton Rural District Council.

Associate-members: Messrs. R. C. Muir, second assistant engineer, Office of Public Roads and Highways, Province of Ontario, Toronto; and G. W. Spurring, assistant borough surveyor, Harwich.

Students: Messrs. B. F. Holness, engineering assistant to the Watford Urban District Council; M. W. Lashmar, surveyor's office, Cowes Urban District Council, Isle of Wight; G. Nayler, city surveyor's office, Hereford; and L. O. Wilkes, town surveyor's office, Redditch.

Transfer from Associate-member to Member: Mr. J. H. Castle, engineer and surveyor to the Goole Urban District Council.

LETTERS OF CONDOLENCE.

It was resolved to express the sympathy of the council with the families of the late Messrs. W. A. Collins, J. Rush Dixon, T. B. Farrington, R. Hara, and M. H. Sykes.

AWARD OF PREMIUMS, 1914-1915.

It was resolved to award premiums of three guineas each to Mr. W. B. Acton, for his paper on "Tropical Hill Roads"; Mr. E. H. Collcutt, for his paper on "Bituminous Carpeting Plant"; Mr. W. J. Goodwin, for his paper on "Some Notes on the Municipal Works of Salisbury"; Mr. A. S. Parsons, for his paper on "Recent Highway Bridges in Birmingham."

BADGE FOR VICE-PRESIDENTS.

A suggestion received from the Scottish District for the provision of a badge for vice-presidents was considered, and it was resolved that vice-presidents should be presented with a certificate similar to the President's Certificate, with the necessary alterations in wording.

NATIONAL ROAD CONFERENCE AND EXHIBITION.

It was resolved to appoint Messrs. J. S. Brodie, P. H. Palmer, R. J. Thomas, H. T. Wakelam, C. F. Wike, and O. E. Winter to represent the institution at the conference.

EXAMINERS' REPORT.

The Acting Examiners' Report on the examination held on April 22, 23 and 24, 1915, was received, and it was resolved to award the testamur of the institution to the following: Messrs. T. F. Allen, M. A. Asrani, J. A. H. Burford, H. Cliffe, P. I. Davies, C. E. Evans, J. S. Featherstone, P. Harrison, H. N. Letherby, W. Melville, N. J. Modi, G. F. Norris, H. Nurse, T. L. Parkes, J. A. Riccomini, J. Turrill, W. H. Veal and W. A. Walker.

DEPARTMENTAL COMMITTEE ON HEAVY TRAFFIC.

The secretary reported that Mr. Frank Harris had been co-opted as a witness to give evidence to the Departmental Committee on behalf of the institution.

MUNICIPAL ENGINEERING APPOINTMENTS DURING THE WAR.

The secretary reported that, as a result of the representations made by the council, the Local Government Boards of England and Ireland had issued circulars drawing the attention of local authorities to the desirability of safeguarding the promotion and advancement of officials on active service.

NATIONAL ROAD CONFERENCE AND EXHIBITION, 1915.

PROGRAMME.

The following is the arrangements for the forthcoming Road Conference and Road Exhibition in London organised by the County Councils Association:—

Friday, June 25th.

4 p.m.—Official opening of the exhibition at the Royal Horticultural Hall, Vincent-square, S.W., by the Right Hon. Walter Long, M.P., President of the Local Government Board.—Chairman, The Right Hon. Henry Hobhouse.

Monday, June 28th.

2.30 p.m.—Conference on "The Use of Tar, Pitch and Bitumen in the Construction and Maintenance of Roads, with special reference to the subject of Corrugations." Papers by Mr. Percy J. Sheldon, M.INST.C.E., county surveyor, and Mr. Alfred J. Lyddon, ASSOC.M. INST.C.E., deputy county surveyor, of Essex, and by Mr. G. H. Jack, county surveyor of Herefordshire.—Chairman, The Mayor of Westminster.

Tuesday, June 29th.

2.30 p.m.—Conference on "Heavy Traffic." Papers by Mr. Harcourt E. Clare, clerk of the Lancashire County Council, and Mr. Ernest J. Elford, M.INST.C.E., M.I.MECH.E., borough engineer and surveyor of Southend-on-Sea.—Chairman, Colonel G. Dixon.

Wednesday, June 30th.

2.30 p.m.—Conference on "The Classification of Roads." Paper by Mr. G. Montagu Harris, M.A., Barrister-at-law, secretary to the County Councils Association.—Chairman, Sir W. Ryland D. Adkins, M.P.

Thursday, July 1st.

2.30 p.m. Conference on "The Reconstruction of Roads in Belgium, with general reference to the injury done to roads by war operations and military traffic." Paper by M. Henri Vandervin, Ingenieur en Chef Directeur des Ponts et Chaussées de Belgique.—Chairman, His Excellency the Belgian Minister.

The conferences will be held in the Lecture Room at the Horticultural Hall, on the first floor.

The exhibition will be open every day from June 25th to July 1st inclusive (with the exception of Sunday), from 10 a.m. to 7 p.m.

Heavy Traffic.—A paper on the "Amendment of the Law and Regulations relating to Heavy Traffic on Highways" was read by Mr. Bromley Challenor at the annual meeting of the Rural District Councils Association on Wednesday, and a resolution was passed urging upon the Departmental Committee on Locomotives and Heavy Motor Cars (Damage to Roads) the necessity for such amendment as would prevent the serious damage to roads, and secure more effective control of the traffic.

Assistants' and Students' Section.

Conducted by SYDNEY G. TURNER, assoc.m.inst.c.e.

All communications in regard to this page must be addressed to The Editor, St. Bride's House, 24 Bride-lane, Fleet-street, E.C. *Envelopes must be marked "Assistants' Section" in the top left-hand corner. Correspondents are invited to submit questions for consideration and answers to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.*

QUESTIONS.

This week answers are invited to the following questions:—

483. Bridge Construction.—How are the lengths of the four wing walls of a bridge and the horizontal angle between the bridge and each wall determined? ("Tico.")

484. Hydrostatics.—A square sluice opening, 3 ft. by 3 ft., is formed in the vertical face of a dam, and the upper edge of the opening is 6 ft. below water. Calculate the hydrostatic pressure upon the square area, and find the exact position of its centre of action. (A.M.I.C.E.)

485. Building Construction.—A casement window-frame is to be fixed in a cavity wall (10-in. stone facing, an inner facing of bricks, and a 2-in. cavity). Show clearly the methods of fixing, and any important features with respect to the relation between the window-frame and the cavity. (Mercian.)

486. Sewage Ejectors.—How would you test the efficiency of a pair of 100-gallon alternating sewage ejectors with motor-driven air compressors? (C. A. B.)

487. Structures.—Find, graphically or analytically, the maximum deflection in a steel lattice girder of the N type, supported at each end, under a load of W tons applied on the bottom boom at a distance of 24 ft. from one support. Span of girder, 72 ft.; six 12-ft. bays; depth of girder 10 ft. Take safe intensity of stress in the members as 5 tons per square inch, and Young's modulus E=13,000 tons per square inch. There is no counter-bracing. Neglect the weight of the girder itself. (B. K., *Newport.*)

482. Water Towers.—What are the objects of water towers, and how did they originate? Is there any book dealing with this subject? ("Rewot.")

Water towers may be divided into two groups—viz., first, those which act as elevated service reservoirs; second, those which serve as balancing or break-pressure tanks in a long pipe line of inverted syphons. The intermittent system of water supply, which involves the use of storage cisterns in the houses of the consumers, has fallen into disfavour, and a constant supply to reach the highest houses in the district where the water is consumed at an adequate pressure is necessary in most waterworks. The consumption of water in a distributing system varies from hour to hour, and reaches a maximum between the hours of 8 a.m. and 5 p.m.; on the average, it is found that rather more than twice as much water is consumed between the hours of 6 a.m. and 6 p.m. than between 6 p.m. and 6 a.m. Now, one of the functions of the service reservoir is to provide a storage of water at sufficient elevation so that during the periods of maximum demand the supply is satisfactory at all places in the district. Referring to the pipe or pipes connecting the storage reservoir to the service reservoir as the "supply" main, and the pipe conveying the water from the service reservoir to distributing system as the "distributing" main, then in an efficient waterworks the supply main should be large enough (with an allowance for increase of population) to supply the average demand measured over a period of twenty-four hours, while the distributing main or mains, as the case may be, should be designed so as to convey the maximum demand. Obviously, the distributing main will, in general, be of larger capacity than the supply main, and in a waterworks system which has no service reservoir the supply main is also a distributing main—a not very economical arrangement if an efficient supply is required. The service reservoir also provides an emergency supply that can be drawn upon in case of a breakdown in the supply main. Occasionally no suitable site with sufficient elevation can be obtained for the service reservoir, and it then becomes necessary to raise the service reservoir by placing it on a structure built on the highest ground available, and thus originates the water tower. Service reservoirs usually are able to supply two ordinary days' demand, but, in order to reduce their cost, water towers contain about one-quarter of a day's demand, or even less. They are constructed in masonry and reinforced concrete, and, in America, of iron and steel. Elevated service reservoirs of this description may also serve as break-pressure or balancing reservoirs; in any case, they ensure a more or less steady pressure in the distributing mains, which is independent of any increase of pressure that might occur in the supply main from one cause or another. As regards the second group of water towers, let the figure No. 1 represent in outline a pipe line consisting of several inverted syphons. The storage reservoir is situated at A, the service reservoir at B, while the line AB represents the hydraulic gradient. The points C and D represent intermediate hill-tops on the line of pipes, the point C lying on the line of the hydraulic gradient, and the point D is assumed to be somewhat below it. A tank is constructed at C, where the working pressure in pipe will be zero. A water tower is built at D up to the hydraulic gradient, so that working pressure in this tank is also zero. After a little consideration it will be clear that the

[The Editor is at all times glad to hear from readers who desire to submit questions regarding matters of general interest, points of daily practice, &c., for insertion in the "Assistants' and Students' Section." Questions which are published are taken into consideration, as well as other matter, in awarding the Monthly Premium.]

REPLIES TO QUESTIONS.

480. Sewer Survey.—It is required to survey the course of an old brick sewer, 5 ft. diameter, which runs for 1,000 yds. in a very irregular line in a thickly populated district. There are no available manholes. How can this be done, and what instruments would be used? (W. S. W., *Chesterfield.*)

Mr. A. C. Turley, the borough engineer of Canterbury, writes:—

When acting as an assistant at Harrogate, I made a survey of an old sewer (which took a very tortuous course, and upon which there were very few openings from the surface) by means of a transit theodolite fixed on short legs. In some places the head room in this culvert was less than 3 ft. Practically I made a very careful traverse survey of the sewer, which was plotted to a scale of 16 ft. to an inch, and "fitted" at the terminals with wonderful accuracy. Two men assisted me; lighted candles were used at observation stations, a light being held over the centre of the sewer at each change of direction. To a man who knows how to use properly a theodolite I don't think I need say more. I [illegible] "W. S. W." be careful to have the ends of the sewer opened for an hour or so before he attempts to go through same, so that the foul gases may be got rid of. Should he require any further assistance I shall be pleased to give it if he will drop me a line.

The Surveyor
And Municipal and County Engineer.

pressure in the inverted syphon connecting C and D cannot be affected by any alteration in pressure in other sections of the pipe line, such as might occur from the stoppage of flow, and that it is economical arrangement, inasmuch that the pipes may be designed with only sufficient thickness to resist the known hydrostatic pressure. A main pipe line can with advantage be divided up into several sections by the construction of balancing reservoirs at suitable points, and, at those points where the site has not sufficient elevation, water towers would be built. An example of this kind is the Norton water tower on the Vyrnwy aqueduct of the Liverpool waterworks. The pipe line in this case has been divided into six syphons connected together by balancing reservoirs. Between Cotebrook balancing reservoir and the Prescot reservoir the ground does not rise anywhere up to the hydraulic gradient. The distance between Cotebrook and Prescot being too great a length for one syphon, a balancing reservoir was erected on the top of Norton Hill, the highest suitable intermediate point on the route. The reservoir consists of a cylindrical steel-plate tank, 80 ft. in diameter, supported by an elaborate masonry tower of beautiful design, with basin-shaped bottom containing a maximum depth of water of 31 ft. Towers of this type thus provide a valuable source of supply in the event of failure in the supply at some point higher up on the aqueduct. Valuable information with respect to water towers is given in Vernon-Harcourt's "Sanitary Engineering," McPherson's "Waterworks Distribution," "Proceedings of the Institution of Civil Engineers," vol. cxxvi., pp. 60 and 61. (M. T. R., *Blyth*.)

Income-tax on Sewers. In the House of Commons on Tuesday the Secretary to the Treasury was asked if the Commissioners of Income-tax were charging all municipalities in Scotland income-tax on the valuation of their sewers, while the same tax was not being exacted from many cities in England; if some cities were being asked to pay the tax for three years, others for two years, and others for only one year; and, if any of these inequalities were found to exist, if the Government would postpone the collection of this tax until it could be imposed upon all cities alike. Mr. Montagu, the Financial Secretary to the Treasury, stated that sewers which were rateable were also chargeable to income-tax, and that the practice throughout Great Britain conformed to that principle. Replying to a further question, he admitted that at the moment the tax was charged only on sewers in Scottish towns, the reason for this being that the sewers were only rateable in Scotland.

ARTERIAL ROADS IN GREATER LONDON.

NORTH-WESTERN SECTIONAL CONFERENCE.

In connection with the scheme for arterial roads in Greater London, a meeting of the North-Western Sectional Conference was held on Friday afternoon last at the Local Government Board offices, Mr. Regester (Middlesex County) occupying the chair. There were also present Messrs. W. E. Riley (superintending architect to the London County Council), S. B. Sandford (London County), C. Pinkham (Middlesex), G. A. Lansdown (Kensington), A. R. Finch (Kensington), O. Street (Acton), W. H. Mills (Brentford), J. W. Croxford (Brentford), E. E. Ryder (Bushey), E. Willis (Chiswick), R. Willey (Ealing), W. R. Hicks (Ealing), A. W. Perkin (Greenford), C. Hopton (Greenford) J. A. Smith (Harrow-on-the-Hill), D. C. Fidler (Hayes), S. S. Grimley (Hendon), J. J. Bennett (Heston and Isleworth), F. M. Elgood (Ruislip-Northwood), E. J. Garner (Uxbridge), J. Southam (Watford), D. Waterhouse (Watford), C. R. W. Chapman (Wembley), O. C. Robson (Willesden), E. Herbert (London Society), H. R. Aldridge (National Housing and Town Planning Conference), W. H. Thompson (Roads Improvement Association), S. D. Adshead (Royal Institute of British Architects), Colonel Hellard (London Traffic Branch Board of Trade), and G. L. Pepler (Local Government Board).

ROUTES APPROVED.

A recommendation of the sub-committee with regard to the construction of a north circular road through the North-Western Section, from Edgware-road, by Gunnersbury-lane, to a point in Chiswick High-street, where the Brentford by-pass road commences, was adopted, subject to a length between Dog-lane Bridge and Harrow-road being settled in detail.

In the discussion on the recommendation, Mr. Robson said he understood that the conference had taken the view that it should not deal with questions of cost, but, in his opinion, it was essential that these questions should be faced forthwith in order to facilitate negotiations in regard to town planning schemes. He would like to know who was going to pay for the extra width of the arterial road—100 ft. suggested—over the by-law road—50 ft. Also the committee had made an excellent suggestion of a garden between the new road and the river Brent, but did not say who was to pay for it. Again, railway bridges would have to be widened, and neither his council nor the railway companies would pay for that.

The chairman said he was in entire sympathy with Mr. Robson's remarks as to finance and the probable attitude of local authorities in the matter. Speaking as chairman of the Middlesex County Council, he did not think that they were, under present circumstances, any more likely to put their hands in their pockets. However, it was premature to raise the question now, except to make it clear that, in approving these routes, local authorities had not committed themselves to any expenditure. The matter could properly be raised at the main conference.

Recommendations dealing with the construction of what is known as the Sunbury extension and the Western avenue were afterwards approved.

It was decided that the sub-committee should be reappointed in order that they may consider the best means of carrying out the approved routes, and keep in touch with and encourage co-operation between local authorities and between the other sectional conferences with regard to road proposals and town planning schemes, and that for this purpose they should be empowered to elect a small special committee to form part of a committee of the whole conference, if similar small committees are nominated by the other sections.

It was also resolved that the Local Government Board should be asked to obtain preliminary estimates, as soon as possible, of the probable cost of the respective improvements, so that, *inter alia*, in the event of unemployment, following the war or otherwise, information as to a useful outlet for labour will be readily available.

BUILDING LINES.

The question of building lines was next discussed, on a recommendation that powers should be given to the London County Council, and any county council, after consultation with the local authority concerned, to prescribe these to existing main roads subject to an appeal to the Local Government Board.

Mr. Willis spoke in support of the recommendation, as he had been instrumental in getting it adopted

by the sub-committee. The Middlesex County Council already had authority on the lines of the recommendation, and in his view it was a desirable power for county councils to possess.

Replying to a question of Mr. Robson as to whether the intention of the recommendation was to take out of the hands of local authorities the powers they already possessed as to building lines and to put them in the hands of the county councils, the chairman pointed out that the intention was made clear by the recommendation.

Mr. Aldridge said he desired the conference to consider where the proposal led to. The intention of the recommendation was to try to get an improved building line without paying for the set-back. He had taken the opinion of an experienced parliamentarian who told him that the House of Commons would never assent to such a proposal. The question of compensation was bound to come up. The Town Planning Act did give power to deal with building lines without compensation, but only in regard to space about buildings.

Mr. Croxford said he thought the county councils should only have the right to deal with roads to the upkeep of which they contributed.

The recommendation was adopted.

CALLING OF MAIN CONFERENCE.

It was resolved that the date of the main conference should be fixed by the chairman of the sectional conferences in consultation with the Local Government Board.

ASSOCIATION OF CONSULTING ENGINEERS.

ANNUAL GENERAL MEETING IN LONDON.

The annual general meeting of the Association of Consulting Engineers was held at Caxton Hall, Westminster, on Monday, May 31st, Mr. G. Midgley Taylor presiding.

The hon. secretary (Mr. A. H. Dykes) having read the notice convening the meeting and the minutes of the last ordinary general meeting, which were confirmed,

The chairman moved the adoption of the report of the committee, and stated that the association had recently elected several prominent engineers to membership, and from what could be gathered by conversation with consulting engineers generally, the association was held in high esteem, and it was confidently anticipated that in the near future a large accession to the number of members would take place. It was evident that the association occupied a very strong position, and in course of time, when the usefulness of the association became better known, it was anticipated that it would include in its ranks not only the majority of the consulting engineers in Westminster, but also in the United Kingdom. It was somewhat difficult to convey to the consulting engineers in the country all the work being performed by the association, but a perusal of the report would indicate that much useful work had been done in the past year, and that the committee were active in furthering the interests of its members.

CONDITIONS OF CONTRACT.

One of the heaviest works undertaken by the committee was a consideration of the model general conditions of contract issued by the Institution of Electrical Engineers, and to which considerable objection had been taken. It was felt that general conditions of contract should be applicable to contracts generally, and that works pertaining to the electrical branch of the profession should not require any special treatment. Accordingly the model general conditions put forward by the Institution of Electrical Engineers were compared with those generally adopted in other branches of engineering, and, as a consequence, serious objection was taken to some of the provisions of the model form. The objections were communicated to the Institution of Electrical Engineers, and the association were thanked for their views.

During the past year the Book of Professional Rules and Scale of Fees had been revised, and, judged by the number of applications received for the book, not only from members of the association, but from Government departments and the engineering profession generally, it had been found of great general utility.

The committee took every means in their power to maintain the best traditions of professional conduct, and in every case where advertisements appeared inviting engineers to send in applications and fees for carrying out engineering works, the committee communicated with the authority advertising, and stated that, by the rules of the association, its members were prevented from answering advertisements of the nature referred to. In one instance, an advertisement inserted by the Eastern Valleys (Monmouthshire) Joint Sewerage Board was dealt with by the association, and it is satisfactory to learn that the Institution of Civil Engineers also took this matter up, and issued a special circular on the subject, calling the attention of the members of the institution to the impropriety of engineers competing against one another in the manner described.

COMPETITIONS.

There were many matters which would engage the attention of the association during the coming year, among others being the question of whether it was proper for members of the association to enter into competitions for schemes for public authorities. The chairman stated that there was a divergence of opinion upon the subject, and it was probable the committee might decide to approach the Local Government Board and have the benefit of their views upon the subject. There was much to be said in favour of competitions to enable junior members of the professions to present schemes to local authorities, but the chairman stated his strong views that there was very much to be said against competitions as usually at present conducted, and the methods by which the successful competitor frequently obtained his work. It was thought, however, by certain members of the association that if competitions were conducted on proper lines there might be no objection raised by the association to its members entering for them, and the matter would be carefully considered and a report would be made to the members.

The chairman referred to the fact that, although membership of the association was confined to principals of firms, there were no fewer than five of its members serving with His Majesty's Forces. He viewed this as an extremely satisfactory condition of affairs.

The adoption of the report was seconded by Mr. W. J. E. Binnie, and carried unanimously.

The hon. treasurer, Mr. S. R. Lowcock, then presented his report, showing a balance in excess of expenditure of £64 16s., as compared with £13 4s. 8d. last year.

The adoption of the accounts was seconded by Mr. H. J. Rofe, and carried.

Four London and two country members of the committee having retired by rotation, the result of the ballot for the new members of the committee resulted as follows:

The four London members elected were—

Mr. W. Ll. Preece, M.INST.C.E., M.I.E.E.
Mr. W. J. E. Binnie, M.INST.C.E.
Mr. Ernest L. Mansergh, M.INST.C.E.
Mr. E. Brough Taylor, M.INST.C.E., M.I.MECH.E.

The country members elected were—

Mr. Walter Emmott, M.INST.C.E., M.I.E.E., Halifax.
Mr. F. W. Hodson, M.INST.C.E., Loughborough.

The chairman remarked that the committee would welcome the assistance of the new members, and he know they would do good work.

A long discussion then took place on matters of great importance to the profession, in which the chairman and Messrs. Binnie, Lowcock, Mordey and Campbell Swinton took part.

It is hoped to make a communication to the members with reference to these matters at a later date when they have further matured.

Votes of thanks to the hon. auditors, Messrs. Cash, Stone & Co., and the hon. solicitor, Mr. F. E. Wright, of Messrs. Faithfull & Owen, were then carried unanimously, and on the motion of the chairman the meeting closed with votes of thanks to the hon. secretary, Mr. Dykes, and the hon. treasurer, Mr. Lowcock, for their great services during the past year.

Russia and Birmingham Town Planning.—The town clerk, Mr. E. V. Hiley, has received a letter addressed to the Corporation of Birmingham from Mr. P. Migouef, librarian of the Technical Institute, Petrograd, requesting information respecting the town planning of Birmingham, and asking for documents generally dealing with the municipal work of the city. In reply the town clerk has forwarded to Mr. Migouef copies of the town planning literature and plans of the town-planned parts of the city.

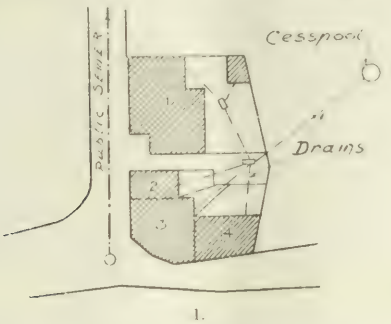
Law Notes.

The Editor will be pleased to answer any questions affecting the practice of engineers and surveyors to local authorities. Queries (which should be written legibly on foolscap paper, on one side only) should be addressed to The Editor, at the office of THE SURVEYOR, *accompanied by the writer's name and address, but correspondents who do not wish their names to be published should also furnish a "nom de plume." When necessary, a sketch of local features referred to should be provided. All explanatory diagrams must be drawn and lettered in* BLACK INK *only, and in such style as to be fit for direct reproduction (i.e., without re-drawing or amendment). Unless these conditions are complied with, we cannot undertake to reply by post.*

QUERIES AND REPLIES.

In order to avoid confusion querists are requested to use distinctive words as noms de plume. The letter X, combinations such as X.Y.Z., and words such as "engineer" and "surveyor," should not be used.

SEWER OR DRAIN—CLAIM AGAINST LOCAL AUTHORITY.—"Rural" writes: The premises (numbered 1, 2, 3 and 4 as indicated on the plan) are separately held, under the owners, and were formerly drained into a cesspool, as indicated on plan No. 1. They have recently been redrained and connected to the public sewer, as indicated on plan No. 2. The re-



1.

draining was done when it was proposed to utilise premises No. 1 as a war hospital, and the expense was met by a private individual, who was anxious to see the premises adapted as soon as possible. A claim is now made against my council for the whole of the cost of the work, the contention being that the whole drainage system constitutes a sewer. I shall

2.

be glad to have your opinion as to the extent of the council's liability. I may say that previous to the redraining it had been reported to the council that the then state of the drains constituted a nuisance, and it was proposed to take action against the owner to have the nuisance abated.

(1) Only that part of the drainage system which took (or takes) the drainage of more than one building was (or is) a "sewer." See definitions in sec. 4 of the Public Health Act, 1875. (2) We do not think that the cost of any of the work can be recovered from the council in the circumstances of this case, the work having been done quite voluntarily. See *Ellis* v. *Bromley Rural District Council* (1899), 63 J.P., 711.

"NOTICE IN WRITING."—"F.W." writes: (1) Referring to "E.M.'s" query [THE SURVEYOR, April 23rd, p. 546], am I right in assuming that your answer was directed to the point as to whether a rubber stamp might be used, and not to the question whether the wording of the notice was in order? (2) Further, will you kindly tell me if under this section a notice exactly similar to "E.M.'s" is sufficient, and can be [illegible] the approval [illegible] of the plan has to be approved, and if the person depositing the plan has not begun to build within three years the council has then to declare the plan null and void?

(1) Yes. (2) The section appears to contemplate two distinct notices: first, a notice of the provisions of the section, which must be attached to the approval and second, notice in writing of a declaration by the local authority that the deposit of the plans or sections is of no effect. The latter notice cannot be given until the event has happened upon which the declaration can be made—*i.e.*, until the expiration of the three years. We are very doubtful as to the sufficiency of the form used by F.M.

REPAIR OF APPROACH ROADS TO LEVEL CROSSINGS.—"Northbank" writes further: I thank you very much for your helpful reply to my query in reference to the above, and shall be glad if you will allow me further to trouble you. The approach roads referred to in my previous communication are inclined "approaches," of which there are a number in this district. The railway company concerned is relying upon some (recent?) decisions, which are said to have relieved the company of the liability to maintain these inclined "approaches." The case quoted is "the judgment in the House of Lords in the action between the Sharpness New Docks and Gloucester and Birmingham Navigation Company and the Corporation of Worcester," which is said to have upheld the judgment in the West Lancashire case. Can you inform me if this is so?

The case referred to is reported in (1915) 31 T.L.R., 254, and turned upon the construction of sec. 61 of the Worcester and Birmingham Canal Act, 1791. By that Act the company was empowered and directed to make bridges to carry certain highways over their canal, and sec. 61 provided that all such bridges should "from time to time be supported, maintained, and kept in sufficient repair by the company." The substantial question in the case was whether these words imposed any obligation on the company to reconstruct the bridges so as to make them capable of bearing modern heavy motor traffic, and it was held that they were not under this obligation, but were only liable to keep in repair the particular bridges, the size and strength of which were originally determined by commissioners appointed under the Act. It may be that the contention of the railway company in the present case is based upon increased traffic over the approaches, and we can only repeat what we said before that their liability may have to be determined by the provisions of the Special Act of Parliament under which the railway was constructed.

Rural District Councils Association.—Delegates from over 130 authorities were present at the annual meeting of the Rural District Councils Association, held on Wednesday at the City of London Guildhall. The report stated that the association now includes 155 rural district councils out of a total of 650.

Loans to Local Authorities.—On Wednesday, in the House of Commons, Mr. Montagu, Financial Secretary to the Treasury, stated that at the present time loans were only granted by the Public Works Loan Commissioners when it could be shown that their purpose was urgently necessary in the national interests for the furtherance of the war, or was of urgent necessity for reasons of public health. This arrangement had been made in pursuance of the Government's general policy of postponing or avoiding all new capital expenditure wherever possible. New loans were therefore only granted in respect of works for which a local authority was able to produce evidence of Treasury or Local Government Board approval granted since the special restrictions out of the needs of the war had been effective. In cases where loans had already been granted, but either had not yet been advanced or had been partly advanced, the Public Works Loans Commissioners required that all possible efforts must be made by the local authority concerned to postpone or delay expenditure in connection with the loan, and advances were not made out of the loan unless it could be shown that those efforts had been made. The total amount of new loans granted from April 1 to June 7, 1915, was £27,454, as compared with £809,649 during the corresponding period of 1914. The total amount advanced was £419,271, as compared with the £710,445 for the corresponding period of 1914. This amount represented, for the most part, advances in respect of loans which had been granted prior to the new restrictions.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of Surveyor readers with a view to making the information given under this head as complete and accurate as possible.

INQUIRIES HELD.

Colwyn Bay U.D.C. (June 3rd. Mr. W. O. E. Meade-King). £660 for the purchase of a high-level estate on the border of the district on which it is proposed to construct a surface reservoir.—This is to contain 11,000,000 gallons of water, sufficient to meet the requirements of the district in the event of any fracture of the main until the repairs are effected. Mr. J. H. Roberts, deputy clerk, and Mr. W. Jones, engineer, gave evidence.

Conway and Colwyn Bay Water Supply Board (June 3rd. Mr. W. O. E. Meade-King).—£6,000 for the construction of a girder bridge over the river Conway, near Dolgarrog, for the purpose of carrying the 15-in. water main which now passes under the river.—It was pointed out that, as the main under the river is liable to damage in the event of floods, and is then difficult to get at, the bridge is urgently required. Colwyn Bay's summer population was estimated at 30,000, and it would not be proper that the water supply should be in any way liable to interruption.

Market Harborough R.D.C. (June 1st. Mr. W. Shelford Bidwell).—This was an inquiry into a complaint by certain ratepayers that the council had been in default in failing to provide a water supply for Fleckney.—In the course of the proceedings Mr. H. G. Coales, the engineer and surveyor, explained a scheme which he has prepared, and which, he said, would, from a source at Mowsley, supply four villages with water. The cost for Fleckney alone would amount to £3,700, and, if carried out for the four villages, he estimated the cost at £7,000—£3,000 for Fleckney and £4,000 for the Kibworths and Smeeton. On behalf of the council it was stated that it was thought desirable to postpone the scheme until after the war.

APPLICATIONS FOR LOANS.

Birkenhead T.C.—£68,500 for building 200 workmen's houses.

Godalming T.C.—£2,830 for two boreholes and other works of water supply.

Kidderminster T.C.—£5,000 for the sewering of the added areas in the extended borough.

Skelmersdale U.D.C.—£2,000 for improvements to the gasworks.

Watford U.D.C.—£2,208 for private street works.

LOANS SANCTIONED.

Batley T.C.—£3,391 for electric cable extensions.

Bispham U.D.C.—£3,586 for electric lighting.

Bournemouth T.C.—£510 (for sixty years) and £831 (for twenty years) for the widening and improvement of St. Stephen's-road.

Colchester T.C.—£3,434 for hospital extension and road making.

Dover T.C.—£1,000 for new electricity services.

Enniscorthy R.D.C.—£3,000 for a housing scheme.

Evesham Joint Hospital Board.—£1,000 for extensions at the hospital.

Exeter T.C.—£541 for road widening.

Gower R.D.C. £420 for road diversion.

Nantyglo and Blaina U.D.C.—£557 for the purchase of land for a public improvement.

Porthcawl U.D.C. £8,000 for a new water main.

Portrush U.D.C.—£650 for a water supply to the added area.

Rotherham T.C.—£8,400 for the purchase of water-tube boilers for the generating station.

Watford U.D.C.—£26,000 for the purpose of the waterworks.

FORTHCOMING INQUIRIES.

JUNE.

		£
15.	**Barrowford.** For works of private street improvement (Mr. W. O. E. Meade-King)	2,200
15.—	**Pembroke.** For works of sewerage (Mr. F. H. Tulloch)	4,000
15.—	**Rugby.** For works of sewage disposal (Mr. A. W. Brightmore)...	1,000
17.—	**Newport (Mon.).** For the purposes of road widening (Mr. F. H. Tulloch) ...	950
17.—	**Wrexham.** For the erection of houses (Mr. W. O. E. Meade-King)	6,056
18.—	**Ellesmere Port.** For the erection of council offices (Mr. W. O. E. Meade-King)	5,500

THINGS ONE WOULD LIKE TO KNOW.

(Contributed.)

Was not the discussion on pressure filters at Shrewsbury a little disappointing, inasmuch, with one exception, all the speakers were evidently so favourably impressed with mechanical filtration as against ordinary gravity filtration, that there was really very little discussion? Can there be any doubt, however, that under certain circumstances, even if mechanical filtration is more expensive than ordinary sand-bed filtration, the mechanical filter has so greatly improved that it can be relied on to remove organic impurity when a coagulant is added to the water?

* * * *

Is it not rather to be regretted that the Institution of Municipal and County Engineers have decided to include a dinner at their annual meeting this year when so many other institutions have decided not to have any social gatherings during the war? Would it not have been more in accord with the general feeling of the community if the dinner had not been held under the present conditions?

* * * *

Why is it that the roads in and around Oxford are in such a deplorable condition? Why is it that, although nearly everyone is complaining of these roads, nothing is done to reconstruct them on modern lines?

* * * *

Is it a fact that there is a certain town in Hampshire in which the council have practically made it impossible for their surveyor to go to the Front, as they decline to keep his place open for him or to assist his family in any way? Is it not almost inconceivable that even now there are a vast number of men in this country who do not yet realise the extreme gravity of the present crisis?

* * * *

Would not Cabinet Ministers be better able to manage the affairs of the nation at this critical period if they were not hampered by sittings of "the House"? Cannot surveyors sympathise with them sometimes when, engaged in very important executive work, they have to attend a meeting of their council?

* * * *

Should not all surveyors and engineers who are troubled with settlements in buildings or roads due to mining or other causes go to Northwich and study the question? Is it not a fact that at this town and its neighbourhood one may see splendid examples of underpinning, and of scientific "needling" of buildings which have sunk in a most alarming manner? Why is it that one never hears of terrible accidents from the collapse of buildings in a place where the soil appears to be ever on the move?

* * * *

With regard to subsidences caused by mining, or other causes beyond the control of a local authority, is it a fact that the Local Government Board specially allow the use of a plastic clay for jointing stoneware pipes for sewer or drain purposes? Are there not also numerous flexible joints which can be used which will prevent breakage of joints or pipes where ground has subsided after the sewers or drains have been laid?

* * * *

Would not the question of how to prevent the breeding of flies be largely met if at country houses and public institutions there were installed one of the convenient and cheap "Domestic" refuse destructors now being made in large quantities by the New Destructor Company, Limited, at Pershore? Is it not an established fact that flies are active carriers of disease, and that the only safeguard is to prevent their birth by destroying their breeding-places? Why is it that, when there is so simple a remedy at hand, it is not universally used?

Municipal Work in Progress and Projected.

The Editor invites the co-operation of SURVEYOR *readers with a view to making information given under this head as complete and accurate as possible.*

The following are among the more important projected works of which particulars appear below:—Buildings: Birkenhead, East Suffolk, Manchester, Market Harborough, Swansea and Town Planning: Birkenhead, Market Harborough, Wrexham, York and Refuse Collection and Disposal: Cardiff, Dover. Roads and Materials: Ardsley, Barking, Stalbridge, Swansea and Sewage Disposal: Ilford, Water, Gas and Electricity: Dublin. Particulars of other projected works will be found on our "Local Government Board Inquiries" page.

BUILDINGS.

Birkenhead T.C. The Local Government Board have given their sanction to the erection of the Dingwall sanatorium being proceeded with and a tender at £7,793, has been accepted for the work.

Blackpool T.C. The council have come to an arrangement with the War Office to convert the Central Pier grand stand and concert room into a convalescent home for wounded soldiers.

Bognor U.D.C. — Answering a complaint by a councillor that the expenditure in connection with the East End public conveniences had exceeded the estimate by £216, the surveyor, Mr. O. A. Bridges, stated that building an underground lavatory was not like building a house. When he made the hole in the ground he felt like giving the whole job up. When he put in concrete it all went out of sight. The job worried him more than any other he had had to carry out. If work was carried out at a lower cost than the estimates, nothing was said about it. He gave an instance where on one occasion, by doing work himself, the cost was £1,500 below the lowest tender, while he also saved £600 in the building of the workmen's cottages. The lavatory job was a most difficult one, and he had to pay an enormous price for bricks.

Bootle T.C.—A scheme has been approved for alterations at the municipal offices, at an estimated cost of £400.

Crewe T.C. It has been agreed to erect 30 cottages at the sewage disposal works.

Canterbury T.C.—It has been decided to carry out alterations at the assistant medical officer's quarters at the asylum, at an estimated cost of £300.

Chard T.C.—A scheme has been adopted for the improvement of the Corn Exchange, including repairs to the roof.

Dublin T.C.—There is stated to be serious unemployment in Dublin, and in consequence of this the Housing Committee, in asking the council to take steps to press the claims of Dublin for the benefits of the Housing Act of last year, say the necessity for providing the financial aid proposed by the Act is extremely urgent, as unless assistance is vouchsafed from this source all further building work by the corporation must be suspended. This would be most lamentable in view of the pressing need of dealing with the housing in Dublin, as shown by the findings of the Local Government Board Departmental Committee, as well as the provision of employment in the building trade, the dearth of which, owing to the war, is clearly demonstrated.

East Suffolk C.C.—It is intended to build an isolation hospital, at an estimated cost of £6,000.

Llanelly T.C.—The Local Government Board have written sanctioning a Provisional Order to unite the borough of Llanelly, the urban district of Burry Port, and the rural district of Llanelly into a united district for hospital purposes. It was now too late, it was stated, to introduce a Provisional Order with a view to confirmation in the present session of Parliament, and the board therefore suggested that the three authorities should confer with a view of carrying out the proposed scheme by agreement. The town council on Tuesday last agreed to this suggestion.

Manchester T.C.—A modified scheme has been prepared for the extension of the meat market and abattoirs in Water-street. The estimated cost is £10,000.

Midlothian C.C.—It has been decided to provide on the sanatorium site a pavilion to contain twelve beds. The estimated cost is £3,000.

Nottingham T.C.—A report has been submitted by the Baths Committee on proposals to build baths in several parts of the town.

Swansea T.C.—It is intended to convert premises in Mansel-street into a school clinic, at a cost of £1,360.

HOUSING AND TOWN PLANNING.

Birkenhead T.C.—The council propose to make application to the Local Government Board for sanction to borrow £68,500, the estimated cost for erecting 299 dwellings in the Gilbrook estate, at the north end of the town. It is not expected, however, that building will actually be commenced until after the war. According to a report published recently, the buildings will be of four types, as follows: Type A (small), comprising ten blocks of sixty-four self-contained dwellings, with an average frontage of 16 ft. and a depth of 36 ft. Each house will have a living-room, scullery (with boiler), bath-room (separate), and food store on the ground floor, and three bedrooms on the first floor. Type A (large), comprising seven blocks of forty houses, will be a larger house after the style of Type A (small), the dwellings having an average frontage of 17 ft. 6 in. Type B, comprising ten blocks of sixty houses, will also be on the lines of Type A, and will contain an extra room on the ground floor—namely, a parlour with a bay window. These houses will face Brassey-street, Norman-street, and Lansdowne-road, and an alternative plan will be carried out with the bath-room on the upper floor in certain houses. Type C will comprise seven blocks of flats, containing 120 separate dwellings. Two blocks of the flats will face playgrounds, and will contain twelve three-room houses, consisting of living-room, two bedrooms, and scullery; and six two-room ones, with living-room, bedroom and scullery. Four other blocks will contain six three-room, six two-room, and six one-room flats; while one block will provide twelve three-room dwellings. All the houses in the flats will be entered from balconies reached by a central stone staircase.

Market Harborough U.D.C.—It has been decided to take the necessary steps for the preparation of a town planning scheme.

Mirfield U.D.C.—A site has been secured in Nettleton-road for the purpose of a housing scheme.

Wrexham R.D.C.—The council have received authority to prepare a town planning scheme.

York T.C.—The sanction of the Local Government Board has been obtained to the preparation of a town planning scheme in respect to three areas, and the city engineer, Mr. F. W. Spurr, has received instructions to take steps in connection with the competition for the prize offered by the late Dr. Tempest Anderson, and other prizes offered by the Streets and Buildings Committee, for the best scheme, with observations on the remaining areas in and around the city of York.

REFUSE COLLECTION AND DISPOSAL.

Cardiff T.C.—It has been decided to purchase 60 acres of land, at £5 per acre, and 47 acres at £1 per acre, on the East Moors for the purpose of a tip. Negotiations are in progress for the purchase of more land on an adjoining site.

Dover T.C.—With respect to the disposal of refuse the medical officer of health urged strongly that a refuse destructor should be utilised, and he pointed out the importance of destroying material which was the breeding-ground for rats, flies, and gnats. He understood that the deputy surveyor was in favour of one. The council decided to refer the consideration of the matter to a committee.

ROADS AND MATERIALS.

Ardsley U.D.C.—The surveyor, Mr. John Morley, has received instructions to report upon the best means of improving Grange-lane.

Barking U.D.C.—A resolution has been adopted that, in the case of future private street works, the charges be made repayable by half-yearly instalments, to be spread over a period of five years from the date of demand, with interest at 5 per cent per annum, provided that any owner shall have the option of paying the full amount of the apportionment within six months of the date of demand.

Cork T.C.—The Public Works Committee have been authorised to incur an expenditure of £500 on the concreting of footpaths.

Doncaster T.C.—An important street improvement is contemplated at the junction of St. Sepulchregate and West Laithgate.

Golcar U.D.C.—Repairs, estimated to cost £891, are to be carried out in several roads.

Hampton Wick U.D.C.—The surveyor, Mr. P. Taylor, was on Monday authorised to purchase 4,000 wood blocks for repairs to the High-street and Upper Teddington-road.

Henley-on-Thames R.D.C.—It was decided on Tuesday to suspend all road-repairing work during July and August to release the council's employees for harvest work.

Kidsgrove U.D.C.—Road repairs, including tar-spraying, are to be carried out at a cost of £1,000.

Leeds T.C.—It has been agreed to carry out the widening of Nippet-lane, at a cost of £1,458, including £1,220 for the purchase of land.

Mutford (East Suffolk) R.D.C.—Tarring is to be carried out on certain roads at an estimated cost of £274.

Newry No. 2 R.D.C.—It was reported that only two of eleven ordinary road maintenance proposals and only three of twenty special works were tendered for. The clerk said he assumed that the scarcity of contractors was due to the difficulty of getting labourers at the present time, and to the fact that, as the farmers were getting such good prices for their produce, they did not care about going in for road works. The county surveyor, Mr. R. H. Dorman, said that most of the works were necessary. If they were given into his hands he could not guarantee to carry them out, as he might not be able to get labour, but he would do his best. The council approved of the arrangements proposed by the county surveyor for the provision of materials, horse work, and tools in respect of the second and third class roads in the direct labour scheme for the current year.

Perthshire C.C.—A letter has been received from the Road Board by the Highland District Committee on the subject of limiting expenditure on roads to necessary work in view of national economy, expenditure at the same time being sanctioned for tar-spraying the surfaces of certain roads. With regard to outlays on experimental sections of roads, arranged in conjunction with the Road Board, and now abandoned, the Local Government Board intimated that the cost of all instruments would be refunded, together with 75 per cent of the cost of materials.

Rotherham T.C.—Sanction has been received from the Treasury for the borrowing of £1,000 in order to complete the works in Corporation-street.

St. Germans R.D.C.—The assistant county surveyor, Mr. H. A. Hosking, wrote suggesting a reconsideration of the council's decision not to employ a stone crusher in Heskyn quarry, pointing out that with the present scarcity of manual labour it would be impossible not only to carry out the council's contract to supply the county with 1,300 yds. of stone, but their own requirements of 1,000 yds. as well. If the council still declined to take advantage of a crusher some strong line of action must be taken by the county authority. The chairman, Mr. K. G. Foster, suggested they should hire the crusher themselves without any interference whatever from the county council, and a resolution to that effect was adopted.

Stirlingshire C.C.—A scheme has been prepared by the Western District Committee for the improvement of the Glasgow-Aberfoyle road.

Staffs C.C.—The road estimates approved by the council include an additional expenditure of £3,000 on Tarvia, £1,800 more on ordinary maintenance, and £250 on tar-spraying. The Treasury have promised the council a grant of £10,500 through the Road Board. At the meeting of the county council recently Mr. Newton also called attention to the excellent annual report of the county surveyor. There were two paragraphs in it to which he would like to call their attention. They would see that they were expending a considerable amount of money on roads in the Walsall and Birmingham district from which they reaped little or no benefit, and he would like to know how they could recoup themselves for this expenditure. Could it be done by increasing the taxation on the heavy vehicles, particularly motor 'buses, which had come into existence so recently, and were doing more damage to the roads than any other vehicles travelling upon them? People who owned big motor vehicles would come from Coventry to fetch a 2-cwt. load, and they had the roads kept in order for nothing. They were swindling the railway companies. Mr. Brown said that in a Birmingham newspaper recently there was an advertisement of a firm whose lorries went to Manchester every day, and they were offering to bring back goods from Manchester at the same rates the railways charged. It was grossly unfair that these people should not pay to the rates, while railway companies had to pay for every inch of permanent way.

Torquay T.C.—A grant of £150 has been received from the county council towards the cost of tar-spraying the main roads.

Winchester T.C.—The scheme for widening Bridge-street has been advanced a step by the purchase of property at a cost of £900.

SEWERAGE AND SEWAGE DISPOSAL.

Blackburn R.D.C.—It has been agreed to carry out improvements at the sewage disposal works, at an estimated cost of £350.

Brownhills U.D.C.—The surveyor, Mr. J. H. Shaw, has been asked to prepare a scheme for laying a new sewer above the Hall-lane sewer.

Durham T.C.—Plans have been prepared by the city surveyor, Mr. J. T. Pegge, for a new sewer from South-street to Margery-lane, and the county council have agreed to construct a sewer from Wanless-terrace along St. Nicholas' cemetery, to within 100 ft. of a proposed new street.

Isle of Wight R.D.C.—The council are conferring with the Shanklin Urban District Council on the subject of the Chillerton sewerage scheme.

Radstock U.D.C.—The surveyor, Mr. G. H. Gibson, reported recently that on just over 2 acres of sewage land they last year grew 81 tons 17 cwt. of wurzel, which was sold for £42 19s. 6d. Additional small crops realised £3 5s., making a total of £46 4s. 6d. The cost for manual labour was £20 17s. 2d.; horse hire, £3 10s.; seeds, 19s. 11d.; advertising, 10s. 6d.; total, £24 17s. 7d.

Truro T.C.—A letter has been received from the Local Government Board stating that they were unable to sanction a loan for £24,300 for the carrying out of the scheme for sewerage and sewage disposal at the present time, but the corporation should proceed with the negotiations for a lease of the lands required for the purposes of the scheme.

WATER, GAS, AND ELECTRICITY.

Bourne R.D.C.—The Sanitary Committee, having considered the draft agreement for the purchase of the existing water supply at Castle Bytham, recommended a slight alteration to one of the clauses, and the council directed that it should be sent to the parish council to consider.

Coleraine U.D.C.—The council have approved a proposal of the Improvement Committee, in connection with the construction of a new service tank at Ballyvassal reservoir, that the engineers of the scheme be paid at the rate of 4 per cent on the amount of the contract.

Cowdenbeath T.C.—Some time ago the council negotiated with the District Committee of the county council for a supply of water from Loch Glow, and came to an understanding that, when times permitted, the town would be assured of 162,000 gallons per day, involving a capital expenditure of, approximately, £13,000. Owing, however, to unforeseen circumstances, the Admiralty and the District Committee are unable to grant this, and it has been decided to revert to the Dalbeath Pit water.

Driffield R.D.C.—A Local Government inquiry was held recently into a proposal to apply for £180 for the purpose of providing a water supply for the village of Foston. Mr. Brightmore, the Local Government Board inspector, has reported favourably on the scheme, which was prepared by Messrs. Fairbank & Son, of York, and the council decided recently to instruct the engineers to proceed with the matter, and to invite tenders for the work.

Dublin T.C.—The council on Monday last authorised the borrowing of £34,842 for the purposes of waterworks.

Heanor U.D.C.—Replying to a question with respect to the new water-softening process now being tried

experimentally by the Ilkeston and Heanor Water Board. Mr. Andrews stated that the board had a report from the engineer which showed that the portion of water treated by the new filter was considerably improved. The total of filters required to treat the whole of the water would be from twelve to twenty. Whether the scheme could be made financially workable was not yet decided, the experiment not being complete or a final result obtained. He wished to make it clear that the experiment was being made at the expense of the inventors of the system, and not of the board, and that the company would in case of rejection take out their plant at their own expense.

Howden R.D.C.—A letter has been received from the Local Government Board stating that the board considered that the preparations of the Howden water supply scheme should be proceeded with, in order that the work might be put in hand when more favourable conditions prevailed. Colonel Saltmarshe said that there were obvious reasons for not going on with the scheme during the war, and the Local Government Board had apparently accepted those reasons. As regarded the preparation of the scheme, if it was assumed that the war would last two years, the conditions in the district would be likely to vary in that time. A scheme for bringing water towards the western area of the council's district—namely, from the Selby side across the bed of the river Ouse to a part of the Riccall Rural District—was to be carried out, and it was quite possible that the facilities offered by this scheme might induce the Howden Council to vary their scheme. It was decided to explain these facts to the Local Government Board.

Knaresborough U.D.C.—The council on Monday decided to increase the price of gas by 3d. per 1,000 ft., and to allow the usual £250 from the profits for the relief of the district rates.

Middlesbrough T.C.—The Local Government Board have sanctioned a loan to cover the expenditure for laying electricity mains to works engaged on making munitions of war.

Nottingham T.C.—Dealing with the annual report of the Water Committee, Alderman Hunstman stated at the council meeting on Monday that there was a movement on foot to improve the water, the supply of which was cut off some time ago because of the disastrous effects on iron pipes. The committee could not look on that state of things with satisfaction. Scientific investigations were made, and they were satisfied that without any kind of doctoring the water could by a certain process, purely natural, be made suitable for consumption and use. That method they had decided to adopt. The particular needs of local industries were considered, and it had occurred to them that they might make the water conform to their peculiar needs. In a general scheme that could not be done, and Nottingham had therefore decided to spend money in the work of suitable plant for the treatment of their own supply. He believed that it would then be found in all respects satisfactory, and would be an exceedingly important part of their supply.

Penrith R.D.C.—A scheme, estimated to cost £470, has been prepared for obtaining a water supply for the north-east part of Skelton.

Taunton T.C.—The electricity undertaking last financial year showed a loss of about £600, and the council have decided to advance by 10 per cent. the prices of current used for lighting purposes.

MISCELLANEOUS.

Barking U.D.C.—The council have approved a recommendation of the Town Planning Committee that the necessary steps be taken to establish a municipal market or markets in Barking; also that the surveyor, Mr. C. F. Dawson, submit a report to the next meeting of the committee upon the most suitable site for markets in the town, and the probable cost.

Carnarvon T.C.—With reference to the cemetery, which is in course of being laid out, the accountant reported that the expenditure so far amounted to £1,980, towards which the council had borrowing powers for £1,880. For a further expenditure of about £150 it was estimated that the cemetery could be brought to a state where it might be left for some time, and it was therefore decided to ask the Local Government Board to sanction the borrowing of a further sum of £250 to cover the excess expenditure.

Chelmsford T.C.—In view of possible enemy air raids the strength of the fire brigade has been augmented by the appointment of fifteen volunteer firemen, and the borough engineer, Mr. P. T. Harrison, has been authorised to purchase 500 ft. of hose and necessary couplings, two stand-posts and four branches, one hand truck, twelve belts and axes, and fifteen armlets, the estimated cost being £60. Arrangements had been made for the volunteer firemen to be called upon any outbreak of fire occurring through an air raid.

Salford T.C.—It was reported to the Watch Committee on Monday that there was no further need for the use of horses for fire brigade work in the borough. For some time the committee has been purchasing the chassis of motor-cars, which have been completely overhauled by members of the brigade, and have been connected with fire engines and ambulances.

Twickenham U.D.C.—On Saturday the new motor [illegible], which has been supplied by Messrs. Dennis Brothers, of Guildford, at a contract price of £1,125, was officially and most satisfactorily tested. The engine is of 60-h.p., and capable of travelling at a rate up to 20 miles per hour on the level, and 12 miles per hour on a gradient of 1 in 7. The main pump, which is of the multi-stage turbine type, is driven by the road propelling engines, and is designed to throw 450 gallons of water at 120 lb. per square inch per minute. A 50-ft. sliding carriage escape is carried on the [illegible] which can be used as a water tower, and [illegible] can be extended to 60 ft. by means of the first floor ladder. Accommodation is provided [illegible] complement of fire gear and twelve men, and the machine is also fitted with a portable acetylene searchlight for lighting the road or throwing a searchlight upon any portion of a building.—Permission has been received from the Port of London Authority to moor a barge at Marble Hill for the purpose of a bathing station, and the council have accepted the tender of Messrs. John Selbourne & Co., at £37, for providing and driving the necessary piles for mooring [illegible].

PERSONAL.

Mr. [illegible] Mackenzie, surveyor to the Llanrwst Urban District Council, has resigned.

Mr. Thomas McAuliffe has been appointed surveyor to the Llanrwst Urban District Council.

Mr. Charles Horobin, acting engineer, has been appointed waterworks engineer to the Lincoln Corporation at a salary of £250 a year.

Mr. H. Blewitt, surveyor to the Mutford (East Suffolk) Rural District Council, has had his salary increased from £125 to £140 a year.

Mr. J. Rowbottom, deputy borough engineer of Ashton-under-Lyne, has received an honorarium of £100 for special services as engineer for the reconstruction [illegible] special works.

Major Henry Macaulay, formerly borough engineer and architect to the Kingston (Surrey) Corporation, is to be congratulated on retaining excellent health, [illegible] on Thursday of last week he reached the age of eighty-five.

Mr. Archibald Wilson, county road surveyor of Dumbartonshire since 1868, has been appointed advising surveyor and consulting engineer to the council; Mr. James Andrew, assistant to Mr. Wilson, has been appointed county road surveyor; and Mr. Peter Miller has been promoted to the position of assistant road surveyor.

Mr. Cyril B. Henry, son of Mr. T. Henry, surveyor to the East Retford Rural District Council, has passed his final examination as a Licentiate in Dental Surgery of the Royal College of Surgeons, England. Mr. Cyril Henry, who is only twenty-one years of age, has now been appointed house surgeon at the Royal Dental Hospital, London. He won the "Saunders" scholarship, which is considered the blue ribbon of the Royal Dental Hospital, and other prizes. Mr. F. Allen Henry, second son of Mr. Thomas Henry, has been appointed midshipman, R.N.R., on H.M.S. "New Zealand," and has joined his ship. The "New Zealand" is a battle cruiser of 18,800 tons, and was built at the charge of the New Zealand Government.

Columbia University has appointed the following non-resident lecturers for the 1915-16 session of the Graduate Course in Highway Engineering: Messrs. Charles J. Bennett, State Highway Commissioner of Connecticut; John A. Bensel, consulting engineer;

Will P. Blair, secretary, National Paving Brick Manufacturers' Association; Sumner R. Church, manager, research department, Barrett Manufacturing Company; Frederick A. Cleveland, director, Bureau of Municipal Research, New York; William H. Connell, chief, Bureau of Highways and Street Cleaning, Philadelphia; Morris Llewellyn Cooke, director, Department of Public Works, Philadelphia; W. W. Crosby, chief engineer, Maryland Geological and Economic Survey and consulting engineer; Charles Henry Davis, president, National Highways Association; A. W. Dow, chemical and consulting paving engineer; Edwin Duffey, Commissioner of Highways, New York State; Lewis R. Ferguson, assistant secretary, Association of American Portland Cement Manufacturers; C. N. Forrest, chief chemist, the Barber Asphalt Paving Company; Wilson P. Foss, senr., president, the New York Trap Rock Company; Walter H. Fulweiler, chief chemist, the United Gas Improvement Company; E. P. Goodrich, consulting engineer; D. L. Hough, president, the Cuban Engineering and Contracting Company; William A. Howell, engineer of streets and highways, Newark; Nelson P. Lewis, chief engineer, Board of Estimate and Apportionment, New York; Walter R. Marden, vice-president and chief engineer, the United Construction Company; H. B. Pullar, general manager, the Pioneer Asphalt Company; Philip P. Sharples, manager, general Tarvia department, Barrett Manufacturing Company; Francis P. Smith, chemical and consulting paving engineer; Albert Somner, consulting chemical engineer; George W. Tillson, consulting engineer to the President of the Borough of Brooklyn, New York; John Cassan Wait, attorney-at-law; George C. Warren, president, Warren Brothers Company.

OBITUARY.

Mr. R. W. Smith Saville, borough engineer and surveyor of Darwen, died, we regret to state, on the 2nd inst., after an illness of two months. Mr. Saville proceeded to Darwen from Burton-on-Trent in September, 1896, when he was appointed successor to Mr. W. Stubbs. During the time he held the appointment he carried through many important schemes, including the electrification of the tramways and the laying of the tramway to Hoddleston. He was also responsible for the new sewage works, the electricity works and destructor, the laying out of Sunnyhurst Wood, the improvement of Belgrave-square, and the erection of new schools at Sudellside and Springbank. He was officially concerned in the taking over of a supply of water from the Bolton Corporation. The *Darwen News*, in a eulogium of Mr. Saville, says: "In his work, whether pertaining to architecture or to general construction, he exhibited great taste and ability in design, and perhaps the one pity was that Darwen was not sufficiently large to give full scope to his ideas and ability. His ideals were very lofty, and the greater and more important the work the more agreeable to Mr. Saville, and had he been in charge of a larger borough, with greater financial opportunities, the very best would have been brought out of him. His energy and enthusiasm were unlimited, and whatever object claimed his attention he entered into it with a zeal possessed by few people. His organising powers were great."

Stream Pollution from Gas-tar.—An application in the High Courts has been granted restraining the Ashbourne Rural District Council from polluting the river Henmore with gas-tar from their gasworks.

New Bowling Greens at Todmorden.—Two new bowling greens which have been constructed by the Todmorden Corporation in Centre Vale Park, were formally opened on Tuesday. The cost (including pavilion and shelter) was about £100.

Thames Conservancy: Proposed New Lock at Molesey. In April last a breach was caused in the island between the lock cut and the weir stream at Molesey, and it was agreed to repair it at a cost of £660. On Monday there was considered a proposal of the engineer that in lieu of repairing the breach a small lock be constructed on the site which has been scoured out. The existing lock is 267 ft. by 30 ft., the proposed additional one would be 60 ft. by 10 ft., and its estimated cost, with wing walls and protective work, £2,000. It was agreed to abandon the scheme unless the Metropolitan Water Board—who, it was stated, lost 250,000 gallons of water every time the big lock was used—would agree to pay half of the full cost.

EURIPIDES.

HOUSEHOLDERS AND FIRES DUE TO AIR RAIDS.

To the Editor of THE SURVEYOR.

SIR,—Since the issue of the British Fire Prevention Committee's "Warnings" as to the character of the fires resulting from air raids, and the best means of dealing with them, many hundreds of householders have addressed themselves to this office as to whether they would be well advised to expend money on certain classes of proprietary or patented minor chemical fire appliances.

The committee has thus deemed it to be in the public interest to make the following announcement supplemental to their previous "warnings," more particularly as householders, in their anxiety to protect their premises, are frequently induced to obtain entirely unsuitable and unreliable apparatus in lieu of the more simple and economical appliances on which they can depend:—

(*a*) Ordinary domestic buildings, shops and offices should have an ample supply of buckets (kept ready filled with water), and, where funds permit, one or more small hand pumps. Occupants should know how to use these simple appliances efficiently.

(*b*) Pitchers and other minor household vessels should be kept filled ready for use, and where there are baths, wash-tubs, &c., these should be kept filled, so that a supply of water may be available independently of the water mains. Where there are garden utensils, such as syringes, garden pumps, &c., they should be readily accessible.

(*c*) On no account should money be expended on powder extinguishers (tubes), hand grenades (glass bottles or tubes), extinguishers and squirts containing carbon tetrachloride or similar chemicals which are liable to form noxious gases. Such appliances are unreliable or unsuitable.

(*d*) If portable liquid chemical fire extinguishers are desired, they should be of 2 or 3 gallons capacity, and a warranty should be obtained that they comply either with the specifications of the Board of Trade, H.M. Office of Works, the Metropolitan Police, or of this committee, these specifications being mainly intended to prevent accidents from bursting.

The public should remember that fires caused by incendiary bombs, if promptly tackled with water in fair bulk, force and continuity, need not spread, and are not quite the terrifying problem to deal with that the enemy would make them. It is mainly a matter of concentrating the available liquid fire appliances, and applying water energetically, so as to obtain the necessary cooling effect. The incendiary bombs so far used by the Germans do not, as a rule, contain petrol, but thermit, which, on combustion, takes the form of molten metal of high temperature, resultant fires having none of the characteristics of spirit fires, which latter require the use of sand.

In any event every effort should be made by the public to assist the fire brigades in their onerous duties; but they should not omit, on any account, immediately to notify any outbreak that comes to their notice by telephone or otherwise, the method of calling assistance to be posted up.

Those who desire additional useful hints on the fire question arising from possible air raids should apply for the British Fire Prevention Committee's "Warnings," which are provided gratuitously upon written application to the registrar at 8 Waterloo-place, Pall-mall, London, S.W. (enclosing large-size stamped and addressed envelope). These "Warnings" give useful information as to the necessary precautions, and how to act when the emergency arises.—Yours, &c.,

ELLIS MARSTAND,
General Hon. Secretary,
British Fire Prevention Committee.

8 Waterloo-place, S.W.
June 8, 1915.

New Ribble Bridge Opened.—The new county council bridge which has been erected over the river Ribble at Preston, at a cost of £40,000, and which incidentally shortens the distance between Preston and Liverpool by nearly two-thirds of a mile, was formally opened on Wednesday by Sir William Scott Barrett, chairman of the county council. The original bridge was built in 1750, and proved quite inadequate for present traffic.

The Fitting up and Working of a Sewage Works Laboratory.*

By JAMES H. EDMONDSON, F.C.S., Chemist and Manager of the Southall-Norwood Sewage Works.

Mr. Reginald Brown, M.INST.C.E., &c., the engineer to the council, has suggested to the author that a short paper on this subject might be of interest, especially as a large number of sewage works are under the control of members of the institution. The author has accepted the suggestion, although a large amount of literature has already been published on this matter, and much valuable information can be obtained on the question of standards and analysis by a perusal of the various reports of the Royal Commission on Sewage Disposal. Having been an assistant at the Manchester sewage works, the author's remarks on the various tests carried out, and the method- adopted in a sewage works laboratory—such as at Southall-Norwood—apply to those in which he has had practical experience—viz., those recommended by Dr. Fowler and used in the Manchester laboratory, as well as those recommended by the Royal Commission.

Fitting up a Laboratory.—In designing and fitting up a laboratory at a sewage works one is seldom able to go in for an elaborate building, neither is it necessary to do so. A laboratory should be useful before being ornamental. The essential points to be observed in the construction must not, however, be overlooked. These are—stability, good lighting, ventilation, comfort to the workers, and proper provision for the protection of the instruments and appliances used.

The question of the materials of which a laboratory should be constructed is one of £ s. d. and local circumstances. At Southall one could only afford a corrugated iron building, lined with matchboarding; but after inspection the members will, the author hopes, agree that the structure is suitable for its purpose. Bearing in mind the use to which a laboratory is put and the value of the expression of the results obtained, depending to a considerable degree upon the delicacy of the weighing instruments, it will be seen how necessary it is that the laboratory should be as free as possible from vibration. The constant passing of heavy goods trains along the Brentford Docks branch of the Great Western Railway causes a considerable tremor in the ground at the Southall-Norwood sewage works, and to minimise this the building has been erected on piers. This construction also protects the building from floods, which at intervals occur, owing to the raising of the water level of the canal. Good lighting is necessary, owing to the number of calorimetric operations carried out, and efficient ventilation, to get rid of the fumes arising from some of the tests. Comfort for the workers is by no means the least of the provisions to be made, as the chemist and his assistants are engaged a good many hours in the laboratory, and cold draughts and cold feet and limbs should be avoided as far as possible. The analytical balance being one of the most important instruments used, it is essentially necessary not only to protect it from vibration, but also from dust and chemical fumes, and it is usual in many laboratories to provide a special room for it. The general arrangements of the author's laboratory are shown in the plan below, by which it will be seen that the balance is kept in a small office, in which the author also keeps the records, &c.

As the laboratory contains dangerous chemicals and delicate apparatus, the general workmen and others are not permitted access to same, but remain in a lobby. The work-room is provided with the necessary benches and cupboards, tables and shelves for chemicals, &c. The fume cupboard shown is for the purpose of getting rid of objectionable and poisonous fumes generated by various tests, and is ventilated into the external air. It is a simple wooden construction, having an ordinary window sash for access to same. As a fair amount of bottle washing takes place a sink and water supply is provided, and the necessary gas jets and fittings are in use for heating purposes. Unfortunately, owing to the situation of the works, the water supply is not laid on from the town mains, and it was necessary to use well water, and although this water is very contaminated, it can be, and is, used for washing and condensing purposes. The cost of the laboratory building was £50, and the necessary chemicals, apparatus and fittings, £60.

* Paper presented at the meeting of the Eastern District of the Institution of Municipal and County Engineers held at Southall on Saturday last.

WORKING.

Sampling.—The author would emphasise the fact that if information of any real value is to be obtained, the taking of samples should have special care. Snap samples convey very little, except that the condition of the sewage or effluent at the particular moment at which the sample was taken. Obviously, to be of value, the samples should be taken continuously over every twenty-four hours, say at hourly intervals, and mixed together in proportion, according to the flow. At the author's works, as at many others, the varying flow of the sewage has to be gauged from experience, as there is no measuring or recording apparatus. Experience at any particular works will very soon give the manager or chemist a fairly accurate idea of the variations in the quantity to be dealt with. As the members of the institution are aware, there are several forms of recording apparatus on the market, and one of these would be useful where they could be conveniently fixed, as the varying volume can by its use be easily recognised. As to the commencement and termination of the daily period over which the samples are to be arranged, different works may have different times. A convenient period is from 6 a.m. to 6 a.m.; but, of course, the objection to any such period is that the sample at any particular hour, from, say, the tanks, does not represent the equivalent in the crude sewage; hence the average daily samples of the crude sewage do not altogether correspond with the average samples from other points of the process of purification. This is apparent from the chloride figures; but, the variations being small, the results can be compared with

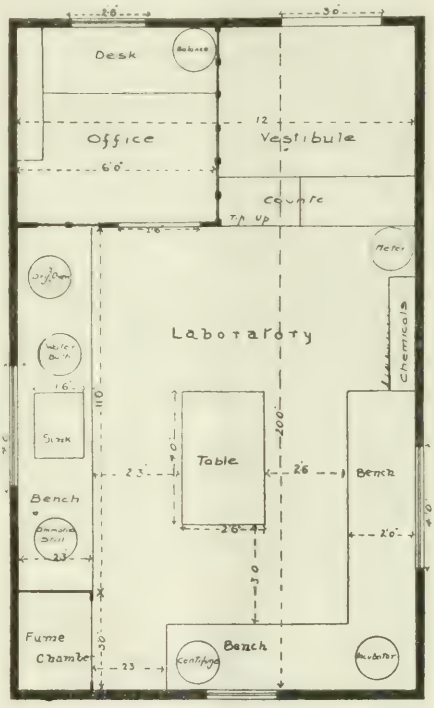

FIG. 1.

confidence, without any serious degree of inaccuracy creeping in.

TESTS.

The Royal Commission on Sewage Disposal has endeavoured to fix upon certain standards to which effluents from sewage works ought to conform, together with the methods of carrying out the various tests, all of which have no doubt been studied by the members of the institution, as they occur in the Eighth Report of the commission, together with the appendices. The only tests recommended by them are suspended solids and dissolved oxygen, but a large number of sewage works chemists carry out other tests, such as the four hours' oxygen absorption, chlorides, free and saline ammonia (ammoniacal nitrogen), albuminoid ammonia (albuminoid nitrogen), nitrites (nitrous nitrogen), nitrates (nitric nitrogen), three minutes oxygen absorption before and after incubation, and others, according to the sewage dealt with and the information required to be ascertained under particular circumstances. A few of these tests, along with their interpretation, will be briefly described.

Suspended Solids.—The importance of this test arises from the fact that the larger the amount of solids present in the final effluent the greater the pollution to the river into which it flows. The pollution caused by solids may be of two kinds—organic and mineral. With the former the discharge may give rise to nuisance, and the latter causes silting. The former is, of course, of the greatest moment, and the final effluent should therefore contain as little suspended solids as possible. The Royal Commission agreed that the degree of the treatment of sewage should depend somewhat on the nature of the stream, and suggested a certain standard for suspended solids, but not a hard-and-fast rule to be applied in all cases. The standard suggested is, "That the effluent shall not contain more than 3 parts of suspended solids per 100,000." In the laboratory the test may be carried out by means of a "Centrifuge," in which the solids from a measured quantity of liquid are extracted by the process of "whirling," the solids being afterwards placed in a weighed crucible, and the water evaporated off on a water bath, and afterwards dried in an air oven at 105 deg. Cent. The difference in weight between the weighed crucible and the combined weight of the crucible and dried solids gives the total amount of suspended solids in the quantity of the sample taken. As these solids are both organic and mineral, the amount of each can be ascertained by ignition at red heat, which destroys the organic and volatile matter.

The standard suggested by the commission is rather a stringent one, especially during the spring, when the sewage works is troubled with the spring outflush of solids, and even with a humus tank the standard is a difficult one to attain.

The Dissolved Oxygen Test.—For a full explanation of this (together with the last described) the author would refer the members to the Eighth Report of the Royal Commission.

It is considered the best test to give a real idea of what would take place in any stream by reason of the discharge of the particular effluent tested, inasmuch as the amount of oxygen can be approximately estimated that the particular sample under examination will absorb from the stream. This, coupled with the volume of such effluent or sewage, along with the quality and quantity of the stream into which it is discharged, gives a fair index of any possible pollution. Should the sewage effluent absorb all the oxygen from the stream, putrefaction will be set up by that portion of the organic matter in the sewage effluent which is unoxidised, causing a pollution in the lower reaches of the waterway. After much experimenting the Royal Commission have suggested a general standard, "that an effluent should not absorb more than 2 parts of oxygen per 100,000 from aërated tap water in five days, at 65 deg. Fahr., such standard to be movable according to local conditions." Neglecting the question of suspended solids, this standard is no more stringent than those adopted by the various watersheds and county councils; in fact, with a well nitrified effluent, the suggested standard is less stringent. But with a diluted tank effluent—which would pass the present standards—it would prove more stringent, and would in all probability fail it.

Four Hours' Oxygen Absorption Test.—This is the chief test carried out on most sewage works, owing to the ease with which it can be estimated. Although the test measures to a considerable degree of accuracy the amount of putrescible organic matter in a polluted liquid, it must not be forgotten that, as the results are affected by the presence of certain trade wastes the interpretation of such results must depend upon the knowledge possessed by the interpreter of the sewage under examination. The estimation of the quantity of the oxygen absorbed is carried out as follows: Two stoppered bottles are taken, and a measured quantity of diluted sulphuric acid, and also a solution of potassium permanganate of known strength is added. One of these bottles is kept as a blank, and the other used for testing the sample. In the latter is placed a quantity of liquid under examination, the quantity depending upon the amount of organic matter therein—*e.g.*, a larger quantity of liquid of greater purity being required than one of a lesser degree of purity—and both bottles allowed to stand in an incubator for four hours, kept at the standard temperature of 27 deg. Cent. In many cases there is no incubator provided; hence the liquids have to be exposed to the temperature of the laboratory. At the expiration of the four hours potassium iodide solution is added, and afterwards titrated against a standard (N/40) solution of sodium thiosulphate (1 c.c. is equivalent to ·2 mgm. of oxygen) until a faint straw colour is obtained, when a small quantity of starch solution is added. This gives a deep blue colour, which is carefully dispelled by the further addition of the standard sodium thiosulphate solution until the colour just disappears. As ·1 c.c. of the sodium thiosulphate solution is equivalent to ·2 mgm. of oxygen, the amount of oxygen absorbed can be estimated by a simple calculation. At the Southall-Norwood works an N/80 solution of potassium permanganate is used, whereas the Royal Commission recommend the use of N/8 solution; but the author has made several comparisons of the two solutions, and he is not alone in coming to the conclusion that the N/80 solution is far more delicate, and gives more consistent results.

This test has been adopted by a large number of watershed authorities, with the following classifications:

Below 0·71 part of oxygen absorbed per 100,000—good.
Between 0·71 and 1·43 parts of oxygen absorbed per 100,000—fair.
Between 1·43 and 2·14 parts of oxygen absorbed per 100,000—unsatisfactory.
Over 2·14 parts of oxygen absorbed per 100,000—bad.

In the classification of the strengths of crude sewages, the Royal Commission recommend the following:—

7 to 8 parts of oxygen absorbed per 100,000—weak.
10 to 12 parts of oxygen absorbed per 100,000—average.
17 to 25 parts of oxygen absorbed per 100,000—strong.

Chlorides.—By this test the amount of chlorides in terms of chlorine present in the sample may be ascertained. Its value, so far as sewage works are concerned, is in being able to compare not only the strength of domestic sewage, but also—owing to the fact that no degree of purification reduces the amount of chlorine—the final result with the crude sewage. To be quite accurate it is, of course, necessary that the chlorine figure in both should be the same, and unless this is so the liquids are not absolutely comparative. Although it is impossible in a sewage works to obtain a final effluent to compare exactly with any crude sewage at any particular moment, with care in sampling and a thorough knowledge of any particular works, any defect in the difference of the chlorine figure can be minimised to such a degree as to be quite accurate enough for all practical purposes. The test is also of considerable value in ascertaining the dilution of sewage in times of storm. The solutions required for this test are silver nitrate (1 c.c. being equivalent to 1 mgm. of Cl) and potassium chromate, and, if acid is present, ammonia can be used to overcome same before the test is applied.

From the particulars given in Mr. Brown's paper it will be seen that the chlorine figure at the author's works is very high, but this is entirely due to trade waste.

Free and Saline Ammonia (Ammoniacal Nitrogen).—The greater part of the nitrogen in sewage is present in the urea contained in the urine. This urea is rapidly converted into ammonium carbonate by ammoniacal fermentation, and in most cases such fermentation is practically complete by the time the sewage arrives at the works. In any case, after passage through the tanks there is little doubt that it is quite complete. Should the tank capacity be large in comparison to the flow of sewage, other fermentations will take place, such as the breaking down of the complex nitrogenous organic bodies into simple

[illegible] septic action is not required, it points to too great a [illegible] the tanks [illegible]

[illegible] and by [illegible] a measured quantity of [illegible] 50 c.c. of the sample, 2 c.c. of [illegible] of a 10 per cent. solution of sodium carbonate. Some of the water is boiled off to ensure that remaining [illegible] then added. The flask is connected to the condenser again and a further quantity boiled off, the distillate being collected in a graduated flask. The liquid remaining in the boiling flask is [illegible] mination of the albuminoid nitrogen (described later). The amount of ammon a is then estimated as nitrogen [illegible] proportion of the distillate, which has been Nesslerised against a standard solution of ammonium chloride.

The Nessler solution is prepared as recommended by Drs. Wilson and Calvert. It is extremely sensitive, and is a great saving of potassium iodide.

Albuminoid Ammonia (Nitrogen).—The majority of this nitrogen is that contained in the albumen and undigested portions of food contained in the fæcal matter, and, as already stated, it is [illegible] being [illegible] in the [illegible] tanks or bacterial filters into simple ammonia compounds.

The [illegible] of this estimation is that devised by Wanklyn, which depends upon the fact that complex nitrogenous organic bodies are partially decomposed by boiling with a strong oxidising agent—namely, an alkaline solution of potassium permanganate. This test does not give the whole amount of the organic nitrogen present in the sample, but rather that portion of it which is liable to cause putrefaction when undergoing decomposition.

To the liquid left in the boiling flask after the free ammonia has been collected a measured quantity of potassium permanganate in caustic potash or soda is added. The liquid in the flask is then boiled, and the distillate collected in a 100-c.c. stoppered cylinder, with two further 50 c.c. collected in Nessler tubes. These distillates are compared against a similar standard as the ammoniacal nitrogen on a Stoke's calorimeter. If the 100 c.c. of the distillate is stronger than the standard, then an aliquot proportion of it is read.

Where the four hours' oxygen test is not adopted as the standard by the rivers authorities, the albuminoid nitrogen test is generally used, with the following classifications:—

Below 0·1 parts per 100,000—good.

Between 0·1 and 0·15 parts per 100,000—fair.

Between 0·15 and 0·20 parts per 100,000—unsatisfactory.

Over 0·20 parts per 100,000—bad.

Nitrates (Nitric Nitrogen).—This is an [illegible] product of the oxidation of ammonia to nitrate by the agency of bacteria. Owing to the fact that nitrites and nitrates are formed practically [illegible] but or no nitrate is found in a healthy bacterial filter. It is also formed by the reduction of nitrate, and it is no doubt due to this reduction when it is found in a filter. Consequently, when a filter shows [illegible] of an appreciable quantity, say 0·2 parts per 100,000, it is a fairly true index that there is insufficient aëration in the filter, due possibly to it being sealed over, and requires immediate attention. Of course, this estimation is only necessary with filter effluents. The method of estimation is by adding to 50 c.c. of the sample 2 c.c. of Greiss-Ilosvay's solution, and allowing it to stand twenty minutes, when, if any nitrite is present, a brilliant red colouration is produced, the intensity being in proportion to the nitrite present. This, at the end of the twenty minutes, is compared against a standard solution of sodium nitrite (made from silver nitrite), similarly treated to the sample.

Nitrates (Nitric Nitrogen).—This estimation is of great importance, as it shows to a certain extent the efficiency of the filters. It is, of course, the nitrogen in the organic matter oxidised to nitrates. If all the nitrogen in the sewage was eliminated on passing through the filters, only about 66 per cent of it would be accounted for by the nitrate, the remainder having possibly escaped into the atmosphere as nitrogen and its oxides.

The estimation is carried out by placing a measured quantity of the filter effluent in a conical flask, together with the same quantity of water and 2 c.c. of a 10 per cent solution of sodium carbonate. This is then boiled down until all the free ammonia has been expelled. The liquid is now slightly acidified with acetic acid and poured on to a copper zinc couple. The acid in the liquid acts on this couple, forming nascent hydrogen, which has the power of reducing nitrate to ammonia. After contact with the couple for at least twelve hours, the liquid is poured into a boiling flask on the condenser, containing a solution of sodium hydrate. (This water has already been boiled to expel any ammonia present.) The flask is now coupled up and the liquid boiled. A quantity is distilled off and treated exactly as the ammonias previously described—viz., by taking an aliquot proportion of the distillate, Nesslerising, and reading against the standard ammonium chloride solution on a Stoke's calorimeter.

The tests described form the routine tests carried out in the Southall-Norwood laboratory, and are, in fact, the routine tests adopted at most sewage works laboratories, in conjunction with any special ones which local circumstances demand, such as the following:

(1) *The [illegible] Test.*—[illegible] value when considering the question of precipitants. A description need not be given here, as a full explanation was given in a paper read before the Society of Chemical Industry by Dr. Fowler and two of his assistants, and can be seen by referring to their *Journal*, vol. xxvii.

(2) *The [illegible] Test.*—When [illegible] at 27 deg. Cent. for seven days, the amount of oxygen absorbed from acidified potassium permanganate in three minutes being estimated before and after incubation, a higher figure after incubation points to the fact that putrefaction has taken place during the incubation period. It is of interest to note that a fairly good sample void of nitrate may show signs of putrefaction, while a sample far worse, but containing nitrate, would keep, but, of course, at the expense of the nitrate.

(3) *Excess of Lime in Tank Effluent.*—Where lime is used as a precipitant, the estimation of the caustic alkalinity of the tank effluent is of great value, as not only does it prevent waste of lime, but also prevents a liquid being obtained from the tanks which is capable of dissolving organic matter, and consequently further taxing the filters. An excess of lime in the tank effluent also encourages an objectionable grey growth on top of the filters. On the other hand, a slight trace is, no doubt, helpful for nitrification, as it furnishes a base for the nitric acid formed.

The author has given an all too brief description of the tests and estimations usually carried out in a sewage works laboratory, and in conclusion he would advise those who would go more deeply into the matter to study some of the recognised text-books on sewage analysis, which include a description of other tests not mentioned—such as the estimation of iron, fatty matter, sulphur compounds, &c.

Cudworth Councillors and Conference Expenses.—The Local Government Board wrote to the Cudworth Urban District Council sanctioning the payment of the reasonable expenses "of the surveyor or other officer of the council concerned with the housing and town planning question and one other delegate" attending the proposed conference at Leeds. The council had in the first place decided to send three members to the conference, and it was felt they should not be represented at all on the conditions proposed by the Local Government Board. It was therefore decided by five votes to four not to be represented at the conference.

Public Health Law.—This concise little work* has been prepared mainly for the use of all concerned in local government work who may find the larger books too elaborate. In twenty chapters it covers the ground sufficiently for its purpose, including such matters as highways, but omitting rating, elections, &c. For students it should be of assistance in preparing for examinations in Public Health Law, while the practitioner will find its arrangements well suited for easy reference.—*The Law Times.*

The Value of Mechanical Filters in the Purification of Water.

ROYAL SANITARY INSTITUTE DISCUSSION AT SHREWSBURY.

There was a very large attendance at the recent meeting of the Royal Sanitary Institute at Shrewsbury, at which Dr. Thomas Orr, the medical officer of health of that town, opened a discussion on the value of the mechanical filtration of water. The chair was taken by Mr. H. Percy Boulnois, M.INST.C.E., Westminster, who, in introducing Dr. Orr, commented on the interest of the subject.

Mr. Martin Deacon (London) said that Dr. Orr, in his most interesting paper,* had dealt fully with the efficiency of the mechanical filter under varying conditions. He had touched upon the capital cost, the cost of treatment and maintenance, and he had drawn comparisons between the mechanical process and that of the ordinary slow sand bed process. With regard, firstly, to the capital cost, he (Mr. Deacon) was of opinion that some of the figures which are published, and statements which are frequently made as to the capital cost per 1,000,000 gallons of the mechanical process, are most misleading. Mr. John Don, in his paper read before the Institution of Mechanical Engineers in 1909, included a table purporting to show the capital cost per 1,000,000 gallons of the various makes of mechanical filters, and he added a note at the foot of the table to the effect that "the figures may be taken as substantially correct, as they are provided by the proprietors of the various makes." So far as the manufacturers were concerned these figures, varying between £2,100 and £2,800 per 1,000,000 gallons, might be correct, but the engineer finds it necessary to call for many articles which are not included by the manufacturers, but which, in his opinion, are necessary in order that the process may approach the safety and efficiency of that of the slow sand bed. Dr. Orr had said that one of the advantages of the mechanical process was that the plant was under cover. The cost of that cover, consisting of a building, must be included; and Mr. Deacon was of opinion that the capital cost varied between £4,000 and £6,000 per 1,000,000 gallons. Even with these increased figures there was a considerable saving over the capital cost of the slow sand bed process, which might vary between £8,000 and £10,000 per 1,000,000 gallons, according to the particular locality. He ventured to think that it was this saving in capital cost which had been responsible for the introduction of many of the mechanical plants which have been installed in this country, but where investigation had shown, after a period of running, that the annual cost to the authority was actually greater than would have been the case had the slow sand bed process been introduced. Taking everything into consideration, he had come to the conclusion that, whereas the mechanical process was about half the capital cost per 1,000,000 gallons of the slow sand bed process, the cost of maintenance and treatment was about double. Dr. Orr, on page 16 of his paper, had quoted figures of the cost of maintenance and treatment both of the slow sand bed process and of the mechanical process, and for the former he gave 12s. 11d. per 1,000,000 gallons. The late Mr. W. B. Bryan might certainly be taken as an authority of great experience on this subject, and he had given 6s. per 1,000,000 gallons; and we to-day in this country were doing the work at 4s. 2d. per 1,000,000 gallons, as compared with 12s. 11d. as quoted by Dr. Orr. He (Mr. Deacon) pointed out that a plant of mechanical filters had been installed to deal with close on 3,000,000 gallons a day. In an almost adjacent valley, with a similar water from the same range of hills, the late Dr. Deacon constructed slow sand beds. The capital cost of the mechanical plant was £5,730 per 1,000,000 gallons, and of the slow sand beds £9,000 per 1,000,000 gallons. Adding the repayment of the loan on the mechanical plant at 4 per cent over thirty years to the annual cost of treatment and maintenance, the annual cost per 1,000,000 gallons is £50; while adding the repayment of the loan on the slow sand bed scheme at 4 per cent over sixty years to the annual cost of treatment and maintenance, the annual cost per 1,000,000 gallons was £464. These two systems were introduced among other things to prevent plumbo-solvent action, and he notes from the paper that Dr. Orr came to the conclusion that the mechanical filter process was the proper one for this purpose, but Mr. Deacon entirely disagreed with this conclusion. Dr. Deacon added crushed limestone to the millstone grit sand, and though the raw water dissolved 17·4 parts of lead per 1,000,000 gallons, the filtered water was alkaline. Not only was the slow sand bed process cheaper per annum, but it had the advantage that the beds were washed at intervals of only from three to six weeks, whereas the mechanical plant was washed every two or three days. There is no doubt that, while it lasted, the efficiency of the mechanical filter compared favourably with the slow sand bed, provided the process was carefully supervised, but in his opinion the design of the mechanical filter was engineeringly bad. Any machine was bad which, very soon after arriving at its highest efficiency, had to be stopped and thrown out of action at very frequent intervals. He put forward a suggestion to the manufacturers that his machine would be infinitely more valuable if some form of roughing plant were introduced, thus prolonging the life of the final bed. He was of opinion that for the removal of peat stain the mechanical filter was necessary, as it was the only economical means of introducing a coagulant which was required for the complete removal of the colour, and where the frequency of the washing of the sand was not serious. Mr. Boulnois had asked him to say a word on the Ransome filter, and he did so because it introduced an entirely novel condition. The Ransome filter was in no sense of the word a mechanical filter, there being none of the apparatus necessary which gave the name "mechanical" to the pressure type of filter. It was a pressure or gravity filter with a portion of the sand kept continuously in motion, and through which the water passed as a roughing filter before passing through the stationary and final bed of sand underneath the moving sand. The removal of bacteria and peat stain had been shown to be most extraordinarily good, and the fact that moving sand was used threw doubts upon the generally accepted theory that a surface film was required for the efficient treatment of the water, for in the moving sand no permanent film was formed. The effect of the moving sand, which carried away a very large proportion of the impurities, was to reduce the number of washings to from thirty to forty per annum, as compared with from 300 upwards when the sand had been kept stationary, and at the same time, no doubt owing to the preliminary roughing, the efficiency was exceptionally high.

Alderman Meeson Morris, chairman of the Shrewsbury Sanitary Committee, said that in 1909 he was instrumental in bringing their council to lay down Bell's pressure filters for dealing with the Severn water at that town, and he claimed they had given full satisfaction, and that the council had been amply justified in the step they took. Looking at the matter from a practical standpoint, one of the most striking results of their use of these filters was that, whereas up to 1909 they were never without a high percentage of enteric fever cases in the borough, since the laying down of these filters they had not had a single case of enteric that had originated in the town.

Dr. S. Rideal (London) said he had seen the mechanical filters at Shrewsbury some years ago, and at his suggestion the chlorine treatment had been adopted in order further to improve the bacterial quality of the river Severn water. This river, throughout its course, formed a most interesting hydrographical study, as it consisted of waters with nearly all characteristics, and yet it was amenable to treatment, and formed the drinking supply of several communities living on its banks. At Shrewsbury, at certain times of the year, it consisted largely of the dark peaty water which came down the river Vyrnwy, and this again, it was interesting to note, was largely made up of compensation water from the Liverpool reservoir. This compensation water came from the bottom of the Vyrnwy reservoir, and was so dark coloured and void of oxygen that it might be regarded as the rejected water of Liverpool, and yet by the mechanical filters, alum treatment, and chlorine sterilisation, Shrewsbury had successfully converted it into a very excellent water which he, for one, would

* See last week's Surveyor.

not hesitate to use for all purposes. The Local Government Board were undoubtedly justified in the past in regarding river supplies with suspicion, but the old-fashioned open sand filters which were so generally used in this country, and notably in the case of London with its Thames and Lea derived waters, had been shown by Dr. Houston and others to fail in producing a sterile water, or one in which every dangerous water-borne organism was eliminated, and they had seen during the past fifteen years that the large storage reservoirs required primarily for quantity requirements had in addition a remarkable quality characteristic, so that the combination of long storage of two months or more in the case of the polluted Thames, plus the open sand filters, had so far kept the London water supply up to bacterial standards of purity. The mechanical filters might at times give a percentage purification as good as an open sand filter, especially when a carefully adjusted alum coagulant was used, but percentage purification figures were misleading, as the subject of water purification must be to limit the number of chances of bacterial contamination in the finished water, and he believed by chlorine sterilisation after mechanical filtration a better and more certain result could be obtained than by the alternative of prolonged storage plus ordinary sand filtration. He wished to emphasise the point that mechanical filters were able to deal with waters of a very variable character, and he ventured to think that the removal of iron, the prevention of plumbism, and the precipitation of peat-colouring matter could all be undoubtedly effected better by a well-regulated mechanical filter than in any other way. By chlorine addition we had now a further powerful weapon, which in America was now very generally used, and could be simply adjusted to the draught or pumping capacity in such a way as to prevent any unpleasant taste to the water and yet ensure a bacterial purity hitherto unattainable by open sand filters. The attempt to find pure water in Nature had been very costly. During the Boer War Dr. Parkes and himself suggested a sterilising tablet for use against typhoid in South African waters, and now in Flanders our troops were provided with a mechanical filter, followed by a bleaching-powder treatment practically the same as in use at Shrewsbury. Only that day he had been consulted with regard to a sewage from a large military camp in England which it was proposed to discharge into a river which joined the water supply of one of our large towns which he thought was the very first to adopt a mechanical filter for treatment of river water in England, and it would be interesting to see how it dealt with this suggested new pollution.

Mr. LEAN, engineer to the Truro Waterworks Company, gave his experience there with the Candy filter, and said when once the public had got rid of the objection to the chemical process it would solve the great difficulty of getting an absolutely pure supply, and enable small water companies and small municipal authorities to obtain one of the best methods of dealing with the water yet known.

Mr. F. PARR, borough surveyor of Bridgwater, said he had advised his authority to go in for a treatment of the water supply of that town by some mechanical filtration scheme.

Mr. F. PULLEN CANDY (London) said that the Candy filter which Dr. Orr had described in his paper was the type known as the "packed" filter, such as was largely used for removing iron from water, and it was not the type of filter specifically made for removing bacteria. In addition to the "packed" type, Candy filters were made with a loose bed of sand cleaned by a reversed flow of water, plus a scouring system, and this was the type of filter recommended when chemical treatment was employed. In connection with this type of filter there was no doubt that better bacteriological results could be obtained when coagulants were used than when coagulants were not used. Mr. Martin Deacon had mentioned in his remarks that water engineers would look with favour upon a mechanical filter which combined a pre-filter. The Candy Filter Company made such a filter, which was known as the "Compound" filter, and in this a separate bed of coarse material was provided through which the water was filtered before passing on to the fine bed. As Mr. Martin Deacon said, such a filter would cost a little more than the ordinary type, but it had a very great advantage in dealing with thick water. With regard to the question of the employment of chlorine to ensure a perfectly safe drinking water, the speaker did not agree with Dr. Orr that the chlorine treatment had not had a sufficient trial; he would instance Reading, Truro, and Teignmouth as places where the Declor system had been in operation for several years with most satisfactory and gratifying results. The War Office has also adopted the Declor system for several large installations in this country to produce safe drinking water for the troops. As regarded the amount of chlorine added to the water, 1 part in 2,000,000 parts of water, such as Dr. Orr told them was used at Shrewsbury, was a very small quantity for such a water. They (the Candy Filter Company) had had very considerable experience in dealing with large quantities of water by chlorine treatment, and in some instances they found that at times as much as 6 parts of chlorine to the 1,000,000 was necessary. It was a great advantage of the Declor process that the free chlorine after doing its work was removed by an insoluble material, so that there was no necessity with that process to cut the quantity of free chlorine down to so minute an amount as to endanger its powers of absolutely destroying the bacillus coli and the typhoid bacillus.

Mr. DIXON (Ashton-under-Lyne) expressed himself as a firm advocate of the mechanical filter.

Mr. WALBURGH WARD, borough surveyor of Shrewsbury, said that in his judgment mechanical filters were worked at too high a rate. A slower rate of working would not only increase their efficiency, but extend the life of the filter, and make the washing process less frequently necessary.

Mr. LASSEN said he might allude to two points in the paper to which allusion might perhaps be permitted from a standpoint not hitherto referred to—he meant the removal of iron from water, and the after-treatment of chlorinated water by means of filtration through a bed of manganese "permutit." When treated by manganese chloride, and subsequently with potassium permanganate, ordinary artificially made sodium "permutit" exchanged its base for manganese, and then acquired a capacity for holding a very high oxide of manganese in such condition as to present it most efficiently to any body of water flowing through the material. By this means the iron in the water was oxidised and thrown out into suspension completely. The action of this artificial oxidising agent was much more intense than that of any filtering medium previously known, and it would therefore be appreciated (and had been demonstrated in large commercial plants) that there existed in manganese "permutit," at the disposal of the water engineer, a means for rapidly and efficiently freeing iron-contaminated supplies from iron in solution by means of a plant which was compact and extremely simple in its operation. Not only was the oxidising action referred to of a very intense activity, but the mechanical filtering power of the "permutit" itself was above that of other accepted media. The second point, which was influenced by the activity of manganese "permutit" for abstracting iron out of a water supply was that of bacteriological purification by means of chlorine. Dr. Orr had put before the meeting some interesting figures in this connection, and these were further supported by investigations which had been carried out by public authorities both in this country and in France. Using sodium-hypochlorite upon crude Thames water and upon crude Seine water without any pre-filtration, it had been found possible to render both these waters absolutely safe for drinking purposes by means of this treatment. The chief point, however, to which he should like to draw attention was the fact that chlorination was only effective by reason of the oxygen which it set free, and therefore abstracted from the water, and to that extent, therefore, the water was flattened and its palatability very materially damaged. The research work referred to had shown that my means of final filtration through a bed of manganese "permutit," not only could filtration of all excess chlorine be carried out by ferrous sulphate in excess, but the water again raised to a state of oxygenation as high—or higher—than that of the crude. By means of manganese "permutit," therefore, chlorination of a contaminated supply could be effected with the certainty that all traces of excess chlorine could be removed, irrespective of the use of a dose greater than that necessary to sterilise. Experiments conducted upon river water contaminated to a point represented by the presence of B.coli in 0·01 of a c.c., showed that without any pre-filtration this water could, after chlorination, subsequent dechlorination with ferrous sulphate and final filtration through manganese "permutit," be delivered crystal clear, of a faint bluish-white tinge, and entirely free of traces of chlorine or iron. Sterilisation was so complete as to give negative results in the test for B.coli in 400 c.c.'s,

while bacteria which in the crude water numbered 8,650 per c.c., were reduced in the treated water in six tests respectively to 38, 56, 37, 26, 46, and 27. In all cases seventy-two hours' incubation was allowed.

The Chairman (Mr. H. Percy Boulnois), in closing the discussion, said if it had not been for Mr. Deacon it would have been a pæan of praise for the pressure filter. There were conditions in which pressure filters might be used, and conditions in which ordinary gravity filters might be used. Dr. Rideal had said it was a chemical age. He (Mr. Boulnois) called it an age of hurry. They were all in a hurry to get things done, and, to paraphrase an old saying, they might "Filter in haste and repent at leisure." He proposed a very hearty vote of thanks to Dr. Orr for his paper, and for acting as honorary secretary for that meeting, and thanks to the Mayor and Corporation of Shrewsbury for the use of their Guildhall.

The motion was carried with acclamation.

Dr. Orr, in reply, said as regards Mr. Deacon's remarks he thought it would be advisable to have the details of all the costs he had given before them, so that they go into them carefully, because as he (Dr. Orr) made it out, the cost was far and away in favour of mechanical filters.

The members met at the Guildhall on the following morning in beautiful weather, and had an enjoyable visit to the housing scheme of the borough at Ditherington, proceeding afterwards to inspect the mechanical filters and the public abattoir.

At one o'clock the Mayor of Shrewsbury, Alderman Maynard How, received the members at a reception in the beautiful Speech Hall of the secondary school of the borough. Luncheon followed, his Worship being supported by Mr. H. Percy Boulnois; the chairman of the Salop County Council, Sir J. Bowen Bowen-Jones, Bart.; and a number of the members of the Shrewsbury Corporation, including the chairman of the Sanitary Committee, Alderman Meeson Morris; and the chairman of the Water Committee, Councillor Grocott. Among others present were Mr. G. Butler Lloyd, M.P. for Shrewsbury; the clerk to the Salop County Council, Mr. Frederick Crowte; and the town clerk, Mr. R. F. Prideaux.

Following the toast of the King,

Mr. Boulnois, amid applause, said it was his pleasing duty to propose the health of their host, Alderman Maynard How. They of the Royal Sanitary Institute had had on that occasion a record meeting. They had had an exceedingly good gathering on the previous night, and an exceedingly interesting discussion on Dr. Orr's paper; and although there were more advocates of the mechanical filters than of the gravity system, the discussion was of great value, and he, old as he was, had learned a great deal. The Royal Sanitary Institute had been in existence for a great number of years, and was almost a unique society, because it embraced so many different professions. It had among its members a great many medical officers of health, architects, engineers, and scientists, as well as laymen, and he ventured to say that the work of the institute had done a great deal toward ameliorating the condition of the people. That morning they had looked at a great deal of interesting work in Shrewsbury, beginning with their housing scheme. He himself, when city engineer of Liverpool, took a considerable interest in the housing question, and he thought that Shrewsbury had done the right thing in erecting houses such as they had at rentals of 5s. 6d. a week. They were admirable cottages, and he personally would not mind living in one himself. Then again at the filter works Shrewsbury had done a wonderful work. The water of the Severn was not above suspicion, and he might say that when he was deputy chief engineering inspector of the Local Government Board Shrewsbury gave them a great deal of thought. Shrewsbury hitherto had been celebrated for two things—one, as having been the birthplace of Darwin; and two, for its cakes. Now he thought it had another great claim, inasmuch it was the one town that had defeated the Local Government Board. They heard the previous night that the water supply of Shrewsbury was absolutely above suspicion, although it came from a suspected river, and that enteric fever had diminished to such an extent that there was now no cases in the town—that was an extraordinary record. Mr. Boulnois, concluding, said, as respecting the Sanitary Institute, he had to thank the mayor for his hospitality in that charming hall, and he asked them to drink the health of his Worship.

The toast was received with acclamation.

The Mayor, in reply, said he was grateful to Mr. Boulnois for his graceful thanks, and also for the very interesting speech he had made. In regard to what he had said of the Local Government Board, if Mr. Boulnois were still there he would suggest to him that at a time like this, when we were all seeking to act in unity, that board might do well to bury the hatchet, for he believed they had never quite forgiven Shrewsbury. The mayor, continuing, said it was a pleasure to him to be there, and first he wished to welcome the Royal Sanitary Institute, and say how much pleasure he had had in being able to entertain them.

PHILADELPHIA SEWAGE SCHEME.

HUGE OUTLAY PROPOSED.

Containing recommendations for work involving an expenditure of £6,900,000 to meet conditions in the year 1950, the final report of the Bureau of Surveys on the comprehensive plan for the collection, treatment and disposal of the sewage of Philadelphia was, an American exchange states, submitted to the city council recently. The project is on such a large scale that it is possible at this time to give only a bare outline of its main features.

Sewage collected by the city's present system will be intercepted and conveyed by transverse collectors to three sites where treatment works will be installed —one on the Delaware River for the northern part of the city, one on the Delaware River for the southeastern part, and the third at the mouth of the Schuylkill for the central and western parts.

The first method of sewage treatment recommended at the north-east and south-west works involves coarse screens, grit chambers, and two-story sedimentation tanks of the Imhoff type. As the volume of river water available for the assimilation of the effluent of the works remains practically the same, while the volume of sewage produced by the city steadily increases, due to growth in population, it may be necessary in the future to compensate for this increase in the amount of sewage by more refined treatment, which will probably consist in the oxidation of the tank effluent in percolating filters, or by such other methods as may be approved at that time.

The treatment of the sewage carried to the south-east works will consist of coarse screens, grit chambers and fine screens. The effluents of the proposed works will be disposed of by diffusion in the Delaware River through submerged outfalls so located that the treated sewage will be rapidly distributed in the great tidal flow, thus utilising to the fullest extent the oxidising power of the river.

A definite programme has been arranged for the expenditure of the funds on the proposed system. There is needed immediately an appropriation of £1,000,000 for the purchase of land at the sites of the three proposed treatment works, for the construction of collecting sewers, and for the construction of sewage treatment works at the north-east site. These works will protect the Delaware River in the vicinity of the source of the city's water supply.

It is recommended that subsequent appropriations should be made as rapidly as possible for the construction of the collecting sewers, pumping stations, treatment works, and appurtenances generally.

It is also recommended that there should be co-operation between the states of Pennsylvania and New Jersey, so as to secure concordant action for the treatment of the sewage of communities in these States, which is discharged into the Delaware River or its tributaries.

Bourne's New Isolation Hospital.—An isolation hospital built by the Bourne Rural District Council on the main road to Peterborough at a total of over £6,000, was formally opened last week.

New Park and Recreation Ground at York.—A new park and children's recreation ground, to be known as Glen Gardens, Heworth, in the Monk Ward, York, was publicly opened last week. The estate, which comprises 8½ acres, was purchased in 1911 by the corporation for £3,000, the owner foregoing its real value on the condition that it was dedicated as an open space for ever. Since then some £1,800 has been spent in laying it out. There is a full-sized bowling green, four tennis courts, and a promenade, with shrubberies which occupy 3 acres. The remainder consists of two playing fields, one for young children, and one for older children. A well-built pavilion, in the Old English half-timbered style, is also provided.

THE PROVISION OF SANATORIA.

A MIDDLESEX COUNTY COUNCIL SCHEME.

In the House of Commons on Monday the President of the Local Government Board was asked whether, in connection with the proposed building of a sanatorium by the Middlesex County Council at Mayfield, Essex, he is aware that since the outbreak of war the council have decided that, while completing the purchase of the site, it was not desirable to apply for the consent of the board to borrow a large sum of public money for the building, or to apply to the Public Works Loan Commissioners for a loan, owing to the public in competition with the Treasury at a time like the present, when the whole resources of the country are urgently required to be husbanded or employed for the vigorous prosecution of the war in order to bring about its speedy conclusion; and whether such course has received his sanction.

The President of the Local Government Board (Mr. Walter Long) said he was aware of the resolutions passed by the county council at their meetings in January and May last. No sanction on his part was required in the circumstances described in the question; but if the hon. Member wished to know whether he thought that arrangements of the kind should be postponed in the present circumstances, he could inform him that he did.

Coast Sand Dunes, Sand Spits, and Sand Wastes. (By G. G. Case. Price 4s. St. Bride's Press, Limited, 24 Bride-lane, E.C.). . . . "A most useful little book crammed with facts culled from all parts of the world and well illustrated with photographic reproductions and diagrams. Numerous references to other works are given. Mr. Case discusses the formation and distribution of sand dunes and the devastation caused by them when they move inland, and then goes on to consider protective works and the reclamation of sand wastes. If we have one criticism to offer it is that the book is too condensed. There is certainly not a superfluous paragraph."—*Geographical Journal.*

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

EAST MIDLAND DISTRICT.

A meeting of the institution will be held in the East Midland District at the Town Hall, Matlock, to-morrow (Saturday, June 12th).

PROGRAMME.

11.30 a.m.—Assemble in the Town Hall, Matlock, where the members and visitors will be received by the chairman (Mr. D. M. Wildgoose, J.P.) and members of the Matlock Urban District Council.

11.45 a.m.—A short paper on Matlock will probably be read, but has not yet been arranged.

12.15 p.m.—Visit pleasure grounds and cable tramway.

1 p.m.—Luncheon at the Crown Hotel. (Tickets, 2s. each.)

2.15 p.m.—Drive to the new sewage disposal works, where a description of the same will be given by a representative of the firm of Messrs. J. Diggle & Sons, the engineers for the scheme.

3.30 p.m.—Leave sewage works, and proceed to Messrs. Smedley's hydropathic establishment to inspect baths, &c.

4.45 p.m.—Afternoon tea will be provided here by the kind invitation of the directors of Messrs. Smedley's.

6.15 p.m.—Arrive at the town hall.

(Conveyance tickets, 1s. 3d. each.)

E. H. Crump, Assoc.M.Inst.C.E.,
Hon. District Secretary.

Hinckley.

ANNUAL GENERAL MEETING.

The forty-second annual general meeting of the institution will be held at the Institution of Civil Engineers, Great George-street, Westminster, on Thursday and Friday, June 24th and 25th, followed by visits on Saturday, June 26th.

[The full programme will be found in The Surveyor of June 4th.]

J. W. Dudley Robinson,
Secretary.

INSTITUTION OF WATER ENGINEERS.

TWENTIETH SUMMER GENERAL MEETING.

The twentieth summer general meeting of the Institution of Water Engineers will be held at the apartments of the Geological Society of London, Burlington House, W. (kindly lent for that purpose by the president and council of that body), on Friday, June 18th, commencing at 3 p.m.

The following papers will be read and discussed:—

(1) "The Effect of Springs upon Water-levels in the Chalk of Eastern Surrey," by Henry Dewey, F.G.S. (H.M. Geological Survey).

(2) "The Hydro-Geological Conditions of Newbald, East Yorkshire," by Percy Griffith, M.Inst.C.E., F.G.S.

PROGRAMME.

The chair will be taken by the retiring president (Mr. Thomas Molyneux), and the minutes of the nineteenth winter general meeting, held in London on December 11, 1914, will be read and put for confirmation.

The names of members, &c., elected since the last general meeting will be announced, and those present will be welcomed by the president.

Introduction of the new president (Mr. F. W. McCullough, M.Inst.C.E., J.P.), and presentation of certificate of election.

Vote of thanks to retiring president.

The new president will present a short report upon the work of the institution during the past year.

Reading and discussion of papers.

ROYAL SANITARY INSTITUTE.

YEOVIL MEETING.

At Yeovil, on July 14th, a discussion on "Water Supplies to Rural and Small Urban Areas" will be opened by Dr. W. G. Savage, county medical officer of health of Somerset.

Fire Tests with Fire Extinguishers. The Pyrene fire extinguisher, which takes the form of a double-action hand squirt containing a quart of chemical of the carbon tetrachloride class has recently been tested by the British Fire Prevention Committee, who have now issued their report (No. 189). The testers notified the committee that their appliance was not suitable for the ordinary fire tests with loose, inflammable materials, as required under the committee's standard for ordinary extinguishers. These, as a rule, comprise the ordinary burning crate, packing cases, burning logs, and so forth. The tests that were undertaken were the easier part of the committee's series of petrol tests—*i.e.*, those with small quantities of petrol over a limited area—and the summary of the report indicates that the extinguisher is able to deal with such miniature fires of limited area if the quantity of spirit is kept within 2 gallons. There were also some tests with small quantities of certain chemicals, and it was shown that the appliance was efficient for small celluloid fires with films up to a length not exceeding 100 ft. In other words, this appliance is primarily useful for small spirit fires as met with in motor-car work, &c., but is in no way applicable to ordinary fires. A weak spot regarding the appliance is the pungent smoke it generates when applied to fire, that makes it inconvenient for use indoors. Hydrochloric acid is apparently generated, and the fumes of which are of an acrid character affecting the operator. Thus, generally speaking, this appliance has limited uses which must not be confused with general uses.

APPOINTMENTS VACANT.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* WEDNESDAYS *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

GAS ENGINEER.—June 12th.—Stoke-on-Trent Corporation. £500—£700 per annum.—Mr. E. B. Sharpley, town clerk.

BOROUGH SURVEYOR.—June 12th.—Corporation of Wenlock. £200 per annum.—Mr. F. H. Potts, town clerk.

BOROUGH ENGINEER AND SURVEYOR.—June 14th.—Woolwich Borough Council. £500—£650.—Mr. Arthur B. Bryceson, town clerk.

INSPECTOR OF NUISANCES.—June 14th.—Colwyn Bay Urban District Council. £150 per annum.—Mr. J. Amphlett, clerk.

BURGH SURVEYOR.—June 16th.—Inverness Town Council. £250 a year.—Mr. K. Macdonald, town clerk.

ROAD SURVEYOR.—June 17th.—Forfar District Committee of the Forfarshire County Council. £300, with £50 for travelling expenses.—Mr. J. P. Anderson, district clerk, Municipal Buildings, Forfar.

DISTRICT SURVEYORS (2).—June 18th.—London County Council.—The Clerk, County Hall, Spring-gardens, S.W.

SANITARY INSPECTOR.—June 21st.—Corporation of Mansfield. £100—£140 per annum.—Mr. J. Harrop White, town clerk.

ROAD SURVEYOR.—June 23rd.—Denbighshire County Council. £100 per annum, with travelling expenses.—Mr. W. R. Evans, clerk, County Offices, Ruthin.

TEMPORARY CLERK.—Corporation of Cheltenham.—Borough Engineer, Municipal Offices, Cheltenham.

SANITARY INSPECTOR.—Finsbury Borough Council. £3 per week.—Medical Officer of Health, Town Hall, Rosebery-avenue, London, E.C.

DRAUGHTSMAN.—Public Works Department, Government of the Gold Coast. £250—£300.—Crown Agents for the Colonies, Whitehall-gardens, London, S.W.

ASSISTANT ENGINEERS.—Public Works Department, Government of the Gold Coast. £350—£400.—Crown Agents for the Colonies, Whitehall-gardens, London, S.W.

MUNICIPAL CONTRACTS OPEN.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* WEDNESDAYS *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

Buildings.

GLAMORGAN.—June 12th.—For repairs and alterations to schools, for the county council.—Mr. T. Mansel-Franklen, clerk, County Hall, Cardiff.

WEST SUFFOLK.—June 14th.—For repairs at certain schools, for the Education Committee.—Mr. A. A. Hunt, county architect, 51 Abbeygate-street, Bury St. Edmunds.

CREWE.—June 15th.—For the erection of three cottages, for the corporation.—Mr. G. Eaton-Shore, borough surveyor.

GREENOCK.—June 15th.—For the erection of 150 houses, for the corporation.—Office of Public Works, Municipal Buildings.

ALNWICK.—June 17th.—For additions to the public slaughter-house, for the urban district council.—The Slaughter-house Committee.

FAILSWORTH.—June 18th.—For converting privy-closets into water-closets, for the urban district council.—Mr. W. M. Shimmin, engineer and surveyor, Oldham-road, Failsworth.

BRADFORD.—June 19th.—For the erection of a caretaker's house, for the Education Committee.—City Architect, Town Hall.

EVESHAM.—June 19th.—For additions and alterations to sanatorium, for the Joint Hospital Board.—Mr. H. S. Harvey, architect and surveyor, Town Hall.

CASTLEBAR.—June 19th.—For building four cottages, for the rural district council.—The Clerk.

LEEDS.—June 21st.—For the erection of a two-story building, for the corporation.—Town Clerk.

BLACKPOOL.—June 23rd.—For excavating and underpinning at the electricity works, for the corporation.—Mr. John S. Brodie, borough surveyor.

DURHAM.—June 25th.—For taking down and re-erecting two iron schools, for the Education Committee.—The Clerk, Shire Hall, Durham.

WILTS.—June 25th.—For alterations and repairs to various schools, for the Education Committee.—Mr. J. George Powell, county surveyor, Trowbridge.

LONDON.—June 30th.—For repairs and cleaning works at Homerton Asylum, for the Metropolitan Asylums Board.—Board Offices, Embankment, E.C.

GODALMING.—June 30th.—For the erection of a sanatorium, for the Metropolitan Asylums Board.

ALDERSHOT.—For the re-erection of a temporary hospital. Offers invited from owners of wood or iron buildings.—Mr. F. C. Uren, surveyor.

BOOTLE.—For alterations to school lavatories, for the corporation.—Borough Engineer.

Engineering: Iron and Steel.

HALIFAX.—June 12th.—For the supply and fixing of a hot-water boiler, for the Education Committee.—Mr. J. Lord, borough engineer.

YORK.—June 14th.—For the construction of two 30-in. cast-iron pipe lines, for the corporation.—Mr. F. W. Spurr, city engineer, Guildhall.

PORTHCAWL.—June 14th.—For supplying and laying cast-iron gas mains, including specials, for the urban district council.—Mr. Evan Davies, clerk.

MANCHESTER.—June 15th.—For making embankment watertight, for the Sanitary Committee.—City Architect.

DUMFRIES.—June 15th.—For the supply of steel and ironwork portions of two light-traffic iron girder bridges, for the Thornhill District Committee.—Mr. J. S. Rankin, road surveyor, Waulkmill, Thornhill, Dumfries.

DUBLIN.—June 15th.—For the supply and erection of four Lancashire boilers, for the Office of Public Works.—Mr. H. Williams, secretary.

CASTLEBLAYNEY.—June 16th.—For improvements to the waterworks pipe line, for the rural district council.—Mr. F. Bergin, 36 Westmoreland-street, Dublin.

EAST STOW.—June 16th.—For the construction of a bored well, trial pumping, and other works, for the rural district council.—Messrs. J. Taylor & Sons, engineers, Caxton House, Westminster, S.W.

REIGATE.—June 19th.—For supplying and erecting at the sewage disposal works, Earlswood, one Manlove, Alliott & Co.'s air-compressing plant, for the corporation.—Mr. F. T. Clayton, borough surveyor.

MOTHERWELL.—June 21st.—For excavations in connection with laying of gas mains, for the corporation.—The Gas Engineer, Mill-road, Motherwell.

MAESTEG.—June 21st.—For the construction of a retaining wall, carriageway, footway and four-stall urinal, for the urban district council.—Mr. S. J. Harpur, engineer.

MADRAS.—July 14th.—For the supply of cast-iron pipes, special castings, sluice valves and hydrants, for the corporation.—Mr. J. W. Madeley, special engineer; agents, Messrs. James Mansergh & Sons, 5 Victoria-street, Westminster, London, S.W.

RANGOON.—August 11th.—For the installation of a system of fire alarms, for the municipality.—Messrs. Ogilvy, Gillanders & Co., 67 Cornhill, London, E.C.

Gas and Electricity.

KIRKCALDY.—June 14th.—For the supply of 100 half-watt, 1,000-c.p. lamps and lanterns, for the corporation.—Mr. O. F. Francis, burgh electrical engineer and tramways manager, Electricity Works, Kirkcaldy.

REDDITCH.—June 14th.—For the supply of high-tension three-phase switchboard, for the urban district council.—Messrs. Handcock & Dykes, engineers, 11 Victoria-street, Westminster, S.W.

AYLESBURY.—June 14th.—For the supply of metallic-filament electric lamps, for the urban district council.—The Surveyor.

WEST HAM.—June 14th.—For the installation of the electric light and low-pressure hot-water heating apparatus, for the Education Committee.—Mr. W. Jacques, architect, 2 Fen-street, Fenchurch-street, E.C.

STOURBRIDGE.—June 15th.—For the supply of an exhauster, for the Gas Committee.—Mr. C. H. Webb, engineer and manager, Gasworks.

EDINBURGH.—June 21st.—For the supply of two 5,000-kw. turbo-alternators and condensing plant, for the corporation.—The Engineer, Dewar-place, Edinburgh.

Roads.

TIPPERARY.—June 12th.—For the supply of four 6-ton end-tipping wagons, for the county council.—County Surveyor, Court House, Nenagh.

The Surveyor

And Municipal and County Engineer.

Vol. XLVII. JUNE 18, 1915. No. 1,222.

Minutes of Proceedings.

The Cleaning and Life of Water Mains.

The true engineer should differ from the amateur engineer in the fact that he is dealing with a wider outlook. The knowledge of the amateur being limited, though sometimes quite correct and exact, is apt to lead him to erroneous conclusions, and the danger of his possessing control or deciding matters of engineering policy is sufficiently obvious. The engineer is only too often hampered by being obliged to give attention to the suggestions, recommendations, and instructions of his council, board of directors or clients, in matters of which they may possess limited and knowledge, but, nevertheless, knowledge of a character so limited that it produces a distortion of view that is most harmful. This distortion of view is, moreover, sometimes possessed by engineers who, being impressed by the merits of a certain system or line of policy, become advocates and special pleaders for that system, ignoring the fact that other methods or lines of policy have merits which make them applicable under certain conditions. To advocate main scraping in all cases would be the act of a person of incomplete knowledge, valuable as the process has proved itself in many districts. It is essential that the engineer should be entirely unprejudiced, and that having studied all possible methods he shall be able to judge each case on its merits. The tendency to reduce engineering work to a system has its application to the work of the manufacturer rather than to that of the civil engineer, and one ought not to expect the same breadth of view from the manufacturer as from the civil engineer. The manufacturer having produced a certain thing is naturally chiefly concerned with its sale. He naturally wishes to put forward his appliances wherever they will meet requirements; he certainly cannot be expected to advise the installation of appliances made by somebody else, and still less should he be expected to suggest some method by which the installation of plant is rendered unnecessary.

The cleaning of water mains is a case in point. Scraping appliances are being used with increasing frequency—sometimes wisely and sometimes unwisely. The incrustation and clogging of mains is due to many causes, and though in some cases scraping will be attended with the most beneficial results, in others there is risk and practical certainty of trouble. For instance, if the water is of such a quality as to corrode the mains the removal of iron rust and nodules will leave the surface exposed to further corrosion, which will not only lead again to the rapid incrustation of the interior surface, but will ultimately lead to the failure of the main. If such a main is cleaned it would be well for the engineer to remember at the same time that it is possible to treat corrosive water so that it will no longer attack the iron pipe. Or, again, with a hard water depositing lime in the main, scraping will give the main its lost capacity, but it will not prevent future trouble from incrustation. Here, again, the engineer would do well to consider the desirability of adopting some treatment which will prevent the deposition of lime. It is entirely wrong to imagine that there is any one and simple method by which the water engineer may get rid of water main troubles: the practice of the water engineer cannot be reduced to a system. What will be of the greatest value in one case may be absolutely useless in another. As an example, the double dipping of pipes for coating may be very valuable when the water is corrosive, and it may, under certain conditions, be better to rely upon efficient coating of the pipes than upon treatment of the water: but of what use is double dipping in Angus Smith's solution, or of any coating where the pipes are rapidly coated with lime owing to the quality of the water? It is sheer waste of money.

The paper which we publish elsewhere in these pages, entitled "Pressure-scraping of 15 miles of Water Mains," by Mr. James Macfadzean, the assistant burgh engineer at Ayr, deals with the subject in the broad-minded manner which is to be desired, and, moreover, the reading of the paper was followed by a discussion worthy of the subject. A great deal of very valuable information and evidence is given, which indicates the manner in which the practice of main scraping is being adopted in this country, but the author is very emphatic in stating that "each supply has its own problem, which must be treated by itself, and for whose proper solution the chemist should be associated with the engineer." This is the true spirit in which the modern engineer should work, and it is incontestible that the fullest general and technical knowledge, combined with the highest scientific ability, are required if our new pipe lines are to be laid and dealt with in the most economical and satisfactory manner, and if the existing pipe lines are to be satisfactorily and economically maintained. Loss of capacity can be restored, and clogging and incrustation prevented, and the metal of the pipes preserved if each problem is dealt with properly on its own merits; but in

considering the various possibilities, the possibilities of water treatment, of main cleaning, of protective coating and quality of metal are but a few of the considerations upon which practice should be based.

* * *

Town Planning in Scotland.

At the recent meeting of the Institution of Municipal and County Engineers at Ayr the president paid a well-deserved tribute to the excellence of the paper on "Suggested Town Planning Details for Scottish Conditions," contributed by Mr. John Bryce, M.INST.C.E., of the Glasgow Office of Public Works. The paper was really the outcome of the author's conviction that the Scottish Local Government Board are not likely to exercise the power which they possess under the Act of 1909 of prescribing a set of general provisions for dealing with the matters set out in the fourth schedule of the Act. This omission is not referred to by way of criticism, for until the experience of the actual working of some schemes has been obtained, it would be practically impossible to evolve provisions which would be applicable to various classes of area; but pending the issue of regulations, local authorities will have to formulate provisions for themselves—a task which will be considerably facilitated by a perusal of Mr. Bryce's paper. Dealing in the first place with the minimum width of subsidiary roads, Mr. Bryce pointed out that one of the advantages claimed by the operation of the Housing and Town Planning Act is that it enables authorities to make arrangements with proprietors for the provision of a system of open spaces and wide building lines by bargaining in connection with the cost of road construction. It is necessary, however, that this bargaining should be kept within well-defined limits, for if open spaces and wide building lines are secured as a set-off against narrow and cheaply constructed roads, and without regard to present and probable future traffic requirements, much unnecessary expense will be incurred in time to come. In connection with the width to be allowed between building lines, Mr. Bryce submitted a series of sections showing the amount of sunlight available for varying widths and heights of buildings in streets running east and west. In view of the acknowledged beneficial effect of sunlight on health, it is not surprising to find that this suggestion for widening out the building lines in order to get as much sun as possible was generally endorsed by those who took part in the discussion. Mr. Holmes, of Govan, went a step further, and suggested that builders of tenement houses, especially on northern exposures, should be required to adopt oriel windows for the same purpose. Such windows would serve the double purpose of increasing the amount of available sunshine and breaking an otherwise monotonous elevation.

Mr. Bryce afterwards discussed the minimum percentage for open spaces in dwelling-house areas, and we are quite in agreement with him in taking population as a basis and in advocating recreation grounds of adequate size wherever practicable in preference to a number of ½-acre open spaces dotted about an extensive area. The prevalence of tenement houses in Scotland renders the next point dealt with—namely, the maximum height and character of dwelling-house buildings—of particular importance in that country. There has been a long-standing demand for the abolition as soon as possible of the Scottish system of building long rows of high tenements, every facility for the erection of which is at present afforded by the building laws. It is felt that at least the four-storey tenement should be abolished, and that the extreme height of this class of building should not exceed three storeys. Finally, the paper dealt with the important question of the maximum number of dwelling-houses per acre for various classes of buildings. Having regard to the fact that one of the principal aims of the Housing and Town Planning Act is to reduce as far as possible the number of dwelling-houses which should be built on one acre of ground, the principles on which the maxima are fixed are of vital consequence. Mr. Bryce lays down the following rules as a basis: (1) One-roomed tenements should be abolished, and two-roomed tenements discouraged; (2) tenement houses, if erected, should not exceed three storeys in height; (3) the width between building lines should be not less than suggested in the earlier part of the paper; (4) widths of open space in rear and heights of ceilings should be fixed by statute; and (5) an open space of not less than 2 acres should, if possible, be arranged for every 500 houses.

It was an excellent idea to circulate the paper among the members of the Town Planning Committee for the Scottish District in time for them to make considered contributions to the discussion in writing. These contributions, no less than the paper itself, and the oral discussion, form a valuable addition to the common stock of knowledge in regard to one of the most important questions with which the municipal engineer of the future must be prepared to deal.

Heavy Traffic.—(II.)

In continuation of our remarks last week on the report on heavy traffic prepared at the instance of the County Councils Association, we now propose to examine that part of the document which deals with the amount and distribution of the weight of vehicles. The surveyors consulted are practically unanimous as to the desirability of a greater restriction of weight and of a better distribution of the axle weights. One states that the assumption in the covering letter of the Local Government Board of December 28, 1904, accompanying the Heavy Motor-car Order, that two-thirds of the total weight may generally be assumed to be upon the back axle, is not correct, as the weighing of a number of these vehicles has proved it to be about three-fourths. Another suggests that damage would be considerably decreased if the maximum unit of axle weight were reduced to at least the unit allowed under the Locomotive Act, 1878.

The question of overhanging loads was put to the counties, but there does not seem to be much complaint as to this. Lancashire, however, state that they are frequent, and should be prohibited by law. Leicestershire consider that loads should not be permitted to project beyond the sides of the vehicle. Northants find that, while not frequent, the width and height of loads is sometimes excessive, and consider that a maximum width and height ought to be fixed. Denbighshire point out that chars-à-banc habitually overhang the wheels. Glamorgan consider that the total width should not be allowed to exceed the width of a traction engine. There is no doubt whatever that even the weights allowed at present are very largely exceeded, and, owing to the lack of weighbridges and the difficulty of bringing the cars to those which do exist, there is practically no check upon them. Few local authorities attempt to do more than test their weight when they are registered. In most counties the councils have not at present decided to face the great expense of providing themselves with weighbridges for the purpose of checking weights, and no others appear to be available. The association suggest that a registering authority should have power to weigh any car on any available weighing machine, and this would, of course, apply to railway weighbridges.

Seldom, it seems, have the local authorities been able to recover damages for the injury done

by heavy motors under the head of "extraordinary traffic." It is a matter which is difficult of proof, and the expense of legal proceedings is a great deterrent, especially when the precise legal position is so uncertain as to render it always extremely doubtful whether the authority has a good case. In some instances, however, it has been possible to obtain some compensation by agreement, and the military authorities have also in several instances paid in respect of damage done. Parliamentary Committees are now showing a disposition to insist on clauses in railless traction bills providing for a contribution from the undertaking towards the cost of maintenance of the roads, and the same principle seems likely to be adopted in the case of motor bus companies which requires private bills. In the large majority of cases, however, in which motor omnibuses run over the county roads there are no means of obtaining any contribution from them in respect of the exceptional damage which they do both to the surface and the foundation of all roads, except those which have been specially reconstructed, and it is most strongly urged that funds should be raised from them which would go towards the extra cost of maintenance which they necessitate and also to pay a substantial share of the cost of reconstruction where that is required.

* * *

The Annual Meeting.

Members of the Institution of Municipal and County Engineers will hardly need to be reminded of the annual meeting which takes place on Thursday, Friday and Saturday next week. There is a formidable programme of papers covering a wide variety of subjects—so many indeed that it would appear to be difficult, if not impossible, adequately to discuss them within the very limited time available. The third day will, as usual, be devoted to visits to various works of interest. The first party will be entertained at lunch by the new president, and will proceed to inspect the Kingston sewage disposal works and Canbury Gardens; the second party will be conducted over the Southwark Bridge reconstruction works; while the third party will visit the new underground tube from the General Post Office to Paddington. No doubt many members will remain for the National Road Conference and Exhibition organised by the County Councils Association, which will open on the Friday afternoon, when an address will be delivered by the Right Hon. Walter Long, M.P., the new President of the Local Government Board. The conference will be continued daily from June 28th to July 1st for the discussion of several papers on highway subjects. As these meetings will witness the conclusion of Mr. Pickering's highly successful year of office as president of the institution, we feel that we shall only be fulfilling the wishes of our readers in congratulating him on the distinguished manner in which he has discharged his duties, and the institution on having been once again served so well. The new president is Mr. H. T. Wakelam, the county engineer of Middlesex. Mr. Wakelam's qualifications, both personal and professional, for his new dignity are so well known that it is unnecessary to say more than that members of all grades entrust him with the reins with the fullest confidence that he will more than maintain the high traditions of the institution.

Sanitary Conveniences in Shops.

As is well known, the Government are appealing to shopkeepers to set free all their male staff of enlistable age who are medically fit for service, but it is found in many cases—particularly in small shops where female labour has not as yet been employed and cannot be entirely substituted for male labour—that there is not available on the premises separate sanitary accommodation for the two sexes as required by the Public Health Acts, and it will obviously in such cases involve some hardship to the employer if, having already undergone a measure of sacrifice in releasing his male assistants, he is called upon to incur expense by way of structural alterations to meet conditions which are only intended to be temporary. The requirements of the Acts cannot, of course, be dispensed with, but the Local Government Board believe that in a very large number of cases it will be found possible to meet the difficulty by some temporary arrangement, such as the use, free of charge, of a convenience in a neighbouring house, or of a public convenience near by, which will secure the objects in view without involving the employer in serious additional expense. The board are informed that, in the case of factories and workshops where the same problem has arisen, arrangements of the kind mentioned have been adopted, with the consent or concurrence of the inspector of factories, and have proved quite satisfactory. The board therefore suggest in a circular issued on Monday that councils should instruct their officers to ascertain whether temporary arrangements of the kind indicated can be made in any case in which this difficulty is likely to arise, and generally to administer these provisions, so far as it lies with them, with the view of facilitating the action of any shopkeeper who is willing to allow his male assistants to join the Army. It is pointed out, however, that each case will require to be considered on its merits before a notice is served on an employer, and that, further, it should be made clear to the employer, in each case where temporary outside provision is made, that in the event of his continuing to employ persons of both sexes after the period of the war, he may be called upon to provide the separate accommodation in some more immediately accessible form.

Ripon City Engineer's War Allowance.

A question of good faith which has arisen at the Ripon City Council has, fortunately for the reputation of the corporation, been decided in the only right and proper manner—namely, by the resolve to stand by the bargain made with the city engineer. Still, the fact that the bargain or promise has been called into question is unfortunate, more particularly as it affects the amount of the allowance granted to Mr. Barlow when he joined the Army. We gather from a statement by Alderman Thirlwoy that when the city engineer decided to serve his country in the field it was agreed that half his salary should be paid to him, and that his position should be kept open for him. Most people will agree with the alderman that "it would be dishonourable to withdraw from that." Some there were, however, who appeared to be so indifferent to the city council's honour that they raised the matter in committee, with the result, as appears from a report of the proceedings, that it was resolved not to make any alteration in the allowance. Nothing daunted, they initiated a discussion, at the council meeting, when the report, arguing upon the basis of Mr. Barlow's Army allowance, suggested that they should reduce the amount granted to him to £40. It is common knowledge that the allowance made to an officer cannot be regarded as a financial asset capable of yielding a realisable surplus, and this being so the mayor was hardly justified in asserting that Mr. Barlow's position was bettered by joining the Army. Even if it were, it was neither kind nor encouraging to suggest that it should be made use of to justify the city council in breaking faith with Mr. Barlow. Happily, the members, by a majority of nine to four, refused to have anything to do with such a proposal.

Sydney Ocean Outfall Sewer.

(By a Correspondent.)

A few months hence will witness the completion in Sydney of the largest sewerage undertaking yet attempted in Australia. About five years have already been spent upon the scheme, and when it is finally completed £500,000 will have been spent upon it. The work in question is known as the Southern and Western Suburbs Ocean Outfall Sewer. This sewer will provide for discharging by gravitation into the Pacific Ocean, near Long Bay, the sewage from the southern, western and Illawarra suburbs of Sydney, together with that from a large tract of land, including Botany, lying between Cook's River and the ocean, and south of Coogee.

At the present time practically all the sewage from the above districts is treated at the Botany sewage farm, which is situated on the south side of Cook's River, where the latter enters Botany Bay. This sewage farm, originally determined upon for the purpose of dealing with the southern sewerage system of Sydney, and in 1898 extended to allow of the sewage of the Western suburbs being treated there, has an area of 620 acres, and the system of disposing of the sewage is partly by irrigation and partly by intermittent downward filtration. It is intended that this farm shall be abolished in its entirety when the works now under construction are completed.

The total area dealt with by this new sewer is 38,142 acres, with a population estimated in 1907 at 193,820, and a prospective population of 902,890 persons. The sewer has a total length of 6¼ miles, exclusive of the branch to connect with the existing screening chamber for the sewage from the southern suburbs, and provides for a discharging capacity of 210 cusecs, with a depth of flow of 5 ft. 5 in. at the outfall end. The section varies from 11 ft. 4½ in. by 5 ft. 9 in. to 12 ft. 3 in. by 9 ft., with vertical side walls and slopes 1 in 3½ on the bottom, corners at the junction of the bottom and side walls being rounded off. Concrete, plain or reinforced, has been used throughout, the mixture mostly employed being as follows: Bluestone metal and shivers, measured together, 16 cub. ft. to 8 cub. ft. of sand to 375 lb. of cement, the metal and shivers being mixed in the proportion of 3 parts of 2-in. metal to 2 parts of ¾-in. shivers before gauging. Generally speaking, one gauging was found to give 19½ cub. ft. in situ.

The grade is 1 in 3,650 throughout, and the average flow velocity in feet per second is calculated at 2·21, with a maximum flow of 2·53 ft. per second.

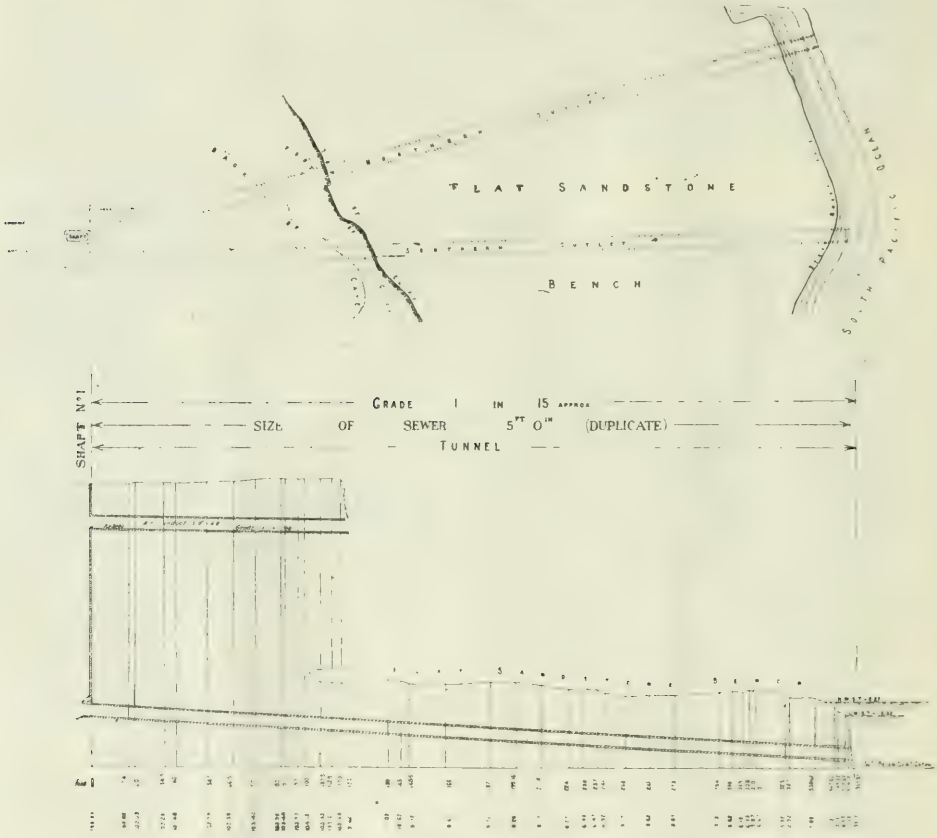

Fig. 1.—Sydney Ocean Outfall.

The sewer has been constructed partly in aqueduct and embankment, partly in open trench, and partly in tunnel through sandstone, and for convenience of the workings was divided into three sections respectively. Section No. 1—the outfall end—was mostly tunnelling through sandstone; section No. 2 was deep trench excavation through water-bearing sand, and section No. 3 was trench excavation, aqueduct and syphon under Cook's River.

Regarding the outfall, advantage was taken of the conformation of the ocean bottom to design the ocean outfall at such a depth below the surface that waves, during an ordinary storm, would not cause interruption to the flow of the sewage. This outfall is subject to the influence only of waves of oscillation, owing to its discharge from a vertical cliff with deep water in front of it (Fig. 1.) This sea cliff is 42 ft. deep, and practically vertical, the top being at the high-water level of spring tide, and the base 37 ft. below the level of

low water. The bottom, for at least ¼ mile seawards, is composed of large rough boulders, swept by the prevailing southerly current, and has a mean depth of about 100 ft. About 250 ft. back from the sea cliff is a land cliff 95 ft. high. This is of hard sandstone, dipping south 70 deg., west about 2 deg., and presents a bold escarpment to the east. Situated some 100 ft. from the land cliff a ventilating shaft was sunk to a depth of 100 ft., at the bottom of which was constructed the outfall chamber. This chamber is 24 ft. in height, 30 ft. wide at its widest part, and 32 ft. in length in the line of the sewer. The size of the main sewer as it enters this chamber is 12 ft. 3 in. wide at springing level, and 7 ft. 6 in. high from invert to soffit. From this chamber the outfall pipes, two in number, are each 5 ft. in diameter, with falls of 1 in 14·41 and 1 in 12·36 respectively, and the ends are splayed out in the form of a V about 90 ft. apart. The object of spreading out the outfalls is that a wave striking the rock would be less apt to cause a simultaneous pulsation in the two branches of the outfall than if adjacent to each other and on parallel lines. Both these outfalls were driven in the dry, and with regard to the southern outfall, pilot holes were kept well ahead of the working face, and the connection with the ocean was made last year. The soffits of the outfalls are 20 ft. below high water of spring tides. The invert level of the chamber is 2 ft. 6 in. below high water of spring tides.

Fig 3 shows an access shaft and chamber which is directly connected with the southern outfall culvert, and being 60 ft. back from the sea cliff. The superstructure is formed of 6-ft. diameter cast-iron cylinders, and is 20 ft. above the rock level. At the time this shaft was constructed it was contemplated that a diver would be able to utilise it for the purpose of making an examination of the outfall face after final blasting; but, on account of the very large up-and-down movement of water in the shaft, even on a calm day, the idea was not practicable. Indeed, on one day the movement exceeded 30 ft., whereas in the outfall chamber, 350 ft. back, there was absolutely no tidal movement.

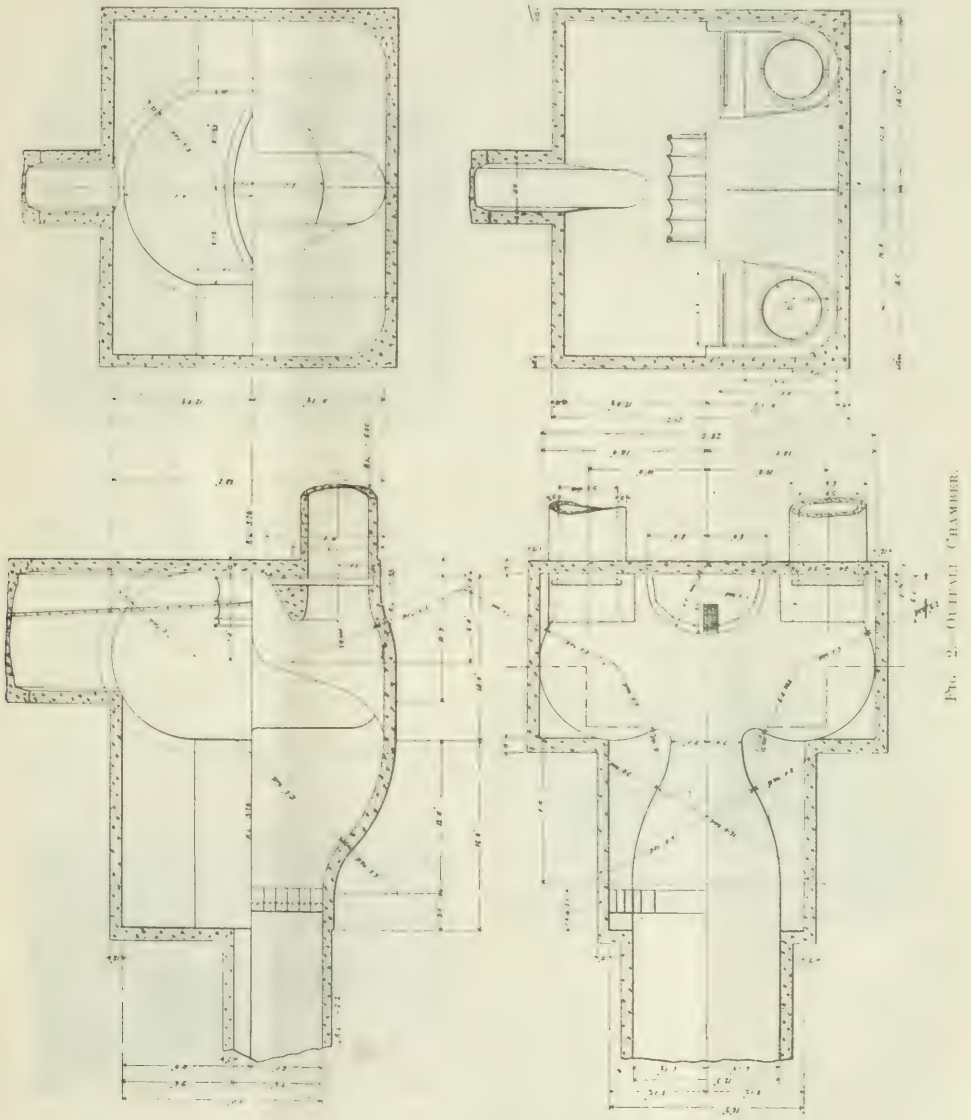

FIG. 2.—OUTFALL CHAMBER.

Fig. 4 shows the gantry for lowering the cylinders, &c., over the face of the cliff.

Fig. 5 shows one cutting from which over 60,000 cub. yds. were removed, and Fig. 6 is a general view of Long Bay.

The work of tunnelling through the sandstone rock—over 2 miles—was done partly by machine and partly

by hand. With regard to the rate of progress in the various drives, experience proved that driving through soft sandstone rock and shale could be done rather quicker by hand than by machine. But in very hard rock, working two shifts, by using machines, the progress was 13 ft. lineal as against 8 ft. lineal by hand in one face. In each face there were two miners for hand work and four miners for machine work. When working two shifts the general average driving per

Fig. 3. Access Shaft.

week in one face having a sectional area of 102 sq. ft. was 10 lin. ft. This was equivalent to 2·5 lin. ft. each miner per week of thirty-six hours with 9·4 cub. yds. Generally there were three truckers working in each face.

Nine shafts, each 12 ft. by 6 ft., were sunk, and varied in depth from 38 ft. to 133 ft. respectively. The cost of sinking through rock was 34s. per cube yard. The longest tunnel drive was 1,586 ft. The cost of excavation in tunnel through the rock, for labour only, averaged 25s. per cubic yard, and the cost for explosives 1s. 7d. per cubic yard removed. The average cost of complete work in tunnel averaged £10 10s. per lineal foot. The machines used were jack-hammers and poppers manufactured by the Ingersoll Rand

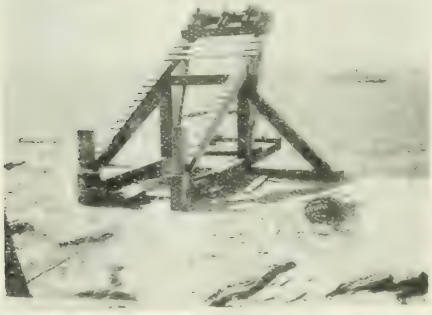

Fig. 4. Gantry for Lowering Cylinders over Face of Cliff.

[illegible] water jet was used with each machine. This consisted of a [illegible] with a special nozzle.

Electrical power was installed the full length, and was used for pumping, hoisting, air compressing, cranes, concrete mixing, and lighting. This power was supplied by the Sydney City Council, and the charge for power was 1½d. per unit.

Several self-contained "Eureka" continuous concrete mixers, driven by benzine engines, were used for mixing concrete, and they were found to be economical and satisfactory.

The length of the second section was 9,420 ft., and the construction was in trench principally through sand, the lower portion of which was very wet, necessitating considerable and continuous pumping operations. The depth ranged from 14 ft. to 60 ft. below the surface. To a height of 30 ft. above the bottom the excavation was taken out with vertical sides; above that level the excavation had sides cut to a batter of two horizontal to one vertical, sloping to a 10-ft. berm on either side of the vertical trench. In the shallow trenches the ground was held with ordinary timber runners, but in the deep trench steel interlocking piles were used. These piles were obtained from the Carnegie Steel Company, and were 12 in. wide, 40 ft. long, and weighed 40 lb. per lineal foot. A travelling gantry, 52 ft. high, equipped with a 2-ton Arnott pneumatic hammer, was constructed for driving the sheet piling, and two water jets were used, one at the back and one in front of each pile. Walings were suspended from the top of the steel piling, and struts placed as required. The sewer in this particular section was heavily reinforced.

The length of the third section was 12,038 ft., and

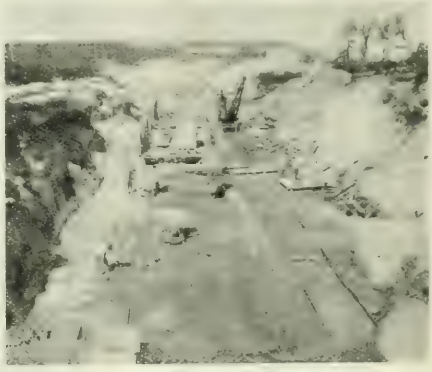

Fig. 5. A Cutting.

included construction both in trench and aqueduct, and also a syphon under Cook's River.

The aqueducts consist of reinforced-concrete arches of 50-ft. span, carrying the sewer; these also have expansion joints at suitable positions. The foundations for abutments, where not on rock, are carried on a piled foundation. At each end of the aqueduct, where the sewer is out of the ground, a foundation in the sand is formed a short distance below the surface with reinforced concrete, and cross-walls carry the sewer.

The syphon under Cook's River—two 4-ft. culverts—is designed with such a fall between its inlet and

Fig. 6. General View of Long Bay

outlet as will give a velocity of over 5 ft. per second when discharging at its full capacity.

The internal dimensions of the sewer on this section are 11 ft. 2 in. by 6 ft. from the end of section to the river, and 11 ft. 4½ in. by 5 ft. 3 in. from the river to the present terminal of the main western sewer. In shallow trench under roadways a heavy concrete section, with covering of I-girders and jack arches, has been adopted.

The whole of the works described are being carried out by the Government on the day-labour system, under the direction of Mr. E. M. de Burgh, M.Inst.C.E.

The engineer responsible for the design was the late Mr. L. A. B. Wade, M.INST.C.E., and the resident engineer in charge of construction for the ocean outfall end up to February last was Mr. H. E. Bellamy, A.M.I.M.E.C.E. That this scheme is urgently required is admitted by all, because Sydney is progressing and expanding at such a rate that there is every likelihood of the metropolitan population reaching 1,000,000 souls in the very near future. Then, again, the tremendous

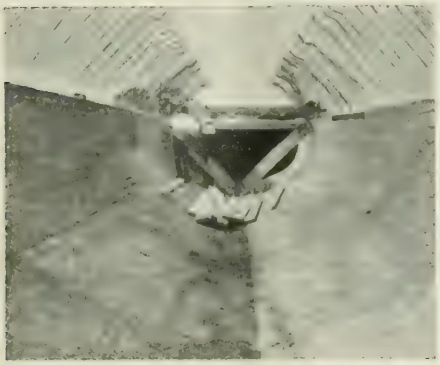

FIG. 7. SECTION OF SEWER, SHOWING ROCK REINFORCEMENT.

growth in all suburbs and the increased value in property is surprising. For instance, for the year ending December 31, 1911, for Sydney and suburban municipalities, the "improved capital value" of properties was £122,101,152; the unimproved capital value was £90,981,644, and the assessed annual value was £7,024,593.

Before concluding, the writer might draw attention to another important sewerage scheme which has also been under construction for the past twelve months, with Mr. H. E. Bellamy as resident engineer-in-charge. This scheme is known as the Vaucluse works, and will have deep ocean outfalls on the lines of the ocean outfall sewer. On this line, however, there will be some deep shafts, the ocean outfall chamber shaft being no less than 264 ft., and sunk through the solid sandstone.

The Maintenance of Flint Roads. With reference to a complaint that dust was swept into the middle of the roads, the county surveyor of Norfolk, Mr. T. H. B. Heslop, pointed out recently that, unless dust and grit were constantly swept over the surface, flint roads broke up. A flint road could not possibly be kept together in a dry season unless it was constantly kept covered with grit or stuff from the sides. This was the most economical way of preventing the roads from breaking up, and without such treatment in a few days a flint road would entirely disintegrate. It was mentioned that at Wymondham gummy silt taken from the pits was used, and this was more effective than dry dust. Mr. Heslop said that he entirely agreed, but that the expense was prohibitive.

Town Planning in Rural Districts. In a paper on this subject presented at the annual meeting of the Rural District Councils Association last week in London, Mr. W. B. Pindar, clerk to the Hunslet Rural District Council, remarked that the obstacles to the preparation of satisfactory town-planning schemes were fewer in rural districts than in urban districts and boroughs. A scheme might be made as regards any land which was in course of development or appeared likely to be used for building purposes; and wherever there was a scarcity of houses, or a demand for the provision of new houses, either by the local authority or by private enterprise, they had a primâ facie case for the preparation of a town-planning scheme. Apart from such a scheme, there was absolutely no power in the hands of the district council to control the lines on which their area might be developed. The cost of preparation of a scheme was not very great, and the preparation was a work which might appropriately be carried on at the present time, when so many other works were held in abeyance. In the discussion, Mr. S. Adams (Auckland) said he considered that town planning was applicable to only a very few rural districts.

CO-OPERATION IN TOWN PLANNING SCHEMES.

The following communication has been addressed to members of the Institution of Municipal and County Engineers by the secretary, Mr. J. W. Dudley Robinson.

"The councils of the Surveyors' Institution and the Institution of Municipal and County Engineers desire jointly to direct the attention of members of the two bodies to the advantages to be obtained through co-operation between surveyors acting for public authorities and those representing private interests, where town planning schemes are under contemplation.

"It is now generally agreed that the welfare of the community demands not only that all classes should live in sanitary, healthy and well-built houses, but also that the environment of their dwellings should be sanitary, healthy and attractive.

"The Housing, Town Planning, &c., Act, 1909, provides the necessary machinery for this object, and the councils have had under consideration the means by which this machinery may best be made to work smoothly. To secure this they are of opinion that the most important matter is to reconcile the various interests affected, and that this would most effectively be done by conferences being held between the officers of the local authorities on the one hand and the advisers of land and property owners on the other, in the earliest stages of the preparation of town planning schemes. At such conferences suggested schemes should be considered on broad lines, and particular attention should be paid to

"(1) Arterial roads for through traffic;

"(2) Estate streets (*a*) communicating streets, (*b*) subsidiary streets for estate traffic only;

"(3) Restrictions to density of building and character of buildings (domestic factories, &c.), and

"(4) Defining building lines on existing and proposed streets.

"These conferences,* which could be quite informal, and might often take the shape of individual interviews, should take place freely in the initial and subsequent stages of the preparation of a scheme, so that, as far as possible, there may be agreement on the main principles before the final Local Government Board inquiry takes place.

"The adoption of such a course would prove advantageous to landowners in that objections against a scheme having been met, or desired amendments obtained, by mutual concession and discussion before the scheme had taken a definite shape, there would be few alterations to be made at the date of the application for approval of the scheme by the Local Government Board. Opposition being thus met before the more advanced steps were taken, the time employed in passing a scheme through the various stages would be reduced to a minimum, and the period during which development could only proceed slowly and cautiously owing to uncertainty as to the shape a scheme would finally take, would be correspondingly reduced.

"The course suggested would also prove advantageous to the officers of local authorities, as their work in preparing and obtaining approval in respect of schemes would be considerably lessened, and the possibility of future friction in carrying out their provisions would be greatly eliminated.

"In order to meet the difficulty, which may be advanced by surveyors representing private interests, that they are unable in all cases to obtain information concerning proposed schemes, and in order to facilitate the work of the officers of local authorities engaged in the preparation of schemes, particularly as to the book of reference, the councils of the two institutions have arranged that, if the officers of local authorities will notify the secretary of the Institution of Municipal and County Engineers when they are about to prepare schemes, he will supply the secretary of the Surveyors' Institution with the necessary information for communication to members of that body likely to be concerned, so that such respective members may get in touch with each other.

"In conclusion, the councils of both institutions desire to impress upon members the undoubted benefits, both present and future, which may be anticipated from a concerted effort to secure that future centres of population shall be laid out with wisdom and prescience, and they venture to express a hope that members of all branches of the profession may do what is in their power, by co-operation and goodwill, to advance this desirable purpose."

* In some cases these are required by the Procedure Regulations.

Institution of Municipal and County Engineers.

MEETING AT MATLOCK.

The final meeting of the Institution of Municipal and County Engineers prior to the annual meeting in London next week took place at Matlock on Saturday last. For the East Midland District the number present was distinctly small, but this was doubtless due, in great measure, to the unavoidable delay attending the issue of the programme, and must not be taken in any way to reflect on the capacity of the hon. district secretary, Mr. Crump, who—as usual—exerted himself strenuously to make the gathering a success. For various reasons the customary paper was not forthcoming, but in its place the members

Mr. Joseph Turner.

Surveyor and Waterworks Engineer to the Matlock Urban District Council.

were privileged to hear a most interesting address by Dr. Bemrose, of Derby, on the geology and mineral waters of Matlock. The sewage disposal works, which are under construction—a joint scheme for the Matlock and Matlock Bath urban districts, the Cromford portion of the Bakewell rural district and the Dethick Lea and Holloway portion of the Belper rural district—were inspected in the course of the afternoon, and an entirely successful meeting was brought to a close by a visit to Messrs. Smedley's famous hydropathic establishment.

When the meeting opened at the town hall there were present: Messrs. N. Alker (Chorley), W. Burn (Sutton-in-Ashfield), C. Clews (Derby), E. H. Crump (Hinckley, hon. district secretary), S. Clare (Sleaford), R. Cordon (Driffield), F. Dean (Eccles), T. Fenn (Belper), J. C. Haller (Nottinghamshire), J. W. Horton (Derbyshire), W. Jaffrey (Matlock), F. Langley (Buxton), W. Mitchell (Buxton), W. Meteyard (Ashbourne), J. S. Pickering (Cheltenham, president), A. J. Ross (Lutterworth), W. Stubbs (Blackburn), S. Turner (Ashby-de-la-Zouch), and A. H. Walker (Loughborough), members; Dr. Bemrose (Derby), Messrs. F. Baxter (Matlock), J. Diggle (Westminster), S. Diggle (Westminster), W. Loades (Derby), J. Lamb (Nottingham), J. Nuttall (Matlock), W. Smith (Matlock), D. Hurd (Matlock), J. Turner (Matlock), D. M. Wildgoose (Matlock), J. W. Wildgoose (Matlock), and J. G. Wildgoose (Matlock), visitors. Apologies for non-attendance were received from Messrs. H. Coales (Market Harborough), F. P. Cook (Mansfield Woodhouse), G. Hawley (Basford), T. Henry (East Retford), F. Hopkinson (Worksop), E. Jeeves (Melton Mowbray), T. Lake (Bourne), E. G. Mawbey (Leicester), S. Maylan (Basford), A. Parker (Oakham), W. Purser (Kesteven), V. Smith (Chesterfield), and H. G. Whyatt (Grimsby).

The Chairman of the District Council (Mr. D. M. Wildgoose, J.P.), in welcoming the members, said that, although only a comparatively small community, Matlock was fully alive to the importance of being up to date in all matters pertaining to its comfort and well-being. His view was that they could not know too much in these days. In particular they realised [illegible] and it was hoped that a result of the sewage scheme [illegible] they had embarked would be that the health of the town—never bad—would be better than ever.

The President (Mr. J. S. Pickering), in acknowledgment, remarked that, while the institution very frequently had under discussion great engineering works occupying the attention of the large cities and towns, they realised the advantage of occasionally visiting smaller towns, as they knew that their undertakings, although not of the same magnitude, were none the less interesting. Indeed, the smaller communities had difficulties which required just as much thought and consideration as the problems which had to be tackled by the larger populations, the only difference being that they had not the same resources at their command. It was not a small matter for townships such as Matlock to secure for itself an adequate and pure water supply, to provide for drainage and sewage disposal, to arrange for the collection and sanitary disposal of refuse, and to meet the modern requirements with regard to the roads. Those and similar important matters seemed to have been successfully dealt with at Matlock; otherwise it would have been impossible for the town to have retained the reputation for which it was famous as one of the leading health and pleasure resorts of the country. Visits such as that were interesting to them all, but particularly to those, like himself, from towns of a residential character, where the main object was to cater for the wants of the holiday-maker, and those seeking quiet surroundings in order to recruit their health. They would be privileged that day to see how Matlock was providing for its visitors, and, by the kindness of the engineer to the scheme, Mr. Diggle, they would also be afforded an opportunity of inspecting the sewage works that were in course of construction. Sewage disposal was a subject in which they they were all interested, and it would give them pleasure to see how the particular problems that confronted Matlock were being dealt with. The facilities the institution afforded its members for improving their knowledge could scarcely be overestimated, for meetings such as that not only benefited the members themselves, but the towns which they represented. Local authorities were coming to recognise the good work the institution was doing, and were, he was pleased to say, giving greater encouragement to officials to attend meetings, and in Matlock he felt they had another town which was in sympathy with their objects. He thanked the chairman of the district council for the very kind remarks he had made, and hoped the visit would be as advantageous to the town as it would be to those who were attending that meeting.

The minutes of the last district meeting—held at Loughborough on April 10th last—having been read and confirmed, the president called upon Dr. Bemrose, of Derby, to give his promised address on

MATLOCK GEOLOGY AND MINERAL WATERS.

Dr. Bemrose said he might say that the position he held as chairman of the Derby Waterworks Committee and vice-chairman of the Derwent Water Board did not qualify him to talk about local water supplies, and therefore he was going to avoid that subject. He was rather fond of inspecting the geological strata of the county, and whenever he saw a scheme carried out, such as the Matlock sewage scheme, which involved excavations, he liked to go down the ladder and see the rocks through which they were passing. He was asked at short notice to give them some information about local geology; but, thinking the matter over, and looking it over with Mr. Clews, he thought if he said something about the Derbyshire basalt used for road metal it would be more practical. Their district secretary, Mr. Crump, suggested that he should say something about the mineral waters of the district. It was quite obvious that he could not go into the whole geology of the district, but he would give them a simple key. That building was situate on the upper beds of the mountain limestone series in Derbyshire; then there were shales, and then limestone, or nodules of limestone. If they looked straight in front of them they would see a hill of mountain limestone. If they went from the station to Darley Dale they would see some very large limestone quarries. If they looked up Matlock bank, about Smedley's Hydro, they would see some

[illegible] and then they came to the millstone grit. The millstone grit was used for building purposes. The limestone was burnt in a lime kiln and made a road very dusty in summer and greasy in winter. There was a road in the neighbourhood which he heard a man describe as pasty; but the paste on that road might very well be turned into some kind of [illegible].

VOLCANIC ROCK.

What was interesting in the mountain limestone of Derbyshire was the volcanic rock in it. They had volcanoes in Derbyshire while the mountain limestone was being formed, and he could take them to a place 6 miles away from there where there were vents into the volcanic tuffs. The rock was formed by the fragments being thrown up from the bottom of the volcano and settling down on the land bottom or the sea bottom. They also found there were two lava streams, which were quite distinct from those in other parts of the district. In one part of the district they were divided by 150 ft. of limestone—there they were divided by 80 ft. of limestone. They would see one in the beginning of the tunnel between Matlock and Matlock Bath. The sewage scheme had been through the igneous rock or lava or toad stone, and they would have to go through it [illegible] as the crow flies to Matlock Bath to Matlock.

UNSUITABLE ROAD METAL.

They got first of all the tuffs, which were fairly friable; nobody would use them for road material. Put a little acid on the stone, and it dissolved very easily. It was light in weight, and had a specific gravity of 2·5 or 2·6. Then they had the lava streams. He had got specimens there of the lower lava of that part of Derbyshire. They would notice some small white specks in it. Those white specks at once condemned it as a road metal. It effervesced when treated with acid, and would not make a good road metal. The specific gravity of that probably came up to 2·7. Those white patches were once some of the holes in the hot lava, and had since been filled up with carbonate of lime. They had the minute fragments which were thrown down and formed the tuffs, and then they had the hot streams of lava which formed over miles of the country. They did not count anything in age of 100 ft. of limestone. They were either formed on land or floated along a shallow stream. But in either case they had suffered from weather, and had been suffering ever since. The water could get down to them, and rock them very rotten indeed before the quarryman came to them. Here was another specimen which looked very good, but it effervesced a good deal when tested by acid. That he should condemn as a road metal. He had two other specimens, very much heavier; one came from the Bonsil sill. After the mountain limestone had been formed, and the millstone grit had been formed, for many years the volcanic action of Derbyshire had not died out.

INTRUSIVE ROCK.

Some of the millstone rock ejected itself in weak places, and then began to spread itself. In two cases in the district it came up to the level of the lower lava. That rock came up when there were some thousands of feet above it and crystallised. It was that kind of rock which geologists classed as intrusive rock, and which should make a good road metal. He was not saying it was the best road metal, but he would say that if they selected the best places from the quarries they should get a good road metal; but if the man supplied some of the lava with it he should send it back to him. They would not select any stone which was light, or which dissolved or effervesced with acid; but if they did they would not use it again, for it came from the lava streams. It was rather dull in appearance, and had no crystals in it. When they came to the intrusives they had crystals in them and grit, and something which would withstand the weather.

Dr. Bemrose then explained some photographs of the various rocks in the neighbourhood, and pointed out those with crystals in them. They might, he said, go into one quarry where they got a good rock, and found specimens of stone which were fresh all through, and they might go into another quarry where the stone was badly weathered, soft, and light in weight. There were only two sets of intrusive stuff in the district. They wanted to know the place of origin, and they wanted to test the stone with acid. If the specific gravity was anything like 3 it was good rock, but if it was anything like 2·5 or 2·7 they should reject it. If the crystals glistened in it very much they would get a good metal.

MINERAL WATERS.

Now as to the mineral water. It had rather an interesting history. There were originally two springs. There was a warm spring, 68 deg. in temperature, found in the seventeenth century. Now there were three springs. The first discovered spring was near the Royal Hotel. The water attracted people, and they built a hotel, and the place which they called the old Bath. People used to come and drink the water and take the bath. The second spring was discovered on the spot which was now called the new Bath Hotel. The hotel had a swimming bath under one of the rooms of the hotel. That bath was covered by a vaulted roof made of stone. The third bath was discovered at the Fountain, but the water was not warm. They suspected that that water somewhere in its course found a cold stream, which mixed with it. They traced its course, found the cold stream, separated the two streams, and got a water at the temperature of 68 deg. Those waters contained a good deal of carbonate of lime, and as they flowed into the air various articles were put into the water, and they were encrusted with that carbonate of lime and petrified. The water had been analysed by Dupre, and was found to contain—

	Grains per gallon.
Chloride of sodium	1·57
Sulphate of magnesium	3·73
Sulphate of calcium ...	2·01
Carbonate of calcium .	11·68
Silicas	0·71
	31·73
Traces of alum	1·03
Total solids	32·76

These were the only three underground streams, though it was believed there were a great number in Derbyshire. It was estimated by a commission, forty or fifty years ago, that between the High Tor at Matlock Bath and the mills at Masson-road—the brick mills—every twenty-four hours 21,000,000 gallons of water came out of the base of the hills and flowed into the river—practically underground water, —supplying the river at one point or the other. These three springs probably produced at the most 1,000,000 gallons per day.

Mr. J. W. HORTON (Derbyshire) said that, while Dr. Bemrose had referred to many tests, he had not referred to the only test which was worthy of consideration—that of the test upon the road. When they applied that test, no matter what they might expect from a quarry, they did not get it. In Derbyshire basalts they would find a very great variation in quality. The result was that, while Dr. Bemrose might advise them to make their selection, they could not do so; they were in the hands of those who exploited these quarries, not in the interests of bad stone, but because they had to take it as it came, and they had to run the risk of getting both bad and good—perhaps he ought to say both good and bad. Unfortunately, in Derbyshire there had been a good many disappointments in the development of basalt quarries. He had worked one basalt quarry and got very good stone indeed; but one met with such varied kinds of material. They would get perhaps one huge boulder that would be good, and then they went a little further and they came to an immense amount of rubbish. He knew one quarry which was worked extensively, and after months of trial had to be closed down because the owners found, after a heavy expenditure on plant, they got more rubbish than good stone. They could not depend on getting good stone, and so there were immense opportunities for losing money. He was still using basalt, and possibly the Derbyshire County Council were using more basalt than anyone else, but he had not found any basalt which would compare in real value with good granite where the price was the same. Of course, if they were buying basalt at half the price they had got a margin; but if he had to pay the same price as for granite, unquestionably he would put his money into

granite. He did not know that Dr. Bemrose would say that the stone he had shown them would equal basalt from Clee Hill. There was some good stone to be got occasionally from Derbyshire, but they could not rely upon uniformity of quality. He was obliged to Dr. Bemrose for his hints as to how to test the quality of stone, but if he would tell them, when a truck of 10 tons of stone arrived, how to pick out the good from the many thousands of pieces, they would owe him a still greater debt of gratitude.

The President (Mr. J. S. Pickering) said that probably Dr. Bemrose was treading upon rather delicate ground there in condemning in a wholesale manner the use of limestone. If it went from the meeting that the stone from the limestone quarries was unsuitable for road metal, their meeting would not be so popular as it was when they began their proceedings. The remarks of Dr. Bemrose required a little qualifying. He had noticed the fearful amount of dust on the roads, and he did not think that ought to be so in the days of motor-car traffic. He thought the reason was limestone was not put to the best use. He had experience with limestone somewhat similar to the limestone of Derbyshire. At one time it was used in roads of water-bound construction. That was abandoned for very good reasons, and Clee Hill basalt, of which they had heard Mr. Orton speak, was substituted. To show the change in road construction, the Clee Hill basalt had almost been abandoned for the use of tarred limestone. But he would like to add that the tarred limestone was only used as a crust. It was laid down 3 in. or 4 in. in thickness, and on the top was laid a coat of tarred granite in order to take the wear. He thought if some system of that kind could be used in Derbyshire districts, in which limestone was used to a large extent, this difficulty of the dust would be entirely obliterated. His own experience was that tarred limestone made an excellent road, far better than a water-bound basalt road, or any other water-bound construction, and, having a tarred granite topping, was almost entirely free from dust. He had a number of roads laid in the method described. These had been down for six years, with a fair amount of traffic, whereas the same roads with water-bound construction only lasted three years. Their life had been more than doubled, they were still in good condition, and they were kept in good condition by tar-spraying, gritting with ¼-in. granite chippings, and steam rolling each year. They did not want to create an impression that limestone was not a suitable material. His own experience was exactly the contrary; if it was used properly it was an excellent material; but used as it was in that district, he thought it was not to be desired. There was a note with regard to the mineral waters. He would like to ask Dr. Bemrose the geological formation from which the mineral waters were derived, and why they got their characteristics as mineral waters. That was a matter he had often considered, and he was sure from Dr. Bemrose's knowledge he would give them some information on these points. As a geologist, could Dr. Bemrose go to other unexplored parts of the country and point out where mineral water springs were likely to be found, or was their appearance due to a freak of Nature? In Cheltenham they had a number of these mineral water springs, but nobody seemed to know where they came from. He moved a vote of thanks to Dr. Bemrose for his address.

Mr. W. Jaffrey (Matlock), who seconded, remarked that limestone in its raw and natural state was not a suitable material for road making, but applied in the form described by Mr. Pickering it would be a suitable material. In Matlock they got limestone at about 2s. per ton, instead of 9s. or 10s. per ton for other stone, and they naturally clung to the local material. His experience of basalt was the same as Mr. Horton's. There was good basalt, but also bad, and time after time they would find among the basalt weathered stone, which was no good.

The vote of thanks was passed.

Dr. Bemrose, in reply, said he was very glad his remarks had provoked discussion. Apparently it might seem that Mr. Horton was in disagreement with him, but the material which they in Derbyshire called basalt was not basalt; geologically speaking, it was dolorite. They had only one basalt in Derbyshire —that was Calton Hill—and it might be mistaken for a German basalt, for it was as good as those on the Rhine. The origin of the mineral waters must be rather deep, for they seemed to keep an even temperature. There were a number of hot springs which were not generally known. Generally, he presumed, the appearance of these springs was due to a fault in the strata which enabled them to come up.

MATLOCK SEWERAGE AND SEWAGE DISPOSAL.

Following luncheon at the Crown Hotel, the President announced that Mr. James Diggle, of the firm of James Diggle & Son, Westminster, the engineers of the above works, had been good enough to offer a few remarks with regard to the undertaking prior to the afternoon inspection, and he was sure the members would be indebted to him for the information.

The scheme, as outlined in a brief descriptive pamphlet circulated among the members, provides for the disposal of the sewage of the urban districts of Matlock and Matlock Bath, the Cromford portion of the Bakewell rural district, and the Dethick Lea and Holloway portion of the Belper rural district. Mr. Diggle said that before he was consulted by the council it had been found impossible to decide as to whether a joint or a separate system was the more desirable, and after he came into the matter five years were spent in inducing the several authorities concerned to throw in their lot with Matlock. The view he took of it was that in a district of that kind, famous as a health resort, it would have been an act of vandalism to have put down sewage works all over the valley, and he thought, when they had inspected the undertaking, they would agree that the sites he had chosen for the tanks and filtration beds could not be improved upon. Unfortunately, owing to the war, the works were still unfinished; had it not been for that they would have been able to see them that day in a completed state, and when they were completed he would be happy to show them to them again. He had aimed at a gravitation scheme, and just succeeded, the flattest gradient being 1 in 782. They had a good deal of low-lying ground alongside the river, but they got over the necessity for pumping by installing Adams' lifts—the cost of which was £5,400. In the course of their operations they had had to undertake a great deal of tunnelling, and had come across plenty of water, in addition to which they had had to provide for five river crossings, the cost of which was £3,360. The cost of the whole scheme was, he was sorry to say, very heavy. The total length of the main outfall sewers was 5 miles, and alongside the river they were obliged to use iron pipes because they were below the river. There were river walls which had to be constructed owing to the steepness of the valley, and the bridges added to the cost of the river crossings. Owing to the inability of the first contractor to complete the scheme after some £8,000 worth of work had been put in, they were obliged to call for fresh tenders, and were now—as a result of the initial experiences—paying 50 per cent more as compared with the original tender—which was for £38,722. He could not tell them exactly what the cost would be, but he thought they might take it that, after receiving the contributions of the various authorities, the amount would be substantially £60,000, including land, easements, contingencies and engineers' fees.

The President said he would like to take the opportunity of thanking Mr. Diggle for his interesting remarks, which he was sure would prove of value to them when they made their inspection of the undertaking.

SEWAGE WORKS.

The works, which will provide for a population of 13,000, and a dry-weather flow of 360,000 gallons per day, will occupy 16½ acres of land, divided as follows: Site of works, 5½ acres; filtration plots, 10 acres. There will be two screening chambers, each 11ft. 6 in. long, 4 ft. 6 in. wide, and 2 ft. 6 in. deep. The detritus tanks will be four in number, each 18 ft. long, 11 ft. wide, and 3 ft. deep; total contents 14,850 gallons. All sewage up to six times the dry-weather flow will pass through the detritus tanks. There will be four sedimentation tanks, each 80 ft. 9 in. long, 30 ft. 9 in. wide, and about 6 ft. deep; total contents, 360,000 gallons. The percolating filters will be eight in number, and of the circular type, each 70-ft. diameter, with brick walls, 2 ft. 9 in. high, and clinker walls above. The filtering medium will consist of destructor clinker, broken to pass through a screen of 1½-in. mesh and retained on a ⅜-in. mesh, except the bottom portion which will be broken to pass through a screen of 4-in. mesh. The depth of medium will be 5 ft. 5 in., and the cubical contents 5,500 yds. The "Simplex" distributors have been adopted.

The humus tanks will be two in number, each

[illegible] 6 in. long, 21 ft. wide, and from 2½ ft. to 5 ft. deep, total contents 82,000 gallons. There will be [illegible] filtration plots. The land is of a porous character. The supply pipe will be 21-in. diameter, and crosses the river Derwent by means of a syphon.

The engine-house, 30 ft. long by 22 ft. wide, will contain two 10-horse power oil engines for the lifting of sludge—the lift from the well to the bed will be 24½ ft. The sludge well will be constructed under the engine-house, and will consist of cast-iron tubbing, 10-ft. diameter and 17 ft. deep. The sludge beds will be four in number, each 40 ft. 9 in. long, 14 ft. wide, and 2 ft. deep. An area of [illegible] has been provided for storm water area.

SEWERAGE.

The main outfall sewer will be of 24-in. diameter earthenware and cast-iron pipes; other sewers will be from 6 in. to 21 in. in diameter. The total length of sewers will be 12 miles.

Storm overflows will be two in number, and there will be four automatic flushing tanks of from 1,500 to 2,500 gallons capacity.

The river Derwent crossings spoken of by Mr. Diggle will consist of three lattice-girder bridges, 80-ft. span, with footways 4 ft. 3 in. to 6 ft. 6 in. wide; one bow-string girder bridge, 9-ft. span, and one river crossing (below river bed).

The two Adams' lifts will be situated at Matlock Green and Hall Laithes respectively, and have capacities of 11,250 and 8,000 gallons, the nett height of lift in feet being 11¾ and 17¼.

As stated, on returning from the sewage works—where additional details of the undertaking were given by Mr. Stanley Diggle—the members proceeded to Smedley's hydropathic establishment, where, following the inspection, they were entertained to tea by the directors. On the proposition of the president, votes of thanks were accorded to the urban district council for their reception of the institution, to the directors of Messrs. Smedley for their hospitality, to Messrs. Diggle & Son for their information regarding the sewage scheme, and to Messrs. Jaffrey and Turner for their share in the arrangement of the meeting.

The proceedings then terminated.

SCOTTISH DISTRICT MEETING AT AYR.—(*Conclusion*)

The paper discussed at the recent Scottish District meeting of the Institution of Municipal and County Engineers at Ayr was the following:—

SUGGESTED TOWN PLANNING DETAILS FOR SCOTTISH CONDITIONS.

E. Jones Bryce, M.Inst.C.E.
Office of Public Works, Glasgow.

[Mr. Bryce served his articles from 1877-1882 with Messrs. A. & W. Black, who were acting at that time as consulting engineers to the burghs of Falkirk and Grangemouth. From 1882 until 1890 he was an assistant with Messrs. Kyle, Dennison & Frew, Glasgow, and before severing his connection with the firm was promoted to the position of principal assistant over a large staff, and was responsible for the carrying through of many important street, drainage, and water works. In 1896 he was appointed by the city engineer of Glasgow as special assistant in connection with the carrying out of the Glasgow main drainage scheme, and three years later became burgh engineer and master of works at Partick. His transfer to the Glasgow Office of Public Works took place in 1912.]

The Scottish Local Government Board have issued procedure regulations for regulating generally the procedure with respect to the preparation or adoption and the approval of town planning schemes, but as yet they have not issued any set of general provisions dealing with the matters particularly referred to in the fourth schedule of the Act. It may be that the board have no intention of doing this, and that they will decide on the merits of each scheme as it is submitted. Local authorities will therefore have to formulate provisions themselves, and especially on such matters as widths of roads, height and character of buildings, provision of open spaces, and the limitation of the number of houses per acre.

It is hardly necessary to point out that, owing to the difference between the English and Scottish methods of building development, it is essential that some general principles should be arrived at in view of the preparation and impending approval of the first town planning schemes in Scotland.

The provision of the existing statutes applicable to Scottish cities and burghs will have an important bearing in arriving at reasonably sound principles for town planning development.

It is recognised that town planning is an attempt to get away from cast-iron regulations and statutes; but, however desirable this may be, the fact remains that too drastic and extravagant propositions which are away from the spirit of the ruling statutes will lead to schemes more or less abortive, and will expose local authorities to many difficulties, financial and legal. . . .

Among the chief features requiring to be fixed in any town planning scheme are:—

(1) The minimum width of subsidiary roads.
(2) The minimum percentages for open spaces in dwelling-house areas.
(3) The maximum height and character of dwelling-house buildings.
(4) The maximum number of dwelling-houses per acre for various classes of buildings.

Each of these features will be considered in the following notes, which are submitted for the purpose of criticism, and, if possible, arriving at some general principles for both urban and rural areas. . . .

THE MINIMUM WIDTH OF SUBSIDIARY ROADS.

On the question of the minimum width of subsidiary roads, it will be observed that in the Dunfermline scheme roads are proposed as narrow as 20 ft., including footways where the carriageway is 13 ft. wide, and the length does not exceed 350 ft. Such streets are to be provided with one turning space near the centre.

It appears to me that for modern conditions it would be better to have the carriageway of a road, even in the quietest of areas, wide enough to allow two vehicles to pass each other. This would require a minimum width of 18 ft. for carriageway, and, with footpaths of a minimum width of 5 ft., would fix the total minimum width of the street at 28 ft.

Such a width would be a great difference from statutory widths, and the difference in cost in a complete system of subsidiary roads would form a suitable basis for negotiations in regard to the provision of open spaces and wide building lines.

The foregoing proposals are only suggested for rural areas, where there is to be an open type of development like the Dunfermline scheme. In the case of an area to be developed in a more urban district, say, where tenements of from two to four stories are proposed to be erected, the increased population and traffic would require that the minimum width of such subsidiary roads should be increased in the carriageway to 24 ft., and in the footpaths to 8 ft., giving a total width of 40 ft. between the parapets.

Building Lines.—It is a generally accepted principle in schemes of open development that the building lines of subsidiary roads should not be less than 70 ft.

apart. In the case of roads where tenements of dwelling-houses are proposed to be erected an endeavour should always be made to fix minimum building lines at 80 ft. apart in the case of two-story tenements, 90 ft. apart in the case of three-story tenements, and 100 ft. apart in the case of four-story tenements, especially where these are running east and west. . . .

The ground floors of three-story tenements on the north side of streets with building lines 60 ft. apart are without sunlight for four months in the year, and in the case of four-story tenements under like conditions the absence of sunlight from the street-floor houses covers a period of about five months. To widen out the building lines as suggested has an appreciable effect in the possible increase of sunlight. The ground-floor houses of three-story tenements on the north side of a street with building lines 90 ft. apart would be without sunlight at noonday for about two months as against four months for building lines 60 ft. apart. And in the case of similar houses in four-story tenements 100 ft. apart the absence of sunlight would be reduced from five months to three months. In the case of streets running north and south there is not the same necessity for widening out, owing to the fact of the sunlight having access to both sides of the street for some hours each day at any time of the year.

The beneficial effect of sunlight upon the health of the human being is a matter of general knowledge, and modern medical authorities insist so strongly upon the necessity of sufficient solar light reaching the dwelling-houses of the people that every available opportunity should be seized by town planning engineers to provide for this.

With reference to tree-planting in streets where tenement blocks are to be erected, it is questionable whether this should be done. In any case it is never advisable unless the building lines are fixed at the increased widths suggested.

THE MINIMUM PERCENTAGE FOR OPEN SPACES IN DWELLING-HOUSE AREAS.

An open space, which should provide facilities for a certain amount of recreation, should be not less than from 1 to 2 acres in extent (say, an average of 2 acres), measuring to the centre of the surrounding streets, and it would seem to be much more practical to provide these on some definite principle than to have small areas of little real value at close intervals.

In the case of areas restricted to less than, say, fifteen houses per acre, open spaces are not required so frequently, as each house has its own garden. In the case of various closer types of urban development, separate open spaces should be provided and arranged on some recognised principle. Population, and not area, should be the guiding factor in endeavouring to fix the areas required for such spaces. . .

It is not suggested that these small local open spaces should supersede the necessity for arranging larger areas or "playing fields" for adults at one or two places in a large scheme. The 2-acre spaces would secure an open and ornamental character of development for urban conditions, and at the same time provide suitable recreation places for young children, and should be arranged, if possible, on the principle that they will increase considerably the value of the houses fronting or adjacent to the open spaces.

THE MAXIMUM HEIGHT AND CHARACTER OF DWELLING-HOUSE BUILDINGS.

It is clear that, on this question of height, there is a unanimous opinion that, wherever possible, four-story tenements should be abolished, and that the extreme height of this class of building should not exceed three stories. . . .

With reference to the "character" of buildings, the opportunity given in town planning schemes to abolish "corner" tenements should be taken advantage of, as also the erection of single-apartment houses. It should also be provided, as far as possible, that every dwelling-house in a tenement should have through ventilation—from front to back.

THE MAXIMUM NUMBER OF DWELLING-HOUSES PER ACRE FOR VARIOUS CLASSES OF BUILDINGS.

There are abundant precedents to guide the engineer in determining and regulating the distribution of buildings where the open style of development is to be adopted all through. The difficulty arises in schemes adjacent to large towns and cities, and bordering on closely built-up areas. Such schemes will require to provide for the limiting of the number of houses per acre on a grading principle from a reasonable allowance for four-story tenements down to the cottage type. . . .

On a matter of this kind, where the maximum has to be fixed, it may be accepted that, as two-apartment houses should be discouraged as far as possible, and every facility be given for the erection of three and four apartment houses, an average between two and four apartment houses—viz., a three-apartment house—might safely be adopted as the standard for limiting the number of houses per acre, and these would be as follows: For two-story tenements, twenty-six houses per acre; for three-story tenements, thirty-three houses per acre; for four-story tenements, thirty-seven houses per acre.

[In an appendix to Mr. Bryce's paper is given a summary of the chief points in the proposed town planning scheme for the burgh of Dunfermline, this being followed by various criticisms by members of the Town Planning Committee of the Scottish District.]

DISCUSSION OF MR. BRYCE'S PAPER.

Mr. J. Young (Ayr) said, as a humble student on this subject, he had been very much impressed with the many side lines there were to be considered. It was not a subject which could be looked into in a superficial manner at all; it was one they must sit down to and think out in detail. The paper all through was built up on a comparison of the open and closed type of development in town planning. He thought Mr. Bryce was very wise in doing that, because for the first time, he thought, under the Town Planning Act was revealed the actual difficulties that there were in close development under town planning schemes. Under the open development schemes, or in rural districts, they had not the same difficulties, and they could there develop more on the English principle where the buildings were low and a small number to the acre. It was a very much more difficult matter to town plan for three or four story tenements than it was to design for cottages, varying from an average of eight houses to the acre up to a scheme in which perhaps there might be twenty to twenty-four houses to the acre. The difficulties that emerged seemed to be three—the appropriate size of the land unit; the proportion of density on that land unit; and the proper percentage of open spaces to be set apart in that land unit. It seemed to him, taking first the land unit, that, apart from the arbitrary limit, there might in schemes be natural limits to the boundary. It depended on the character of the district. They might have a small area which in its configuration was undulating in character, which might be limited, say, to the top of a rise in the ground where it might be necessary to have roads round about at the lower level. They might take that, and make that land the unit, and develop it under those three heads of density, proportion and open space percentage. That could only be done in fixing the size of those land units on paper on the plan that was being developed. Mention had been made of an arbitrary land unit of 5 acres, split up into squares. He thought that was absolutely useless. He was entirely at one with Mr. Bryce in thinking that the Ruislip-Northwood scheme was of no value at all in determining the density proportion of houses built for that land unit. The paper was particularly valuable in pointing out to them, he thought for the first time, the importance of sunlight for public streets and dwellings in those streets. He agreed that it was very advisable to develop streets running north and south as much as possible; but he thought in the provision of schemes there ought to be some clause which would not allow the taking away of the benefits of the sunlight, even in streets running north and south, and that all extreme projections in the way of outbuildings should be prohibited on account of the blanketing of the sunlight on rooms on the ground floor. They could well see, if a villa 35ft. or 40 ft. deep, had also a wing, anything from 20 ft. to 25 ft. deep, that that wing, if two stories high, would effectually exclude the sunlight in the west room when the sun was shining from the south, even if the streets were running north and south. Therefore he thought it very advisable in the provisions under the scheme that projections from the rear of buildings should be very strictly looked after. Another point in reference to sunlight which he did not see recognised in the paper was the proximity of separate dwelling houses to each other. They had a street running north and south under ideal conditions, but they had houses built within 4 ft. of the boundary, and the next house built within 4 ft. of the boundary, only leaving a space of 8 ft. or so

between the houses. Any windows on the sides of those houses would, of course, be blanketed for sunlight, so he thought it advisable that there should be [illegible] as to the width of houses on the sites, as well as keeping back the main frontage lines.

Mr. J. THOMSON (Dundee) said it occurred to him that there was no necessity at all for the so-called land unit, and the 5-acre unit, suggested in the South, would never suit Scottish conditions. In Dundee it happened that they were negotiating with very friendly landowners, few in number, and as far as division into particular units was concerned, he thought they would be able to arrange with them that new physical and existing boundaries would be most appropriate for laying out these points in a way that was in accordance with the Town Planning Act. On the point as to the blanketing of sunlight, if there was any accommodation, such as wash-houses or closets, it should be at the side. In the South it was placed in the backyard, but that would never satisfy Scottish requirements. In regard to the attempt to standardise matters of construction, they might discuss such matters until doomsday, but they could depend on it that every district would have its own views. They could, however, agree as to the width of streets. They must in any case have room for two vehicles to pass and a reasonable width of footways, and he thought 30 ft. was more like the figure than 20 ft. Another point with regard to these roads was that in many cases they provided for planting trees. He passed down a beautifully wooded street on his way to that hall, the trees growing in the gardens of the houses; but there were no trees planted in the street itself. If there had been trees planted in that street it would have been spoilt. So every borough engineer would have to arrange for tree planting as they had done in Ayr, where they had not planted trees if there were gardens in front of the houses. The street to which he had referred was an old street, and the trees were well grown.

Mr. P. C. SMITH (Dunfermline) said he hoped in anything he had to say as to the Dunfermline town planning scheme they would not take it he was an authority on the matter. It was only a few months ago since he became connected with Dunfermline and its town planning scheme. It might be useful to give some particulars and remove some misunderstandings. As regarded the width of arterial roads, they all knew that in provincial towns, if they had to buy up land and pay compensation for the making of wide arterial roads, then town planning schemes would be unworkable for towns of 30,000 or 40,000 people. In Dunfermline they approached the owners at the beginning on this question of land as a matter of give and take. The landowners were men of sufficient business capacity to see the wisdom of giving land for wider arterial roads. In all cases the land had been given free to the corporation, and in most cases the landowners had undertaken the expense of forming 40 ft. of the 100 ft. roadway. Thus the owners were paying two-fifths of the cost and the town the other three-fifths of the cost of making these 100-ft. roads. He thought that was a very good bargain for the town. Coming to the secondary roads, the landowners had seen that it would be to their advantage to give wide roads in opening up cross-communication on the estate. They arranged to get roads of from 60 ft. to 80 ft. In every case the land had been given free, and the landowner made 40 ft. of the roadway. Mr. Bryce had referred to a 20-ft. roadway in Dunfermline. He might explain that there was only one road of that width, and it was a road which, according to the contour, could never be built upon other than on one side. Then Mr. Bryce had spoken of a 7-ft. road which had to be widened up to 12 ft. That 12 ft. of roadway was sufficient to allow the baker's cart, the butcher's cart, and the coal cart to the front of those houses. He did not know whether it was Mr. Bryce who spoke of introducing a narrow lane at the back of the houses. He was against that. It was going to add to the cost of development, and bring a charge upon the landowner and the feuer, which would make cheap houses impossible. Having what they called in Scotland a close between every two houses, to adopt a further entrance to the backs of these properties would largely add to their cost. The other point was the minimum space of land area and the land unit. Mr. Young, in his criticism, said that the land unit and the open spaces and density hung very much upon one another. He thought they would find in their town planning schemes the dense units would be those in near proximity to public works, and there they required larger open spaces. As Mr. Thomson had said, it was for each individual area to consider and determine the merits of its own scheme rather than to fix any hard-and-fast rule. Coming to the height of buildings, this was another point which had given rise to some misconception. In the height of domestic buildings were included those tenement buildings 60 ft. high, with two stories built in the roof. But in the ordinary dwelling-house there was to be only one story built in the roof, and that was to form part of the house below, and not be a separate house by itself. Therefore he thought the story in the roof would never be built. A man who could afford to build a house with a story in the roof could afford to build a cottage; so he thought there would be no demand for these houses with a story in the roof. As to tenement buildings, that, he thought, was a matter which every town planner must consider in relation to his own district. The circumstances in Dunfermline were entirely different from what Mr. Thomson found in Dundee, or Mr. Bryce in Glasgow, or Mr. Young in Ayr. The four-story tenement, which they would all like to get rid of, they might have to allow. He thought their aim should be to make the three-story tenement the maximum height, and go on from that to the two-story tenement, and then on the cottage development. There seemed to be a dead set against the one-story house, and the story in the roof for private occupation, as compared with the complete house. That, again, was ruled by the economic conditions prevailing in the industrial centres. Take areas like Dundee, where they had a considerable number of single women living by themselves; those women said they could not afford to have a two-roomed house. In Arbroath they had a number of one-room dwellings. They could not lay down any hard-and-fast rule; every one of them must consider the matter in relation to their own individual circumstances.

Mr. W. ROSS YOUNG (Lanark County) said he was glad that this important subject of town planning was again being discussed at their conference. Indeed, it was a subject which had been discussed at most of the recent conferences dealing with municipalities. The need for having legislation for governing the growth of the populous areas had been much felt by all of them, and he thought when the Government passed the Housing and Town Planning Act of 1909 it did one of the greatest things to benefit social reform that the country had done for many, many years. They would all agree that the Acts they had had in the past—the Housing and Sanitary Acts—were merely palliatives to keep down disease and reduce the social evils arising from existing housing conditions. This Act, however, came to the root of the whole thing, and said, "Let us plan out our own towns before proceeding to erect them." Surely, if it was necessary for an architect to plan out a house before he erected it, it was more necessary to plan out the whole fabric of a city before it was erected. The Town Planning Act was a good measure. They had heard it criticised; he had heard it called weak and hardly applicable to Scotland. The Town Planning Act was a fair working Act, and with a thorough understanding of the provisions there should be no trouble in evolving schemes for the growth of their areas, which should produce towns and villages more magnificent than they had ever had before. They were all aware that this Town Planning Act could be applied to any land in course of development or likely to be used for the purposes of development. It further stated that they might include land which had already been built upon if that land was situate in regard to the land not built upon that it was advisable to take it in. That gave them great powers over towns where building was likely to take place. It also gave them power to obtain land for new roads. It said that they could take any ground required to make trunk roads. The Act really gave the local authorities power to include all the land that was necessary. Mr. Bryce's paper dealt more or less with what those provisions ought to be, and the conditions in framing those provisions. The conditions which had been introduced into town planning schemes were (1) those provisions which governed the width, direction and construction of the streets; (2) those provisions which governed the various zones or areas to be set aside for purposes of public works, houses, &c.; (3) those provisions which would limit the number of houses to be erected per acre; (4) those provisions which would limit the building line in streets; (5) those provisions which would govern the open spaces in future to serve the town; and, lastly, the provision

which would ensure the sanitary condition of the area to be maintained. Mr. Bryce had largely dealt with three of the factors—first, the width of streets; second, the number of houses to be erected per acre; and, third, he had dealt, to some extent, with building lines and space about buildings. The width of the streets must be graded according to the traffic they were to carry, and the number and class of buildings to be erected. In the past they had had to grade their pipes and sewers according to the work they had got to do, and why should they not grade the streets according to the work they had to do? Therefore, in future there should be no trouble in grading streets. As regarded the minimum width of streets, he was not going to find fault with Mr. Bryce. Make the width of the main streets as high as they could; but remember this, if they asked the landowner to give land for main streets of 100 ft. wide they must give him an advantage on the interior roads where cottages were built. Now as to the number of buildings per acre. They were all in favour of six or seven as the number which they would like to erect to the acre. He believed that was a matter which they must deal with on its own merits, and consider in relation to the circumstances. They were all agreed that the number of buildings to be erected in future must be considerably reduced; there must be an end put to this overcrowding. They must try to reduce the number from what it was now to about one-half. It was not an uncommon thing to have plans presented where a man attempted to erect 100 houses to the acre. That was ridiculous. As to the height of buildings, he agreed with Mr. Bryce that they should have the height reduced. Let the four-story tenement be reduced as soon as possible. Make any provision for three-story tenements as limited as possible. Get the buildings reduced to two stories as far as possible, and get a regulation as to get cottages instead of tenements. There was a difficulty in absolutely doing away with tenements. They must house the men fairly near their work, and that was against doing away with tenements altogether; but they should make provisions which would discourage tenements as far as possible. As regards sanitary provision, they in county areas would be greatly indebted to towns in that respect. They hoped in their schemes they had introduced provisions whereby they would secure for every house a water-closet, and a larder where they could keep meat and milk. With regard to the size of the house, he could not agree with Mr. Smith. He thought the day for the one-room house was going past. He agreed that there were some cases in which the one-room house was required; but the one-room house for the widow they often found occupied by a family of seven or eight. He thought the one-room house should be done away with.

Mr. J. Lee (Paisley) said this was the best contribution he had ever read on town planning. He agreed that it was no use having 20-ft. streets; no street should be of less width than 36 ft. There were a lot of ideas about having trees and grass verges, and only about 9 ft. of made roads in the centre. They all knew where it led to, and the condition into which the grass fell. It was far better to have the carriageway of the street properly formed, and properly maintain it. As regarded the single-room house, in the large towns the single-room houses were absolutely necessary. In his district single-room houses were always in demand for the old people and for girls. He was pleased that Mr. Bryce had condemned the four-story tenement. It would take some time to get rid of it, but the sooner builders realised that it was undesirable the sooner they would have it abolished.

The President said he would like to express the thanks of the members for the very valuable paper he had contributed. He quite agreed with Mr. Lee that this was one of the most important papers that had been submitted on the important subject of town planning. He thought the method which had been adopted of sending out this paper in advance to the Town Planning Committee was one to be very highly commended, as they had not only the opinion of the author, but the experience of others particularly interested in this subject, and who had had the time to go through the paper, and give them their views. He was sure they would agree in expressing their thanks to Mr. Bryce for his very able paper on this subject.

The vote of thanks having been passed,

Mr. Bryce thanked them very much for the way in which they had received the paper. The paper was only in the way of suggestions; he had not adopted the dogmatic tone in saying that it must be this or that, but had made it only by way of suggestion. He thought the day would come before long when local authorities, by conference with their officials, would arrive at some kind of definite proposals—a kind of model by-law idea for town planning. He hoped that day was not far distant, and it was in view of the possibility of that that this paper was written, because, as far as he could see, in all the literature on town planning there was nothing specially applicable to Scotland and Scottish conditions. Therefore it occurred to him at the Dunfermline meeting last year, and it was also impressed upon him at every conference, where the Scottish conditions were notorious by their absence, that it was high time something was done to lay down some kind of suggested principles for Scottish town planning, and if this effort had been of any value, he was very pleased that the meeting had suggested it. He had nothing to say in regard to any criticism because the criticisms, as far as he could see, were all sympathetic, and there was nothing to object to in any way.

PRESSURE-SCRAPING OF WATER MAINS.

The scraping of 15 miles of water mains was described in a paper by Mr. James Macfadzean, B.Sc., Assoc.M.Inst.C.E., the assistant burgh engineer of Ayr. The contribution is reproduced on p. 772 of this issue.

Dean of Guild Kirk (Coatbridge) said the data placed on record in the paper would be much appreciated. The Coatbridge and District Water Trust had been obliged to scrape a main for a length of 33 miles, and were compelled to put in hatch-boxes much in the same way as had been done at Ayr. The number of and distance between these was all regulated by

Mr. James Macfadzean, B.Sc., Assoc.M.Inst.C.E.
Assistant Burgh Engineer, Ayr.

Mr. Macfadzean was educated at Greenock Academy and Glasgow University. He was for two years in the works of Messrs. Glenfield & Kennedy, Ltd., Kilmarnock, and then served articles with Messrs. Nasmyth, Baird, civil engineers, Glasgow. After being about six years with this firm, he went to Canada, and was for two years in Western Canada in charge of the construction of various municipal works for Messrs. Galt & Smith, of Toronto. He came home, and, after being for nearly a year in the engineer's office of the Clyde Navigation Trust, he was appointed chief assistant to the burgh engineer and surveyor of Ayr about five and a-half years ago. Mr. Macfadzean graduated B.Sc. Engineering in 1906, and was elected an associate member of the Institution of Civil Engineers [illegible]

the contour of the line. He considered it was always desirable that the hatch-boxes should be enclosed in a brick chamber, for that helped to avoid trouble with the farmers, and greatly facilitated operations. Another point was that, in bringing a main up to ordinary conditions instead of including the cost of the hatch-boxes in the main scraping it should be put down to capital expenditure. They had experienced the difficulty of their scraper getting stuck; they had lost it and recovered it 1½ miles ahead. Their percentage of carrying capacity was not so much reduced as in the case of the pipes which had been referred to. The maximum flow of the main was expected to be 2,000,000 gallons, and a little more than twelve months afterwards they were carrying only 500,000 gallons less than the real maximum of the main. At Ayr they began the scraping at the smallest part of the main, but in his own case they put the scraper in at the measuring-house, and did the 18-in. main first. That gave them a greater hydraulic pres-

ance. They employed a Glenfield and Kennedy's scraper, and obtained most excellent results.

Mr. M. SELLARS (Dundalk) said that, as one with some experience of this work, he thought the subject of the paper was most interesting, and there was no other in which the municipal engineer learned more by trial and error. It was marvellous the number of things that could be brought out of a water main. He was not sure that the expense of the hatch-boxes could not be done away with; he thought too much money had been spent on these. At the present time he was scraping an 8-in. main for the first time after thirty-one years. He believed in a travelling valve, but as regarded putting a plug in the hatch-box his experience had been a sad one, the scraper driven it up into the hatch-box. He wanted to know why the smaller pipe referred to by the author was scraped first. By far the most important thing in the paper was the suggestion for the prevention of incrustation, and when Mr. Macfadzean mentioned double dipping he did a great service. It was one of the best points in the paper. In a paper he read some three or four years ago he stated that American writers were of opinion that it was economical to scrape mains so that the delivery was reduced to the level of the demand. The question was to know when to begin.

Mr. P. C. SMITH (Dunfermline) gave some information in regard to a 12-in. main which had been scraped regularly for the past twelve years. The main was divided into seven sections, with the hatch-boxes as nearly as possible equal distances apart, and enclosed in a brick chamber, so as to have a satisfactory drain into the stream. Consequently there was no question about surface damage to farmers and others in the operations. The scraping of the mains took two or three days. In April it took two days, the work being done on two days of the Spring holiday, so as to cause the least inconvenience to other works. They took up a portion of the main, and began operations by opening up the hatch-boxes as they went along. In order to get over the difficulty of the plug being driven into the main, his predecessor adopted a scoop which he placed in the pipe over the plug. It was quite a simple thing, and made a very convenient arrangement for getting the scraper out of the pipe. Another device that had been introduced by his predecessor in order to overcome the difficulty of the scraper sticking in the pipe was a fish cutter, and since that had been done the trouble had disappeared. He had also added a wire brush which seemed to increase the efficiency. The main was usually scraped in the month of October, but his predecessor advised him to get away from the winter scraping, and do the work in the month of April. He had found that with his October scraping he had increased the efficiency by 30 per cent. With the April scraping he put on another 17½ per cent, and he found, on examining the figures for the previous years, that that practically brought the main back to its original efficiency. The cost of scraping over the two days amounted to £27—or less than £2 a mile.

Mr. J. CULLEN (Stirling County) stated that in his case, where they had to scrape every three months, they had found great benefit from putting in brick chambers and reinforced-concrete covers, and drains from all their hatch-boxes.

Mr. J. LEE (Paisley) expressed the view that, instead of scraping a pipe every few months, it was better to take out the pipe altogether—especially after thirty years' service. Of course, there was not so much trouble experienced with delivery pipes as with the distributing pipes; but he should like to know if anyone present had had experience of the scraping of pipes of from 4 in. to 6 in. in diameter. He thought for small pipes the Power-Cleer system was very good. Mr. Smith had spoken of his main being scraped every year, and he would like to know whether that had any effect on the pipe. In his view it must. Mr. Cullen's case was worse; to scrape a pipe every three months would soon destroy it.

Mr. D. A. DONALD (Grangemouth) stated that he also had obtained very satisfactory results with the Power-Cleer machine. As to the question when it was not desirable to scrape a pipe, he thought Mr. Goudie could say something.

Mr. A. H. GOUDIE (Stirling) said they had a main which had been scraped before he went to the town; that was twenty years ago. Attempts were made to rescrape it, but the pipe was in such a condition that they had to give it up altogether; in spite of which, however, it was still in use, and doing efficient service. It was an 8-in. main. It was not giving the delivery it ought to, but during the seventeen years he had been in Stirling it had never varied in the amount of water it gave.

Mr. J. WADDELL (Burntisland) mentioned the case of a pipe which, when first scraped, had lost 22 per cent of its capacity. Its full carrying capacity was restored by the scraping. During the time it had been under his charge it had been scraped annually, and in every case the result had been the same. Every year the carrying capacity fell off 22 per cent, and the full carrying capacity was as regularly restored by the scraping.

The PRESIDENT (Mr. J. S. Pickering), in closing the discussion, remarked that, fortunately, water engineers generally did not have to deal with pipes requiring this scraping; but those who had would have obtained some very useful information from the paper and the discussion. Would the author, in replying, tell them how he managed to keep the town supply going on while the work was proceeding?

Mr. MACFADZEAN said he wished to thank those present most cordially for the way in which they had received his paper. He agreed entirely with Mr. Kirk that the cost of the water-boxes should be included in the capital cost, and that was the reason why the cost, leaving out hatch-boxes, &c., was worked out separately in the paper. Mention had been made of the number of articles found in pipes, but he thought their mains were well laid, and constructed under proper supervision, because they had discovered nothing of the kind in them, nor any badly-run joints. The question had been asked why the smaller pipe was scraped first. It was really a difficult point to decide which to do first, for if they scraped the smaller one first they lowered the pressure head where the main changed size. That could be remedied in a way by sending back the pressure by closing certain valves. On the other hand, if they had scraped the other main first, the pressure head would have risen where the main changed size, and as their relief mains were not in good order, they did not take the risk. With regard to the method of scraping by a travelling valve, it occurred to him that that was introducing needless expense, for then the main had to be cut every time scraping was undertaken. Mr. Lee had spoken of the scraping of smaller mains. They had, of course, gone in for that by means of the Power-Cleer machine. He had seen it stated that it was not advisable to scrape by means of pressure any mains of less diameter than 5 in. He did not think he would scrape one under 6 in. under water pressure unless there were an exceptionlly good head, and the decision to scrape a main of either 5 in. or 6 in. would depend on the incrustation. Each must decide for himself whether it was wise to scrape a main or not. Personally, he did not think it was wise to do it unless one was really "up against it," because the corrosion always became more rapid after the first scraping. They would now have to scrape every two or three years, and as the main had gone on for thirty years or so without scraping, possibly it might have been advisable to let it go on. But in that case they were "up against it," inasmuch as they had to supply water to the town, and the only alternative was a large capital expenditure.

VISITS.

At the close of the business proceedings in the county hall the members divided into two parties, one making visits of inspection to the refuse destructor, the electricity station, the hospital extension and the pavilion and esplanade, and the other going to Alloway to see Burns' monument and cottage—as was done on the occasion of the previous meeting of the institution at Ayr.

EXPERIMENTAL ROAD LENGTHS.

On the following morning the members proceeded on an inspection of the experimental stretches of road which have been laid outside the town, on the Ayr to Galston road. There are ten stretches, each 100 yds. in length, and of an average width of 19 ft. 6 in. The metal applied throughout was basalt rock from Hillhouse Quarry, machine-broken and screened to a uniform 2-in. stone, except in three cases. The sections are as follow:—

No. 1.—Ordinary macadam, as used in the district.

No. 2.—Ordinary macadam surface, tar-sprayed with distilled tar, Road Board No. 2, at the rate of 1 gallon to every 5 super. yds., the surface being gritted with ⅜-in. to ½-in. mesh chippings, 1 ton covering 120 super. yds.

No. 3.—The surface coated as before, dry-rolled, and grouted with pitch mixture consisting of 1 ton of pitch to 60 gallons of oil and sand. The pitch, after

being melted, was raised to a temperature of 300 deg. Fahr. Clean, sharp pit sand, heated on sand heaters to a temperature of 400 deg. Fahr., was mixed with the pitch and oil in a mixing vessel, in equal proportions, by measurement, of the heated pitch mixture and hot sand, and the mixture was kept continuously stirred in the boiler before being emptied from pouring cans on to the road to fill up the voids in the aggregate, and rolled immediately. The chippings—about 5 per cent—were applied before and during the rolling operations, the quantity of mixture required to grout the coating being about 1¾ gallons per square yard. The preparation and laying of this mixture, on account of the high temperatures and the want of special plant, made it very difficult to handle.

No. 4.—Similar to No. 3, except that there was no sand added to binder.

No. 5—Similar to No. 3, except that the grouting was composed of 1 part of Trinidad Epuré asphalt and 2 parts tar. The asphalt slowly melted and tar added. The grouting was well sprayed into the aggregate, and the surface immediately sprinkled with ½-in. whinstone chippings. No sealing coat was applied.

No. 6.—Surface coated with 3 in. of tar-macadam, composed of whinstone broken to the British Standard Specification for 1½-in. gauge, 11 gallons of tar, No. 2, being mixed with 1 ton of stone, and lightly rolled. The surface spread with 10 per cent of ¾-in. to ½-in. chippings, and sealed with No. 2 Road Board tar and gritted with ¼-in. whinstone chippings, rolled; 1 ton of chippings to 100 sq. yds.

No. 7.—Same as No. 6, except surface sealed with Trinidad Lake bitumen.

No. 8.—Same as No. 6, except surface sealed with Mexican bitumen. The sealing was composed of 90 per cent Fluxphalte and 10 per cent Mexphalte, heated, and applied by small Fluxphalte sprayer, then covered with ¼-in. chips, 1 ton covering 150 sq. yds.

No. 9.—Same as No. 5, except the matrix was mixed with the metal (similar to concrete), instead of being grouted into the voids of the new metal, a similar quantity of chips being used.

No. 10.—Rocmac. The Rocmac was mixed in the proportion of ½ cub. yd. of limestone and 5 gallons of Rocmac solution to 1 ton of metal, and turned over with the metal and spread 3 in. thick on road, and rolled and sprinkled with water until the Rocmac grouted the interstices of the metal.

The county road surveyor, Mr. Allan Stevenson, says it is interesting to compare results at present, but that, as the experiments are to be carefully watched, and the conditions of each noted every week, it is not practicable to arrive at a definite conclusion.

MINERS' COTTAGES.

Leaving the experimental road lengths, the visitors were conveyed to Glenburn, near the famous golfing town of Prestwick, where 186 flatted cottages for miners, designed by Mr. Allan Stevenson, the county road surveyor, have been erected by the firm of Wm. Baird & Co. for their employees. Baths and washhouses—a separate building—are a feature of the scheme, and the arrangement of the interior of these was examined with much interest. During the stay we gathered that the cost of a two-roomed cottage, with kitchen and scullery, was £245, and that of a cottage of one room, with kitchen and scullery, £190, this figure including roads and pavements, but not land. No attempt appears to have been made to provide gardens for the tenants of these by no means commodious dwellings, and this seems a matter for regret. Certainly there is ample open space around the cottages, but there are, doubtless, even among those engaged in the industry of mining, not a few who would appreciate the advantage of a plot of ground, however small, attached to their living places. As it is, fresh air and exercise are obtainable only in a sort of common playground, which, as the members of the institution saw it on the occasion of their visit, was not altogether pleasing to the eye.

HILLHOUSE QUARRY.

From Glenburn the visitors passed on to the Hillhouse Quarry, where, after a tour of the stone-crushing and tar-macadam mixing plants, blasting operations were carried out for their special benefit, large masses of the rock face being dislodged by the charges. In the neighbourhood of the quarry are some remarkably beautiful rock gardens, and by the courtesy of Mr. Baird Thorncroft these were thrown open to the inspection of the members.

At Troon the party were the guests of the quarry company at luncheon.

Later in the afternoon the members motored to Ness Glen, the journey being made by way of Patna and Dalmellington. A delightful walk to the head of the glen brought the party to Loch Doon, whence the return journey was commenced. A halt was made for tea at Dalmellington, and Ayr was reached again in the early evening.

MUNICIPAL COAL CONTRACTS.

QUESTION IN THE HOUSE.

On the 9th inst., in the House of Commons, the President of the Local Government Board was asked whether he was aware that the Glasgow Corporation, in their new coal contract, had been obliged to pay increased prices of from 60 per cent to 70 per cent; whether he would obtain information as to the prices at which the municipal authorities had renewed their coal contracts for this year; and whether, in view of the position being created for some of the vital municipal and industrial enterprises, he would endeavour to get enforced the main recommendations of the Departmental Committee on Retail Coal Prices.

Mr. Runciman, who replied, said that, as he had stated at various times, effect had already been given to the majority of the recommendations of the Departmental Committee, and he was in negotiation with colliery owners with reference to the pit-head prices of coal. He would consider the suggestion that information should be obtained with reference to the contract prices for coal paid by municipal authorities.

The Holidays Question.—In view of the probability that, owing to the conditions now prevailing, difficulty may be experienced in obtaining satisfactory substitutes, the Main Drainage Committee of the London County Council express the view that, in all cases where it is necessary, the services of the members of the staff under their direction should not be interrupted by summer holidays. All men, however, who are obliged to forego their holidays will receive additional amounts equal to their usual rates of pay.

Ashton-under-Lyne, Stalybridge and Dukinfield (District) Waterworks.—Mr. Fred J. Dixon, the engineer and manager of these works, has issued his report for 1914. The report is illustrated by photographs and diagrams graphically showing the rainfall, the conditions of storage, and the consumption of water, together with views of the Dukinfield and Knott Hill reservoirs, and Chew works, while in course of construction. The sources of supply consist of three gathering grounds situate in the Pennine Chain some 4 to 5 miles due east and north-east of the town of Ashton-under-Lyne, and the total volume of water delivered from the various reservoirs into supply, including the statutory obligations as to compensation water, is 1,741,282,272 gallons. The population supplied is estimated at 148,083, and the consumption per head per day last year was 20·77 gallons.

Appointments of Municipal Employees. The Surbiton Urban District Council have received from the Local Government Board a letter relative to their circular letter of March 11th, and the suggestions therein made for the provision by local authorities of all possible facilities to persons in their employ for joining the Army or finding employment in those occupations which are of paramount importance during the present war. The board reminded the council that in the letter it was pointed out that it would be necessary to economise labour to the greatest possible extent, and, where substitutes are needed, to engage only men who are not eligible for the Army or suited for the special occupations in question. The board accordingly now suggested that whenever vacancies occurred, and it was unlikely that candidates suitable for permanent appointment who were not eligible for the Army or for special work in connection with the war could be obtained, the local authority should consider first whether it would be possible by a rearrangement of duties among other officers to avoid any fresh appointment during the period of the war; and that if this should be found impracticable, they should endeavour to secure the services of any retired officer with the requisite experience who might be able and willing to act during that period. Failing this they should engage persons temporarily who are not eligible for the Army or the special occupations.

The Surveyor

And Municipal and County Engineer.

Bungalows for Workmen.—At a meeting of the [illegible] Rural District Council [illegible] a report from a committee [illegible] dwellings was received [illegible] A member proposed that temporary buildings in the way of wooden bungalows should be erected, and it was resolved to ask the Local Government Board for sanction to provide dwellings of this type.

Acid Wastes in Sewers.—Mr. Shelley, chairman of the Walsall Sewage Farm Committee, on Monday made reference to the discharge into the public sewers of trade refuse. He said that the refuse was of such a nature that the new plant which had been installed at the purification works might have been ruined. It should be made clear to manufacturers that the council had drastic powers for dealing with people who made an unreasonable use of the public sewers. The opinion was expressed that, as there had been previous complaints as to the discharge of waste acid into the public sewers, the committee should take steps to ascertain the worst possible, and should institute proceedings.

Trade Refuse Removal Charges.—At their meeting on Wednesday the Chiswick Borough Council had before them a recommendation that in future the charge for the removal of trade refuse should be 3d. per bushel, or 7s. 6d. per load. The Works Committee, in submitting the proposal, intimated that they had received from the borough engineer, Mr. [illegible], a report showing that there had been a large increase in the amount of this class of refuse collected during recent months—approximately 50 per [illegible], and that, as the present charge of 2d. per bushel or 5s. 6d. per load did not cover the expenditure, an additional loss would result unless the charge for removal was increased.

Air-raid Precautions.—The Commissioner of Police of the Metropolis has issued a letter pointing out that when attacks by hostile aircraft occur attempts are made to start fires by dropping chemical substances which ignite during their passage through the air, or on reaching the ground, and which could not satisfactorily be combated with water. The letter went on to say that a practical method of dealing with such fires was to smother them with sand, and it was suggested that quantities of sand for this purpose should be provided by local authorities at as many centres as possible. It was further hinted that tripods and poles for use in preventing traffic along thoroughfares in which buildings are damaged by bombs and left in a shaken and dangerous condition should be kept in readiness for use in case of emergency, as well as shoring and hoarding materials.

THINGS ONE WOULD LIKE TO KNOW.

(Contributed.)

Will any practical result follow the forthcoming Road Conference which is about to be held in London? Did any result follow the three International Road Congresses in Paris, Brussels, and London, which were attended by delegates from all parts of the world? Is not one of the great advantages of such conferences, however, that, although there may not appear to be any immediate result, or any great scheme for road construction put forward, the fact of engineers and surveyors meeting and comparing their experiences tends to advancement, and prevents them from becoming "narrow" and working only in grooves? Is not "tracking" as much to be deprecated with road men as with vehicles?

* * * *

Is it not an axiom that noise requires an expenditure of power for its production? If this is so, is it not evident that when traffic makes an excessive noise on any given surface of a carriageway there must be a considerable loss of power in producing this noise which might be more usefully and economically employed in propulsion? Should not a noiseless road surface and a noiseless vehicle be the aim of every one who is studying the problem of road traffic?

* * * *

Is it not interesting to note by the recently issued report of Mr. Wm. Oxtoby, the borough engineer of Camberwell, that the cost of "slopping" or scavenging his streets for 1914 was nearly £50 a mile less than it was thirteen years ago? Does not this point to the fact that improved road surfaces not only lessen the cost of maintenance, make traction easier, and improve the health of the community, but also in the end lighten the burden of the ratepayers? Shall we not all some day realise that the introduction of self-propelled traffic was really a blessing in disguise to our roads?

* * * *

Are not the results of the practical investigation of the ventilation of the technical schools at Worcester by Dr. J. N. Friend, D.Sc., the head master, of peculiar interest? Is it not rather remarkable that, in connection with this subject, so few scientific studies have been made in a practical manner? Are not Dr. Friend's conclusions as to the height of the ventilating shaft, governed by the heat producing the draught, of great value? Is it not to be hoped that Dr. Friend will continue his excellent experiments?

* * * *

Are there not a large number of scientific men in this country who would gladly give their services to the Government for the purpose of initiating new weapons of warfare, or to the improvement of munitions of war, if they could only be informed in what manner they could assist? Would it not be an excellent plan if the Government could organise special committees of experts to investigate and report on such subjects as the Government, the Admiralty, or the War Office delegated to them for a report?

* * * *

Is not Mr. Wallace E. Riche, the energetic secretary of the Roads Improvement Association, to be congratulated in his endeavour to make women take an interest in the question of roads, as set forth in his article on the subject in the *Auto Motor Journal* of the 3rd inst.? Is he not quite right in his remark that "it is woman who stimulates movements and reforms," and is it not a fact that women are often more observant than men in many matters? If [illegible] to become critics of our roads, is it not to be feared that the lot of the road surveyor will be even more trying than it is at present, if that *is* possible?

* * * *

Is it a fact that, in connection with the forthcoming Road Conference, several French and Belgian experts will attend specially to see if they can learn anything that will be useful to them hereafter when the question of the restoration of the roads of their respective countries will have to be taken into account after the damage caused to them by the war has ceased? The question is: Shall we be able to help them with practical suggestions? How can that be done unless we have local knowledge?

Assistants' and Students' Section.

Conducted by SYDNEY G. TURNER, Assoc.M.Inst.C.E.

All communications in regard to this page must be addressed to The Editor, St. Bride's House, 24 Bride-lane, Fleet-street, E.C. *Envelopes must be marked "Assistants' Section" in the top left-hand corner. Correspondents are invited to submit questions for consideration and answers to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.*

THE MONTHLY PREMIUM.

The following books have been chosen in respect of the premium for May, and they have been duly forwarded to the recipients:—

Mr. M. T. Roberts, of Rhyl, selected "Public Health Law," by Sydney G. Turner (St. Bride's Press, Limited); and

Mr. J. Watson, of Leeds, selected "Graphic Statics," Parts I. and II., by G. F. Charnock (J. Halden & Co., Limited).

QUESTIONS.

This week answers are invited to the following questions:—

485. Building Construction.—A casement window-frame is to be fixed in a cavity wall (10-in. stone facing, an inner facing of bricks, and a 2-in. cavity). Show clearly the methods of fixing, and any important features with respect to the relation between the window-frame and the cavity. (Mercian.)

486. Sewage Ejectors.—How would you test the efficiency of a pair of 100-gallon alternating sewage ejectors with motor-driven air compressors? (C. A. B.)

487. Structures.—Find, graphically or analytically, the maximum deflection in a steel lattice girder of the N type, supported at each end, under a load of W tons applied on the bottom boom at a distance of 24 ft. from one support. Span of girder, 72 ft.; six 12-ft. bays; depth of girder 10 ft. Take safe intensity of stress in the members as 5 tons per square inch, and Young's modulus E 13,000 tons per square inch. There is no counter-bracing. Neglect the weight of the girder itself. (B. K., *Newport.*)

488. Timbering. Describe and illustrate by a cross-section the timbering of a trench in bad ground 24 ft. deep and 4 ft. wide.

489. Road Making.—What is the best material from which to make paving setts for use in a carriage way of steep gradients? Give reasons.

[The Editor is at all times glad to hear from readers who desire to submit questions regarding matters of general interest, points of daily practice, &c., for insertion in the "Assistants' and Students' Section." Questions which are published are taken into consideration, as well as other matter, in awarding the Monthly Premium.]

REPLIES TO QUESTIONS.

483. Bridge Construction.—How are the lengths of the four wing walls of a bridge and the horizontal angle between the bridge and each wall determined? ("Tico.")

In bridge design the determination of the angle which the wing walls make with the lines of the abutments in plan is entirely a question of economy, in which the cost of land at the site of the bridge, existing property, availability of material to form approaches, rights of way, &c., have to be considered. Wing walls serve as retaining walls supporting the earthen embankments which form the approaches to the bridge. In an over-line railway bridge, with the railway in cutting, it would in all probability prove most economical to construct the wing walls at right angles to the abutments, if the foundations near the surface of the cutting proved to be suitable; the wing walls would thus act as counterforts to the abutments, assisting the latter to take the thrust if the bridge consisted of an arch or series of arches. The economy of this method of arranging the wing walls depends upon the depth of the cutting; if the cutting were shallow, say less than 12 ft. deep, it would be better to turn the walls so that they make an angle of 135 deg., or thereabouts, with the abutments. If there is no cutting, and a raised approach is necessary, then, with land comparatively cheap, and sufficient area and material available for forming the embankment with its side slopes, the usual plan is to construct wing walls nearly parallel to the abutments. The walls would end in a newel post built at the foot of the slopes, and they should be preferably curved more or less in plan. If built straight the pressure from behind may cause a curvature of the wrong kind, and a very ugly effect will be produced. It is clear from the above that the lengths of the wing walls will depend upon the type of construction adopted. The finished slopes of the bank should end a foot or two behind the coping of the walls. However, if the site lay in an urban area, where land is valuable, other methods of forming the approaches would probably be adopted, for a high embankment with side slopes of 3 or 2½ to 1 occupies a considerable area. By arranging the wing walls at right angles to the abutments, as in the case of the railway cutting, and extending them onwards to support the embankments, we avoid the necessity for side slopes, and the amount of land required is thus considerably reduced. Of course, against this we have the cost of long retaining walls; but it should be remembered that the available area in towns is often very limited. Existing property, and rights of way, &c., which might be affected, entailing considerable sums of money for compensation for damage thereto, may compel the engineer to adopt a design which, under other circumstances, would not be desirable. In towns and other thickly populated areas, a favourite method is to build the approaches in the form of a viaduct or series of arches. This is a lighter construction than that of the solid embankment, has a better appearance, and can be so arranged that existing roads, paths, or other means of communication are not interfered with. (M. T. R., *Rhyl.*)

484. Hydrostatics.—A square sluice opening, 3 ft. by 3 ft., is formed in the vertical face of a dam, and the upper edge of the opening is 6 ft. below water. Calculate the hydrostatic pressure upon the square area, and find the exact position of its centre of action. (A.M.I.C.E.)

Suppose the opening to be closed by a sluice valve, then the thrust on the valve = weight of a column of water whose base is the area of the valve × by the depth of centre of gravity of the valve below the free surface—

$$\text{i.e., Thrust} = 62.5 \times 9 \times 7.5$$
$$= 4218.75 \text{ lb.}$$

∴ Hydrostatic pressure on area = 4218·75 lb.

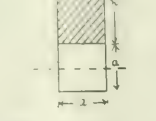
It is now required to find the centre of pressure or centre of action.

$$x = \frac{K^2}{\bar{x}}$$

where x = depth of c.p. below water surface

K^2 = (radius of gyration)² round surface line

$\bar{x}$ = depth of c. of gravity



By Rowth's Rule

$$K^2 = \left(\frac{a}{2}\right)^2 + \left(h + \frac{a}{2}\right)^2 = \frac{a^2 + 3ah + 3h^2}{3}$$

and $\bar{x} = h + \frac{a}{2} = \frac{2h + a}{2}$

$$\therefore x = \frac{a^2 + 3ah + 3h^2}{3} \times \frac{2}{2h + a} = \frac{2(a^2 + 3ah + 3h^2)}{3(2h \times a)}$$

Substituting the figures given $a=3$ and $h_0=6$ we get

$$k=\frac{2\,(9+54+108)}{3\,(12+30)}\cdot\frac{342}{45}=7{\cdot}6\text{ ft.}$$

∴ Centre of action = 7·6 feet below water level.

(J. G. W., *Downpatrick*.)

Consider an elemental strip at a depth of x ft. of width Δx ft.

Pressure at the level of the strip

= weight of x cub. ft. of water per sq. ft.

$=62{\cdot}5\,x$ lb. wt. per sq. ft.

Area of strip $=3\,\Delta x$ sq. ft.

∴ Thrust on strip $=62{\cdot}5\,x\times3\,\Delta x$ lb. wt.

$=187{\cdot}5\,x\,\Delta x$ lb. wt.

∴ Total thrust on rectangle $=\sum_{x=6}^{x=9}187{\cdot}5\,x\,\Delta x$ lb. wt.

$$\therefore\text{ Thrust}=\int_6^9 187{\cdot}5\,x\,dx$$

$$=187{\cdot}5\left[\frac{x^2}{2}\right]_6^9$$

$$\frac{187{\cdot}5}{2}\,(81-36)$$

$$\frac{187{\cdot}5\times45}{2}$$

4218·75 lb. wt.

Also by the formula $p=\bar{x}\,w\,a$,

where p = total thrust

$\bar{x}$ = head on the centre of gravity

w = weight of liquid per unit volume

we have $p=7\tfrac{1}{2}\cdot9\cdot62\tfrac{1}{2}$

$$\frac{15\cdot9\cdot125}{4}$$

$$\frac{16875}{4}$$

$=4218{\cdot}75$ lb. wt.

To find the position of the centre of pressure, which is obviously on the centre line of symmetry, take moments about the line of water-level.

Thrust on elemental strip $=187{\cdot}5\,x\,\Delta x$

∴ Moment of this thrust about water-level

$=187{\cdot}5\,x\,\Delta x\,x$ ft.-lb.

The sum of the moments of all the thrusts

$$=\int_6^9 187{\cdot}5\,x^2\,dx$$

$$\left[\frac{187{\cdot}5}{3}\right]_6^9$$

$$\frac{187{\cdot}5}{3}\,(729-216)$$

$=513\times62{\cdot}5$ ft. lb.

We have already shown that the resultant thrust is

$$\int_6^9 187{\cdot}5\,x\,dx=\frac{187{\cdot}5\times45}{2}$$

$=4218{\cdot}75$ lb. wt.

Let d be the distance in feet of the centre of pressure below the water-level.

Then moment of resultant thrust $=4218{\cdot}75\,d$

$$\therefore\ 4218{\cdot}75\,d=62{\cdot}5\times513$$

$$\therefore\ d=\frac{62{\cdot}5\times513}{4218{\cdot}75}=7{\cdot}6\text{ ft.}$$

We can obtain this result from the formula

$$h=\tfrac{2}{3}\left(\frac{h_1^3-h_2^3}{h_1^2-h_2^2}\right)$$

where h = head on centre of pressure

h_1 = head on upper edge of rectangle

h_2 = " lower " "

$$\therefore\ h=\tfrac{2}{3}\left(\frac{9^3-6^3}{9^2-6^2}\right)$$

$$=\tfrac{2}{3}\left(\frac{729-216}{81-36}\right)$$

$$=\frac{2\times513}{3\times45}$$

$=7{\cdot}6$ ft.

or from the well-known expression

$$h=\frac{\sin^2\theta\,K^2+h_0^2}{h_0}$$

where h = head on centre of pressure

h_0 = head on centre of gravity of rectangle

θ = angle which rectangle makes with the horizontal

K = radius of gyration of rectangle about a horizontal axis through the centre of gravity.

Substituting, we have

$$h=\frac{K^2+h_0^2}{h_0},\quad\text{since }\angle\theta=90$$

$$\frac{\left(\frac{3}{\sqrt{12}}\right)^2+\left(7{\cdot}5\right)^2}{7{\cdot}5}$$

$$\frac{\frac{9}{12}+\frac{225}{4}}{7{\cdot}5}$$

$$\frac{\left(\frac{675+9}{12}\right)\frac{2}{15}}{2}$$

$$\frac{684\cdot2}{12\cdot15}=7{\cdot}6\text{ ft.}$$

The centre of pressure will therefore be 7·6 feet below the water-level and 7·6—6, *i.e.*, 1·6 feet below upper edge of submerged rectangle.

(B. K., *Newport*.)

CHEAP ROADS AT HORNSEY.

BITUMINOUS SURFACING AT WATER-BOUND PRICE.

The ratepayers most pleased and comfy on their streets will be those of Hornsey this year, but the next best will have an opportunity of inspecting some of the results of up-to-date road carpeting.

The [illegible] engineer, has made much overworked old labour-saving machinery [illegible] engineering, but it is no exaggeration to suggest that the work now being carried out by Mr. H. J. Lovegrove, the borough engineer of Hornsey, will ultimately lead to an entire change in the methods of road surfacing in urban districts. In brief, Mr. Lovegrove has produced a bituminous road carpet from prepared destructor clinker which, he claims, need not exceed in cost the ordinary water-bound macadam. This new carpet has all the properties that are conducive to long life—homogeneity, absence of brittleness, resiliency, and freedom from tendency to disintegrate in bad weather. Time alone will prove the life of this surface, but the [illegible] which will be kept in repair by moderate attentions and the heavy wood pavements rains of last winter, gives ground for the highest optimism.

In his earlier experiments Mr. Lovegrove milled his [illegible] resembled sand in its tendency to wash out in the winter. Now the clinker is pulverised and sifted, the [illegible] is used for filling and the finer for the carpeting. This fine material grades in highly [illegible] from a grain which refuses a [illegible] to be rubbed down to impalpable powder.

The binder now employed is the variety of Mexican bitumen known as Mexphalte. This is mixed while hot. Mr. Lovegrove's practice is to clean his old road surface, fill in the holes with the coarser material, and "carpet" with the finer mixture to a depth of 1¼ in. to 1½ in.

The road now being surfaced is the Ferme Park-road, running parallel with the Great Northern Railway between Hornsey and Harringay; another, surfaced last year, and now subjected to a three minute omnibus surface, is Park-road, Cranley-gardens. The latter shows no wear round the manholes, and in summer consistency might be taken for hard rubber. It is a fine specimen of road surfacing, and is estimated by the borough engineer to return its money if it lasts but three years.

The plant at Hornsey is at present of the make-shift order. Even now Mr. Lovegrove claims to carpet his roads at a charge of 2s. 3d. for the carpet itself, or 3s. 3d. including preparation. With a scientifically arranged plant, such as he now has in view, these costs will be reduced to the "water-bound" level.

Advocates of resiliency will also find in Hornsey an excellent example supporting their theories. This is a thoroughfare (the Fortis Green-road), an 18-ft. road, carrying 700 motor omnibuses a day, surfaced by private contractors on a foundation of destructor clinkers.

Brighton and Hove Trackless Trolleys.—The Hove Town Council at their last meeting received a report from the Legal and Parliamentary Committee having for its object the postponing till after the war of further proceedings connected with the establishment of trolley traction for the borough.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of Surveyor readers with a view to making the information given under this head as complete and accurate as possible.

INQUIRIES HELD.

Mansfield T.C. (June 1st. Mr. Raymond Unwin).—This was an inquiry into the application of the corporation for authority to prepare a town planning scheme.—The town clerk, Mr. J. H. White, explained that the application was in regard to two areas—the smaller one adjoining Chesterfield-road, and the larger one practically including the whole of the unbuilt-upon eastern part of the borough. A meeting of the owners had been called, and at that meeting there was no opposition whatever to the scheme. The only feeling expressed was that the scheme did not go far enough, and instead of including only half of the area the whole of the undeveloped land in the borough should be included. The council were not adverse to an additional scheme, and the borough surveyor, Mr. T. P. Collinge, prepared necessary plans; but it appeared to the town council that in order to present a satisfactory scheme for the north-western part of the borough it must embrace part of the urban district of Mansfield Woodhouse. The council of that district was approached with a view to joint action, but, unfortunately, with no satisfactory result, that authority feeling that if there was to be any scheme they should prepare one of their own. It was also considered desirable that that part of Blidworth in which Rainworth was situated should be included in the scheme, and the Skegby Rural Council were communicated with as it was felt desirable to proceed on similar lines. The Skegby Council decided to proceed in the matter, but he did not know if they had a scheme as yet. With regard to the smaller area to be dealt with, this was close to the built-upon portion of the town. Mr. T. P. Collinge, formerly borough surveyor, and now holding a similar position at Rotherham, gave details concerning the areas.

Seaton Delaval U.D.C. (June 10th. Mr. George L. Pepler).—At this inquiry, with respect to an application for a town planning scheme, the clerk to the council, Mr. W. D. Soulsby, said it was proposed to include 2,640 acres of their total of 4,454 acres in the development of the scheme. He drew attention to the local signs of development, and said that at Seaton Sluice and Old Hartley the council anticipated the development of a popular seaside resort. At present there was old property in that district which might be in the way.

Stafford T.C. (May 26th. Mr. A. G. Drury).—£19,000 for sewage disposal works.—The borough engineer, Mr. W. Plant, stated that the farm had been in a bad condition for the last four years. Giving details as to the new scheme, he said that their present average dry-weather flow of sewage was 645,000 gallons per day. Owing to inability to rest any portion of the land for a sufficient period, nitrification had gradually diminished during recent years, so that the whole area was more or less sewage sick, and great difficulty was experienced in getting the sewage through the land. No other suitable land was available in the vicinity, even were it desirable to extend the present system on an area situate so near the town. Experiments had shown that the sewage could be treated efficiently on bacteriological lines. In designing the new works, he had based his calculations on a dry-weather flow of sewage of 700,000 gallons per day, which allowed for an increase in the present population draining to the works of 2,300. He esti-

Whitley and Monkseaton U.D.C. (June 11th. Mr. George L. Pepler).—This was an inquiry into an application for authority to prepare a town planning scheme for the still undeveloped area in the district and partly within the urban district of Earsdon.—The application was made under Part II. of the Housing and Town Planning Act, 1909. The clerk, Mr. A. Whitehorn, stated that the area of the land included in the town planning scheme was 1,858 acres, and included 180 acres in the Earsdon urban area. The Whitley surveyor, Mr. A. J. Roussel, gave details as to new arterial roads embodied in the scheme. One of these proposed roads would, he said, improve the approach to the district from the west, and it was in order to show this road that they included the 180 acres of land in the Earsdon district. Mr. T. Bertram (on behalf of the Earsdon Council) asked that the 180 acres of land in that council's area should be deleted from the scheme.

APPLICATIONS FOR LOANS.

Barrow-in-Furness T.C.—£2,000 for extensions to the refuse destructor.

Bristol T.C. — £26,949 for a 6,000-kw. turbo-alternator.

Bristol Burial Board.—£10,970 for the provision of a cemetery.

Cork R.D.C.—£2,500 for the provision of wells and pumps.

North Derbyshire Isolation Hospitals Committee.—£16,750 for convalescent wards at four hospitals.

Rochdale T.C.—£4,400 for electricity mains.

Spenborough U.D.C.—£2,320 for retorts for the gas-works.

LOANS SANCTIONED.

Heywood T.C.—£1,731 for the purposes of a council school.

Littlehampton U.D.C. — £2,994 for an isolation hospital.

Louth T.C.—£527 for a steam roller.

Newry No. 2 R.D.C.—£1,000, supplemental loan for the erection of cottages.

Saffron Walden R.D.C.—£400 for the purchase of sites for the erection of houses.

Southampton T.C.—£1,085 for a motor fire engine.

FORTHCOMING INQUIRIES.

JUNE.

	£
21.—**Reigate.** For the purposes of paving, road improvement, police and fire stations, and electricity (Mr. F. H. Tulloch)	19,000
23.—**Darlington.** For the purposes of the electricity undertaking (Mr. H. Shelford Bidwell)	34,950
24.—**Middlesbrough.** For the purposes of the floating hospital (Mr. H. Shelford Bidwell)	2,250

Arterial Roads in Greater London.—A meeting of the Southern Sectional Conference will be held to-day (Friday) at the Local Government Board offices, at 2.30 p.m.

Oxford Roads.—Clarmac Roads, Limited, Hennam House, Westminster, write with reference to paragraph 3, "Things One Would Like to Know," in our last issue: "We have much pleasure in informing you that the roads in and around Oxford should shortly be in a very good condition, as the city surveyor has placed an order with this company for at least 300 tons of Clarmac for his roads."

Business Announcement.—Wailes Dove Bitumastic, Limited, 49 Blackfriars-street, Manchester, write: "Mr. Lawson having joined H.M. Forces, Mrs. Lawson, who has had previous commercial experience, has voluntarily offered to step into the gap. We have cordially accepted her services, and now confidently appeal for the continuance of the esteemed orders and business so kindly accorded to her husband in the past."

Cost of London Tramway Strike.—The tale of the recent London tramway strike is told in the receipts, as presented to the County Highways Committee. These amounted, in the week ended May 19th, to £22,460, as compared with £44,960 in the corresponding week of last year. For the following week the receipts again showed an enormous falling off—from £43,760 to £12,610. In the succeeding week again there was a decline from £47,340 to £23,580. There was thus a loss in receipts of over £77,000. In the week ended May 26th the number of passengers carried was 2,877,000. In the corresponding week of last year it totalled 10,437,000.

Municipal Employees and Munitions.—With reference to the appeal made to Local Authorities to release employees for increasing the output of munitions of war, the Local Government Board have notified that the names of a large number of men whose services might be available have been sent to the War Office. They add: "It may not be easy to absorb at once slowly unskilled labour in work much of which is of a highly technical character, but arrangements have been made for an official of the Board of Trade to assist in demands. In communicate with the councils' officials and arrange with them as to the engagement of suitable men."

Municipal Work in Progress and Projected.

The Editor invites the co-operation of SURVEYOR *readers with a view to making information [illegible] complete and accurate as possible.*

The following are among the more important projected works of which particulars appear below: Buildings—Warrington; housing and town planning—South Shields; roads and materials—Monaghan, Seaford; sewerage and sewage disposal—Chester-le-Street, Leeds, Leek; water, gas and electricity—Croydon, Holywood, St. Pancras, Salford. Particulars of other projected works will be found on our "Local Government Board Inquiries" page.

BUILDINGS.

Bolton T.C.—Vice-Chancellor Stewart Smith, K.C., gave judgment at the Manchester Chancery Court in an action brought by the Duchy of Lancaster and the Bolton Pure Ice and Cold Storage Company, Limited, against the Bolton Corporation to prevent the expenditure of the borough funds in the provision of cold storage facilities and the manufacture of ice, otherwise than for the benefit of market tenants. The Vice-Chancellor said the corporation were by statute authorised to provide a market with all such approaches, works, and conveniences as they thought fit, and it was admitted by the plaintiffs that the supply of cold storage and ice was a convenience to the market, but it was argued that in so far as it exceeded the requirements of the tenants the corporation were going outside their powers. He concurred in that view.

Dulverton R.D.C.—It is proposed to build an isolation block, at an estimated cost of £100.

Dunbar T.C.—It has been decided to borrow £1,800 to meet the cost of a new wall which is being built up along the south side of the Castle Park. The council have also had under consideration a report from the burgh surveyor, Mr. A. Moody, concerning the state of the north wall of the new harbour, and it has been decided to carry out important repairs there in order to protect the structure from further havoc by the [illegible] sea. So far as [illegible] minor repairs are concerned, these are not to be proceeded with till a later stage.

Hucknall U.D.C.—The council have received the public hall and a piece of land in the Elliott estate. The value of the buildings is estimated at about £2,000.

Leith T.C.—Leith Public Health Committee have resolved to delay proceeding with the scheme for the erection of a sanatorium at Leith Public Health Hospital in view of the circumstances arising out of the war.

Surrey C.C.—Plans are being prepared for a proposed tuberculosis dispensary at Wrotham.

Tendring R.D.C.—In connection with the St. Osyth water supply scheme a tender has been accepted for the construction of the foundations of the water tower, the steelwork for which is ready.

Walsall T.C.—A recommendation has been adopted by the Tramways Committee in favour of the purchase of land in the vicinity of the tramway depot, at a cost of £900, as a site for a motor-'bus depot.

Warrington T.C.—The council have approved the plans of the borough surveyor, Mr. A. M. Ker, for the erection of a new smallpox hospital, at an estimated cost of £1,500.

HOUSING AND TOWN PLANNING.

Downpatrick R.D.C.—The council have considered an application on behalf of the contractors for labourers' cottages for an increase in the contract price, and have decided to grant £10 extra per cottage. There are 213 cottages under the present scheme.

Dunfermline T.C.—On the subject of the development of the Rosyth garden city, Bailie Norval, chairman of the Town Planning Committee, stated on Monday that a new agreement had been entered into between Lord Elgin and the committee. The town planning scheme, which has been under consideration for nearly three years, is now ready for presentation to the Local Government Board for approval.

Falmouth T.C.—It has been agreed to take up a loan of £1,500 for the fifth instalment of the housing scheme.

Greenock T.C.—Tenders are to be obtained for the erection of 150 houses in Roxburgh-street.

South Shields T.C.—It is the intention of the council to apply to the Local Government Board to [illegible] to prepare town planning [illegible] and a scheme has been [illegible] the passing of a local provisional notice. The borough engineer, Mr. L. Roseveare, has prepared a plan of the area proposed to be included in the scheme, which is about 2,000 acres.

REFUSE COLLECTION AND DISPOSAL.

Acton U.D.C.—It is proposed to instal slab-making machinery at the dust destructor, at an estimated cost of £300.

Ruthin T.C.—The borough surveyor, Mr. J. J. Price Jones, has received instructions to report upon the question of refuse disposal.

ROADS AND MATERIALS.

Acton U.D.C.—The surveyor, Mr. F. Sadler, has received instructions to carry out repairs to South-parade, Bedford Park, at an estimated cost of £150, and repairs to Lynton-road and Mayfield-road, at an estimated cost of £100.

Armagh C.C.—The county surveyor, Mr. R. H. Dorman, in his report stated that if an increased quantity of tar-macadam, Rocmac and clean, hard stone could be laid down on the roads each year in place of inferior material the surface work on the roads could be much reduced, and a larger number of the men usually employed on the roads could be put into the quarries during the summer. In that way some economy could be effected in the cost of manual labour which would help to counterbalance the increase in the cost of wages.

Chesterfield T.C.—The borough surveyor, Mr. Vincent Smith, has received instructions to prepare a report on the probable cost of a new street from Saltergate to Spencer-street.

Derry C.C.—On the suggestion of the Local Government Board, the council recently passed a resolution applying for an extension of the legal limit of road expenditure in Magherafelt rural district. The county council had forwarded a resolution asking the board to allow the carrying forward of an unexpended balance in respect of road improvements. There was no statutory authority under which the county council's proposal could be carried out, and the extension of the limit of expenditure, as suggested by the Local Government Board, was the only way of solving the problem.

East Grinstead R.D.C.—Messrs. G. Percy Trentham, Limited, wrote stating that they could not undertake the private street works in the Warren-road, Crowborough, without an alteration in their tender which increased it by about £100. It was decided to accept Messrs. Hudson's tender at £408, which was the next lowest.—Messrs. Edward Free & Sons wrote that they could not undertake private street works at Three Bridges, owing to difficulties caused by the war, and asked leave to withdraw their tender. This was agreed to, and the matter was postponed for the present.

Hessle U.D.C.—A letter has been received from the Local Government Board stating that they approve generally of the Southgate and Hull road improvement scheme, but that under the circumstances the scheme would have to stand over for the present.

Kildare C.C.—The county surveyor, Mr. J. Rorke, reported at the meeting held recently that he had been informed by the Commanding Officer, Royal Engineers, that he had recommended his superior authorities completely to reconstruct (free of cost to the county) the road between the Curragh siding and Ballymanny (known as the Standhouse-road), and also a portion of the road from the water tower to Brownstown.

Maldens and Coombe U.D.C.—The surveyor, Mr. R. H. Jeffes, has been authorised to obtain quotations for a new tip-cart.—Consent has been given to the surveyor to have portions of the main road treated with Tarvia and granite chippings, at the expense of the Trinidad Lake Asphalt Paving Company, Limited, the contractors for the maintenance of certain portions of the road.

Middlesex C.C.—The Highways Committee have had under consideration an application from the

Hendon Rural District Council that they may be allowed to lay Tarviated granite on the subsidised roads "A" and "B" in their district, and to charge the cost in their annual accounts against the county council. The county engineer, Mr. W. T. Wakelam, reported upon the application as follows: "The principle adopted and still in practice in regard to applications of the kind is to raise no objection to the use of Tarviated granite or similar material for resurfacing, and to allow the local authority to charge in their annual maintenance account an amount not exceeding the average annual cost per super. yard for maintenance in ordinary water-bound macadam." The council have agreed to the suggestion of the county engineer.

Monaghan C.C. The council last week agreed to purchase a new steam roller, provided the cost has not increased too much.—It has been decided to remunerate the assistant surveyors with a bonus at the end of the year for the additional work they have had to do under the direct labour scheme.

Norfolk C.C. The county surveyor, Mr. T. H. B. Heslop, reported recently as to the supply of granite for the roads in regard to which there had this year been considerable difficulty. Originally the committee accepted four tenders. Two of these were for seaborne materials, but it was found impossible to get granite by sea, and two other tenders were accepted. Still the four firms selected could not supply all the granite required, and it would be necessary to enlarge the number of contractors. No doubt there would be an extra charge of probably from 6d. to 1s. a ton.

Northampton T.C.—The Streets Committee recommend the expenditure of £1,000 upon the purchase of property in Bridge-street for the purpose of an improvement scheme.

Seaford U.D.C.—A decision has been reached with the military authorities on the question of the repair of the local roads. The council will pay £2,151 towards the cost of repair, and the War Office's contribution through the Road Board will be £2,009. That arrangement was submitted to the council by the Road Board and accepted subject to the concession that they be granted the money on loan free of interest for five years, and that the board pay £297 for the tarring.

Steyning West R.D.C.—Plans and estimates prepared by the surveyor, Mr. F. Slaughter, for making up Penhill-road, have been approved. The estimated cost of the road work is £2,337, and of the sewering £426.

Wombwell U.D.C. A scheme, estimated to cost £220, has been approved for widening the main road at the junction with Brampton-road. The money will be found by the county council.

SEWERAGE AND SEWAGE DISPOSAL.

Chester-le-Street R.D.C.—The improvement of the sewage disposal works has been referred to committee for consideration.

Church Stretton U.D.C.—It has been agreed to effect alterations to the storm-water tanks at the sewage outfall works, at an estimated cost of £25.

Darlington R.D.C.—It has been decided to prepare a drainage scheme for Sadberge.

Gravesend T.C.—The corporation are advised by the Local Government Board to proceed with the preliminaries of the sewerage scheme, notwithstanding that sanction cannot be given to a loan for the work at present.

Langholm T.C.—Negotiations are in progress with the Dumfriesshire County Council Committee with the view of a friendly settlement of the litigation started by the county council to compel the burgh to carry out a scheme to prevent the pollution of the river Esk at Langholm by burgh sewage. The proposal is that a modified purification scheme might be resolved on. The burgh has hitherto been opposing the suggested scheme as too expensive and unnecessary.

Leeds T.C.—On the occasion last week of the annual inspection of the sewage disposal works at Knostrop, Alderman T. Oldroyd, chairman of the Leeds Sewerage Committee, stated that the cost of the sewerage scheme when completed would be £1,277,000. The new pumping station was nearly finished, but the committee were in a difficult position in regard to that matter, as he had not yet brought before the council a recommendation that the cost of the station —some £20,000—should be sanctioned. It was, however, absolutely necessary that the station should be erected, for without it the whole of the outlay of £400,000 already expended was practically useless. It was his idea to put the whole matter before the committee at their next meeting, with the idea of gaining the consent of the corporation to the project.

Leek R.D.C.—It has been decided to carry out a sewerage scheme for Endon, and the Local Government Board is to be asked to grant a loan for the work.

Middlesbrough T.C.—At a meeting of the Sanitary Committee recently the borough engineer, Mr. S. E. Burgess, drew attention to the very bad condition of a section of the sewer draining the Corporation-road area, which has its outfall near certain works. He urged that its repair was a work of necessity, and estimated the cost at £1,000. The committee approved of the scheme, and authorised an application to the Local Government Board for power to borrow the money on the ground that it was a matter of urgency in the interests of public health. It was also agreed to invite tenders for the supply of the necessary cast-iron pipes, and to proceed promptly with the work.

Penybont R.D.C.—A letter has been received from Mr. J. T. Howell, clerk to Bridgend Urban District Council, calling attention to pollution of the Ogmore river by crude sewage, this pollution being due, it was alleged, to a breakdown in the sewage system of the Ogmore and Garw Council. Mr. T. Butler said he understood that the whole of the sewage of the Ogmore Valley and part of that of the Garw Valley was flowing into the river, and that the work of repairing the sewers and outfall was suspended, the Ogmore and Garw Council awaiting the grant of a loan. According to Mr. Eiryn Davies, the sanitary inspector, the pollution had been going on for twelve months in the Ogmore and two years in the Garw. It was resolved to co-operate with Bridgend Council in taking steps to remedy the alleged nuisance.

Sunbury U.D.C.—The council are seeking the sanction of the Local Government Board to a loan for an additional engine and compressor at the outfall works.

Surbiton U.D.C.—In February last the Local Government Board held an inquiry into an application from the council to borrow the sum of £4,900 to liquidate the balance of the "extras" incurred over the new sewerage scheme. In a letter to the council the Local Government Board have now formally sanctioned a loan of £4,875, subject to certain conditions. The £500 granted to Messrs. Dick, Kerr & Co., contractors, as a bonus to expedite the work (so that it should be completed before the expiration of the existing contract with the Kingston Town Council for the treatment of the sewage of Surbiton), is to be paid out of current rates; a term of thirty years is allowed for the repayment of interest and principal of £791, but the board stipulate that the interest and principal on the remaining £3,584 must be paid in six years. This latter sum represents the amount of the indebtedness on the superseded works at Tolworth, which the board contends should have been cleared off before the original loan for the new sewerage works was taken up.

Wolverhampton T.C.—The annual report of the Sewerage Committee on the farming operations at the Barnhurst Farm showed a balance in favour of the committee of £2,592. This financial position was attributed, in a large degree, to the excellent work of the farm bailiff (Mr. W. Craig), whose salary it was decided to increase from £200 to £280.

WATER, GAS, AND ELECTRICITY.

Aberdeenshire C.C.—The Dear District Committee have resolved to take the necessary steps to form New Pitsligo into a special water district for the purpose of a water supply.

Cardigan R.D.C.—A committee has been appointed to go into the question of a water supply for Tremain.

Castle Ward R.D.C.—The question of a water supply for Whalton is under consideration.

Croydon T.C.—The council on Monday decided to promote a Bill in Parliament to construct new wells and works a few miles to the west of the borough, and to apply the chlorine system of purification to the whole water supply. The scheme will take five years to complete, and will cost £250,000.

Edinburgh T.C.—The city council on Tuesday accepted the tender of the Stirling Boiler Company, Limited, Renfrew, at £32,286, for water-tube boilers for the new power station at Portobello.

Halstead R.D.C.—Consideration is being given to the plans of Messrs. Taylor & Wallin, Norwich Chambers, Ipswich, for a water supply for Castle Hedingham, at an estimated cost of £2,100.

Hertford R.D.C.—The council are negotiating for a water supply to Bramfield, from the Western Water Company, and are hoping to obtain sanction to a loan of £1,400 for this purpose.

Holywood U.D.C. In reply to a letter from the council, the Local Government Board have intimated that they had recommended to the Commissioners of Public Works the loan of £5,750 sanctioned to the council for the purpose of providing additional storage reservoirs. As the matter is still in abeyance, the council decided to write to the Treasury direct, putting before them the true position of affairs in the town.

Monk Bretton (Yorks) U.D.C.—It has been agreed to provide a main water supply for Westgate, at an estimated cost of £300.

Paul U.D.C. An improved water supply is to be provided for Newlyn, at an estimated cost of £3,000.

St. Pancras B.C. — The Electricity Committee recommend the borough council to make application to the Treasury for sanction to borrow £22,530 for the King's-road electricity station.

Salford T.C.—The council on Wednesday last decided to purchase additional plant for the electricity station in Frederick-road, at a cost of £16,200, in order to meet existing and future requirements, and particularly the pressing need of many large firms in need power to carry out war contracts for the Government.

Shrewsbury T.C.—There was a surplus of £785 on last year's working of the electricity undertaking, compared with £131 in the previous year.

Thakenham R.D.C.—The Local Government Board having intimated their willingness to sanction a loan for the Storrington water scheme, it is probable that immediate steps will be taken to put the work in hand.

Totnes R.D.C.—The sanitary inspector, Mr. F. Goode, has prepared plans for a new water main at Bittaford, and the Ugborough Parish Council have agreed to recommend the district council to carry out the work.

Walmer U.D.C. The water undertaking has contributed £500 to the rates as profits on the last half year's working.

Walsall T.C.—The balance-sheet of the electricity undertaking showed a net profit of £1,385 last year.

MISCELLANEOUS.

Ealing T.C.—On the subject of air-raid precautions, the borough surveyor, Mr. W. R. Hicks, reported that stores of sand had been provided at thirty-three different places within the borough, and that he had arranged for men to be at the several places without delay in case of a raid, and further that he had ordered twenty-four respirators and six chemical extinguishers for the use of the fire brigade. The action of the borough surveyor was approved.

Surbiton U.D.C.—On Monday it was agreed—on the suggestion of a member that a register of persons willing to undertake agricultural work in certain seasons should be compiled—that the chairman, Mr. S. Kavanagh, J.P., should express the views of the council at a conference on the subject which he was to attend at Guildford.

Town Planning and Engineering.—A proposal by the College School of Architecture to exclude the subject of town planning from the curriculum of the Royal Technical College, Glasgow, has been vetoed by the college governors.

Tar in Fishing Waters.—At the annual meeting of the Salmon and Trout Association in London on Tuesday it was stated that examination in regard to tar and its effects on fish life were being continued, and a large number of fish, sent by various boards and fishery owners, had been examined in order to ascertain the causes of death. This question has been considered by several of the Fishery Boards in Wales, and it is alleged that following heavy rain the tar-spray washed off the main roads found its way into the rivers. Opinions differ as to the effect of the tar on fish. Some hold that it is deleterious, while others say it is perfectly harmless. The results of expert examination are looked forward to with interest by fishermen.

PERSONAL.

Mr. F. W. Sport[illegible], engineer of York, has been elected a Fellow of the Royal Sanitary Institute.

Mr. R. Lee, manager of the Ramsbottom sewage disposal works, has been voted £50 for extra services.

Mr. P. A. Benn, city surveyor of Lichfield, has received a Sheraton drawing-room timepiece from the members of the corporation and officials on the occasion of his marriage.

Mr. D. V. Howard, engineer and surveyor to the Sandgate Urban District, was married recently to Miss C. E. Bull, only daughter of the late Mr. F. J. Bull, of Chesham, Bucks.

Mr. H. E. Bellamy, formerly resident engineer, Public Works Department, Sydney, and now naval civil engineer under the Commonwealth Government, has been elected a Fellow of the Royal Sanitary Institute.

Mr. R. V. Pierce, surveyor to the Melksham Urban District Council, having enlisted, Mr. Stanley Bolwell, son of Mr. A. R. Bolwell, surveyor to the Bath Rural District Council, has been appointed temporarily to the position. The salary is £104 a year.

Mr. Frank Darling, of Toronto, will, at the general meeting of the Royal Institute of British Architects on Monday next, be presented with the Royal Gold Medal for Architecture. This is the first time this [illegible] citizen of one of the great Dominions.

Mr. T. H. Scott, burgh surveyor of Inverness, was last week presented by the heads of the various municipal departments with a solid silver salver, a silver cigar case, and a handsome Cairngorm brooch for Mrs. Scott, on his departure to take up an important appointment at Port of Spain, Trinidad.

Mr. Reginald Brown, of 21 Old Queen-street, Westminster, and Town Hall, Southall, has been elected a Fellow of the Royal Sanitary Institute. Mr. Brown is also a member of the Institution of Civil Engineers, Institution of Mechanical Engineers, and Institution of Municipal and County Engineers, and a Fellow of the Surveyors' Institution.

Mr. Joseph Lambert Associate, M.Inst.C.E., M.R.San.I., F.I.S.E., deputy engineer and surveyor to the Tottenham Urban District Council, has been unanimously appointed acting engineer and surveyor, and Mr. Walter Vincent, the next assistant, acting surveyor to the Education Committee, during the absence of Major W. H. Prescott, R.E., M.Inst.C.E., on active service.

Mr. Wm. Cuthbertson, burgh surveyor, Moffat, has resigned his appointment, having received a Government appointment as master of works in Edinburgh in connection with the building department of the Scottish Territorial Association. Mr. Cuthbertson, who was formerly burgh surveyor at Lockerbie, has [illegible] at Moffat.

Mr. A. A. Fillary, district surveyor for Streatham West, is recommended for appointment as district surveyor of Greenwich. On the resignation, recently, of Mr. A. Conder from the position of district surveyor of the combined district of Greenwich and Woolwich, the Building Acts Committee of the London County Council divided the district into two, and decided to appoint separate officials. They invited applications from certain of the existing district surveyors, but no candidate presented himself for the Woolwich appointment, and only ten applications were received for the district of Greenwich. The committee propose to make temporary arrangements for the supervision of the Streatham West and Woolwich districts, as they are of opinion that no new district surveyors should be appointed while possible candidates are on war service.

OBITUARY.

Mr. F. E. G. Bradshaw, borough surveyor of Tamworth, died recently, we regret to state.

Mr. Richard Thomas Elsam has just died, we regret to learn, at Teddington, at the age of seventy-seven. He was for fifty-two years auditor to the Hampton Court Gas Company, and was formerly surveyor to the Hampton Wick Urban District Council.

The deepest sympathy will go out to Mr. Frank Smith, first architectural assistant in the office of the borough engineer and surveyor of Southend-on-Sea, in the death of his wife, which took place on Tuesday, following severe injuries sustained during the Zeppelin raid on the night of May 26th.

THE USE OF ELECTRIC VEHICLES IN MUNICIPAL SERVICE.*

By F. Ayton, M.I.E.E.

There could hardly be conceived a more suitable field for the employment of the electric battery vehicle than that connected with municipal service. This is because the work to be done lies entirely within the proper sphere of this particular type of vehicle—viz., short distance haulage at moderate speeds. The mileage capacity per charge—*i.e.*, 35 to 45 for the heavier vehicles—is sufficient for practically every duty which the municipal vehicle has to perform, but it must not be forgotten that, by a mid-day boosting charge, the daily mileage may be considerably increased. In fact, the only limit to the daily mileage is the time required to charge the battery, and, as the modern types of battery allow of the charging being commenced at a comparatively high rate, the time taken, especially for boosting charges, is very materially reduced from the period which used to be considered necessary. As an instance of the amount of work the electric vehicle is capable of performing, the electric street watering and sewer flushing vehicles belonging to the city of Calgary in Canada are reported to be in use for a 16-hour day at certain periods of the year, the superintendent of street cleaning stating that each vehicle had replaced five horse teams, with a resultant saving in expense of no inconsiderable amount.

Naturally, the main reason for urging the adoption of electric vehicles by municipalities is the degree of economy which attends their use in substitution for horse haulage. Wherever the electric has been employed in its legitimate sphere, the claim of economy has been proved to the hilt. In citing evidence in support of this statement, attention may be directed to the experience of that progressive city which can lay claim to being one of the pioneers in the municipal operation of the electric vehicle—*i.e.*, Glasgow—where the electricity department found that their first electric van, of 1-ton capacity, did the work of two horses, at a saving in expense and with greater efficiency; while, compared with a petrol van, which the department was previously using, the electric did the same work with a saving in expense in the neighbourhood of £240 per annum. Other evidence is afforded by the refuse collection trials at Barnes and at Heston and Isleworth, while the instance of Calgary, previously mentioned, provides an additional illustration of the financial advantages accruing from the employment of this type of road motor, the daily saving, as against horses, by the operation of two watering and flushing vans, being given as about £5.

The durability of the electric vehicle is a feature not to be lost sight of, and there is ample evidence, based upon experience, that there is justification for putting the average life of a modern vehicle of good make at not less than ten years, assuming reasonable use and proper upkeep. In the United States electric commercial vehicles built twelve years ago are still in daily service, and many seen in the streets are well over six years old.

RELIABILITY.

Reliability is another feature of the electric vehicle which must not be overlooked, for experience has shown that this type of automobile can keep the road day by day for more days in the year than any other type—in fact, records show that it is safe to estimate, in the case of a fleet of electric vehicles, that the average working days in a year for each machine will not be less than 97 to 98 per cent of the maximum possible. The reasons for this are threefold; first, the simplicity of the mechanism; secondly, the strong construction possible on this account; and, thirdly, the fact that, owing to the simplicity and fewness of the working parts, any repair or replacement can usually be effected during the night, or in such a short time as not to interfere with the use of the vehicle. The nett effect of all this is that, where several vehicles are operated, fewer spare ones need be kept than if petrol or steam machines were employed.

In the case of those municipalities that own electric supply undertakings, there is a further and very pertinent reason why they should set the example as users of electrically driven vehicles, and that is the important new source of revenue which the general use of these vehicles in any district will open up. And the value of this additional source of revenue is emphasised by the fact that the demand in connection with it need never come on during "peak-load" hours; hence it may be dealt with without requiring additional expenditure in plant, buildings, or mains. Moreover, as its effect will ever be to even out the load curve, and so lead to greater economy in the cost of generation, this will in time permit of a lower rate being charged to all other classes of consumer. Cheap electricity for all purposes should be the persistent aim of every municipal electrical undertaking, and the cultivation of the vehicle charging load is a step on the way.

* Paper read yesterday at Caxton Hall before the International Municipal Electrical Association in London.

FOR OTHER ADVERTISEMENTS

See End of Paper.

THE URBAN DISTRICT COUNCIL OF HESTON AND ISLEWORTH.

TEMPORARY ASSISTANT SURVEYOR'S DEPARTMENT.

A Temporary Assistant is required in the Engineer and Surveyor's Department of the above Council during the duration of the war.

Candidates must be non-eligible for service in H.M. Forces, and be fully qualified in level and survey.

Preference will be given to candidates with experience in the preparation of a town planning scheme.

The salary will be at the rate of £3 3s. per week.

Applications, endorsed "Temporary Assistant," and accompanied by copies of not more than three recent testimonials, must reach the undersigned not later than noon, on Tuesday, the 29th June, 1915.

J. G. CAREY, Assoc.M.Inst.C.E.,
Engineer and Surveyor to the Council.

Council House,
Hounslow.
June 16, 1915. (2,606)

URBAN DISTRICT OF FINCHLEY.

OVERGROUND CONVENIENCE, EAST FINCHLEY.

The Council of the above District invite Tenders for the Erection of an Overground Convenience in East End-road at the rear of the "Bald-faced Stag" Public-house.

The Drawings and General Conditions of Contract may be seen, and copies of the Specification and Schedule obtained, on application to the Council's Engineer and Surveyor, Mr. C. J. Jenkin, M.Inst.C.E., at the undermentioned offices, on payment of a deposit of £3, which will be returned on receipt of a *bonâ-fide* Tender for the whole of the work, together with a fully priced-out Schedule, and the return of all papers supplied.

The Council does not bind itself to accept the lowest or any Tender.

Tenders, endorsed "Public Convenience, East Finchley," to be delivered to the undersigned not later than 12 noon on the 28th day of June, 1915.

E. H. LISTER,
Clerk of the Council.

Council Offices,
Church End, Finchley, N.
June 14, 1915. (2,607)

URBAN DISTRICT OF FINCHLEY.

HUMUS TANKS.

The Council of the above-named District invites Tenders for the Construction of Humus Tanks at its Sewage Farm in Summers-lane.

Plans and Conditions of Contract may be seen, and Form of Tender, Specification and Schedules of Quantities obtained, on application to the Council's Engineer at the undermentioned address.

A deposit of £2 will be required, which will be returned on receipt of a *bonâ-fide* Tender on the prescribed Form, together with fully priced Schedules and the return of all papers issued.

Sealed Tenders, endorsed "Humus Tanks," to be addressed to the undersigned, and delivered not later than 12 o'clock noon on Monday, the 28th June, 1915.

The Council does not bind itself to accept the lowest or any Tender.

E. H. LISTER,
Clerk of the Council.

Council Offices,
Church End, Finchley, N.
June 15, 1915. (2,608)

GLASGOW'S NEW BATHS AND WASHHOUSES

REINFORCED CONCRETE CONSTRUCTION.

[illegible] the Corporation of the district of [illegible] Glasgow [illegible] new baths and wash-houses [illegible] on the Great Western Road, the institution of the public

Ferro-concrete Roof over Corridor, Washhouses, Glasgow

baths and wash-houses, the plans for which were prepared by Mr. A. B. Macdonald, M.INST.C.E., the late city engineer of Glasgow. The accompanying photographic views illustrate the Monitor Hennebique roofs over the wash-house building, the main hall, the building being covered with roofs of 26ft. span, and the corridor roof having similar trusses of 10-ft. span. As will be seen by the illustration, the trusses are connected by [illegible] purlins of the same material. All details of the work were prepared by Messrs. L. G. Mouchel & Partners, of Westminster, who were represented during the execution of the contract by Mr. T. O. Dixon, their district engineer for Scotland. The contractors were Messrs. Gray's Ferro-Concrete Construction Company, Limited, of Polloksh[illegible]

Mechanical Filtration of Water.—We find that in our last week's report of the remarks made by Mr. Martin Deacon (London) in the recent discussion at Shrewsbury on the value of mechanical filters in the purification of water a mistake which materially affects the speaker's argument occurred. In the seventh line from the bottom of the first column of p. 742 the figure of £50 appeared instead of £500, and we hasten to make the necessary correction.

Upper Renfrewshire Roads.—In his annual report and estimate of the cost of maintaining the roads under his charge for the current year, Mr. Robert Drummond, road surveyor for the Upper District of Renfrewshire, states that the roads continue to improve in strength, and that on the main roads the coating of the new metal coatings with a bituminous binder is proving an economic factor, both as regards surface wear and the reduction of wear of the bottom material. The life of the surface is prolonged, and wherever roads have been strengthened the quantity of metal to be applied may in future with safety be reduced. The tar-spraying of road surfaces, together with the binding of new metal coatings with a bituminous mixture, was carried out with good results. About 70 miles of roads were dealt with, and the expenditure under this head was £4,345, in aid of which a grant of £1,600 was obtained from the Road Board. For the current year it is proposed to spend £4,450, and a grant in aid of £1,580 has been intimated.

ACCUMULATIONS OF HOUSE REFUSE.

THE FENCING OF VACANT LAND.

A [illegible] the Housing Committee of Morley, whereat the recent Local Government Board circular regarding the accumulation of house refuse in the neighbourhood of dwelling-houses [illegible] to be dealt with [illegible] and [illegible] councils, Mr. Long stated that he was considering the issue of another circular to all sanitary authorities urging special precautions for the prevention of disease during the summer months.

In reply to a suggestion that he should urge upon local authorities that they should compel local owners to fence land which was in immediate proximity to crowded areas, the right hon. gentleman said he had no reason to believe that there was any great difficulty in connection with the subject. He would consider it, but it was rather a large order.

A Glossary of Road Terms. By H. P. [illegible], M.INST.C.E. Bemrose & Sons, Limited, 23 Bedford Street, W.C. Price 2s. net.

During the past few years the progress [illegible] roads throughout the United Kingdom has rendered it necessary to correlate the nomenclature of road [illegible] and [illegible] has compiled a glossary with the hope that it may form a basis for such a correlation.—*Times Engineering Supplement.*

Ferro-concrete Roofing over Corridor

Pressure-Scraping Fifteen Miles of Water Mains.*

By JAMES MACFADZEAN, B.Sc., Assoc.M.Inst.C.E., Assistant Burgh Engineer, Ayr.

The main pipe scraping operations carried out by the Ayr Corporation which form the subject of this paper are not in any way unique, but the whole question is one which is interesting many engineers at present, and if this paper can bring about an interchange of ideas and experiences and prove helpful in any way to those who have similar operations in prospect, it will have served a useful purpose.

The chief source of the Ayr water supply is Loch Finlas, a natural lake, situated in the upper reaches of the Doon watershed, some 21½ miles south of Ayr. The drainage area is clean and free from moss, and the underlying rock belongs to the Silurian formation.

A single line of pipes conveys the water from Loch Finlas to a 7,000,000-gallon service reservoir near Dalrymple—a distance of 17 miles. The first 2½ miles consists of 18-in. diameter fireclay pipes, laid to a gradient of 1 in 350. The remaining 14½ miles is formed with cast-iron pipes, of which 8 miles are 16-in. diameter and 6½ miles 14-in. diameter, and it is with the scraping of these cast-iron pipes that this paper principally deals.

The main was laid in 1887, and had not previously been scraped. Its original calculated capacity, assuming a discharge at the level of the present service reservoir, which was not in existence then, was 2,592,000 gallons per day. It is only, however, since 1903 that reliable measured records of this capacity are available. In that year the maximum delivery was 2,037,000 gallons per day, but by 1911 this had fallen to 1,865,000 gallons, or a reduction in eight years of 8½ per cent.

Now this delivery was nearly 1,000,000 gallons per day short of the average daily requirement during certain periods in the summer, and the deficit had to be made up by pumping from a spring water source. The yield of these springs, although ample in the winter months, sometimes fell so low in summer as to be insufficient to meet this deficit, and the town had to be put on a reduced supply.

The need for increasing the supply at once was therefore imperative, and it was decided to scrape the main in the hope that the estimated increase of 500,000 gallons per day would be realised, and delay for a little the laying of a new main.

It was known that the pipes were incrusted, because of their decreased capacity, and also because quantities of nodules came away during scouring operations, and were found in the pipes when repairs were being executed.

The relative merits of power and pressure scraping were considered, and the power-scraping was set aside on account of the prohibitive cost, and the more serious dislocation of the supply which it would cause during operations, and also because every successive scraping would cost almost as much as the first. The incrustation was comparatively soft and easily detached, its thickness was small in comparison with the diameter of the pipes, and the head of water was generally ample; so that there seemed no reason why pressure-scraping should not give good results, and it was probable that this method would do less damage to the internal coating of the pipes. The type of scraper adopted was Messrs. Glenfield & Kennedy's, and the results show that it did its work well.

When the main was first laid no provision had been made for scraping, and the first step was to divide the system, by means of hatch-boxes, into sections of a convenient length, from 1 to 2 miles, according to conditions. Fortunately, the quickest bend had a radius of 18 ft., so that these did not require to be considered. There were two short stretches where a head of 15 ft. could not be relied on, and hatch-boxes were placed at the beginning and end of these, so that the scraper might be pulled through by means of ropes or chains.

It is very important to place all hatch-boxes in positions where a large volume of water can be easily disposed of without damage to roads, fields, or adjoining properties, and where they can remain open for hours at a stretch without causing serious inconvenience. In towns they should be enclosed in built chambers, sufficiently drained, and this is advisable, though not always necessary, in the country.

It is obviously undesirable to have any hatch-box placed so that the water from a long stretch of pipe will drain back into it, and it is very important that the control of the water entering any section should be exercised as near the beginning of the section as possible. The methods of controlling the flow of water into, and draining the water from, each section should be well considered beforehand, and extra valves inserted where necessary, and all scours put into good order.

It may here be mentioned that the work of inserting the hatch-boxes and also the scraping operations were very much simplified, because the main discharges into a service reservoir holding nearly three days' supply. This made it possible for the work to be carried out during the day-time. The hatch-boxes were put in, two at a time, on alternate days, under contract, the arrangement being that the water was not to be shut off for longer than six hours on each day. This time was only once seriously exceeded. On this occasion the river Doon rose suddenly after the pipe had been cut, entered the main through the open scour valves and flooded the work, and it was nineteen hours before the hatch-box was inserted and the water could be turned on again.

During the scraping operations it is necessary to keep spare lengths of pipes, collars, and jointing materials conveniently near, so that, in the event of a burst occurring, or the scraper having to be cut out, no time will be lost. It is also essential that, in any section which is being scraped all main valves be opened wide, so as not to impede the progress of the scraper, and all service connections shut down tight; otherwise they will become choked with the incrustation. Air valves must, of course, be kept open, although there is a danger that the efficiency of these may become impaired by the washing into them of material scraped from the pipes. They should be cleaned out after the operations are finished. The air valves on this system are of an old type, and are not provided with cut-off valves; therefore they could not be cleaned afterwards without again taking all pressure off the main.

The scraping of each section under pressure was carried out in the same way. The hatch-boxes at each end were exposed, and shear legs erected over each for lifting off the covers and raising and lowering the scraper. The water was then entirely cut off the section, which was drained dry by opening all the scour valves. The covers of both hatch-boxes were then removed; a plug was inserted in the second hatch-box to prevent any material being washed past it into the next section. The scraper was next placed in the first hatch-box, and the cover bolted securely down. The water was now turned on, and when the pressure behind the scraper was sufficient, it moved off with a low rumbling sound. The work was in the country, where there was little traffic, and as the weather was favourable there was not much difficulty in following the scraper by this sound, without stethoscopes, at all ordinary depths. One man walked alongside the scraper all the way, and several others were kept posted ahead at intervals to trace it should it escape from the first man. Men were told off to shut each scour valve as the scraper reached it, and to open up again after the scraper was home. It is usually important—especially if the drainage from the second hatch-box is not exceptionally good—to have the water shut off immediately the scraper has reached it. Sometimes a field telephone is used to send back word, but in this case a system of signalling was arranged, so that no time was lost in shutting off the water. The second hatch-box was then cleaned out, and the scraper carted back to its starting point for a second run. Each section was done twice, and the time allowed for having the water off on each day was six hours. It was found possible to have the water off every day for this work, and this was a great convenience, as it gave continuous employment to the men. The 16-in. scraper weighed 3 cwts., its average speed through the pipe was about 2 miles an hour, and the head required to drive it was about 15 ft. The steepest gradient climbed by the scraper was 1 in 9½ for a distance of 980 ft., and this was done without any difficulty whatever. It is hardly necessary to mention that good pumps must be kept handy for clearing the water from the hatch-boxes, and for any emergency work.

* Paper read at the Annual Scottish District Meeting of the Institution of Municipal and County Engineers at Ayr.

In the two sections where the pressure was low the same scraper was used, but it was pulled through by means of a chain. This method was naturally much slower than working by pressure, but the operations were much the same.

The scraping was done in two portions, the 14-in. pipes being scraped in May, 1912, and the 16-in. pipes in May, 1913, and as the scraping of the smaller pipes first was possibly a mistake it should be referred to. The reason for having the larger diameter main for the first 8 miles was to raise the hydraulic pressure line sufficiently to get over the high ground between Patna and Dalrymple. The result of scraping the 14-in. pipe first was, of course, to lower the pressure line where the change in diameter occurs. This fell so much that it dropped to the pipe level at one place and broke up the whole system from there to the service reservoir into a series of inverted syphons, and resulted in the supply being cut off from certain consumers on this section. These supplies could only be restored by closing down certain valves and throwing the pressure back on the main behind. It was therefore impossible to reap any advantage from the scraping until the whole of the main had been scraped.

Both the 14-in. and 16-in. scrapers were purchased, and are available for use whenever rescraping becomes necessary, but new leads and leathers will have to be purchased every time the operations are repeated.

As will be seen from Appendix No. 1, the cost of the scraping is low. If the hatchboxes, valves, scrapers, &c., are included, the cost per mile amounted to nearly £34 for the 14-in main, and £48 10s. for the 16-in. main. The actual scraping operations on the 14-in. main were done for £13 7s. 11d. per mile, and, owing to the experience gained during this work, the cost of scraping the 16-in. pipes was reduced to £11 19s. 9d. per mile. It should be understood that the cost of scraping depends largely on the obstructions met with, and the number of times the pipe has to be cut; but it is also important that the work be organised thoroughly, so that every man knows exactly what to do under any circumstances, and that all tools are at hand when required.

The immediate results of the operations were very satisfactory. The delivering capacity of the main was increased by 681,000 gallons per day, or 36¼ per cent, thus bringing it to within 46,000 gallons per day of its original calculated capacity. Another result, of equal importance, was the securing of an increase of 30 ft. in the pressure head at the point where the main changes size. This raised the hydraulic pressure line to a stable height above the pipe.

In May of this year, exactly two years after the scraping operations, a test was carried out, and the carrying capacity of the main was found to have decreased in this time by 276,000 gallons per day—that is to-say, 40¼ per cent of the increase obtained by scraping has already been lost. There has also been a decrease in pressure head of 25 ft. where the 16-in. and 14-in. pipes join. It would thus appear that the main will require to be rescraped next year, and if the consumption increases the intervals between scraping operations must be shortened until annual scraping is resulted, and a new main or a new source will become necessary.

It often happens, when a main is first scraped, that the scraper in its course meets with obstacles—such as pick heads, crowbars, jointing tools, and the lead from badly-run joints. In these operations, however, no lost property was discovered, and this is perhaps the main reason why the operations were carried through with hardly a hitch, and without any of the usual expedients having to be adopted to coax an unwilling scraper to keep moving. It is rather remarkable that, even in a certain stretch of over ½ mile, where the main runs through a floating moss, and where, every now and then, drawn joints had to be embraced in cast-iron clips, the scraper passed through without any hesitation.

If the scraper does become stuck, the first work is to locate it, then, by an induced water hammer, or by striking the pipe, or by finally floating down a wisp of hay behind the scraper, and repeating these methods, to endeavour to get it restarted. Failing all these means the main must be cut and the obstacle removed.

The material taken from the Loch Finlas main consisted almost entirely of well-formed nodules. They varied considerably in size, up to about ⅝ in. in thickness and 2½ in. in diameter, while here and there the nodules had become confluent, and formed a continuous layer of incrustation nearly ½ in. thick. The total quantity removed could not be gauged, as large quantities of nodules were blown from each scour, besides those carried forward with the scraper.

An analysis of the Loch Finlas water is given in Appendix No. 2, and that of a sample of the incrustation in Appendix No. 3. The water is very soft, and has an acid reaction, and contains no trace of iron. The nodules contain 72¼ per cent of iron oxide, obviously formed by the action of the water on the metal of the pipe. It is, in fact, corrosion of the pipe, with the addition of organic matter deposited from the water. Fig. 1 illustrates the growth of a nodule and the consequent deterioration of the pipe. The incrustation seems to have started in the centre, at a defect in the coating, and to have grown upwards and outwards in concentric layers. Simultaneous with this growth there appears to have been an eating into the metal. This action has been inwards at first, and then spreading outwards under the coating as the nodule increased in diameter,

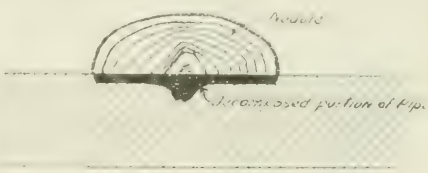


FIG. 1.—SECTION OF PIPE AND NODULE.

expanding and cracking the pipe coating in its course. This decomposed portion of the pipe, which is shown blackened in the figure, is darker in colour than the metal, and can be cut with a knife. Under a nodule of about 1½ in. in diameter the metal was decomposed for a depth of about $\frac{3}{16}$ in. at the centre, and $\frac{1}{16}$ in. over the rest of the area, but beyond the circumference of the nodule the pipe and coating were quite sound.

It would appear that, so long as each nodule is distinct, corrosion will continue at a fairly uniform rate, but after the nodules have united into a continuous layer the process will become slower as the thickness of the crust increases. Prof. J. Campbell Brown, in a paper before the Institution of Civil Engineers (Vol. 156 of "Proceedings"), stated that corrosion practically ceases when a thickness of 1 in. or 1½ in. is reached. This must depend, however, on the properties of the water and on the amount and quality of material deposited from it.

The wisdom of scraping a corroded main may well be questioned. In the present case it was done because the need of an increased supply was urgent, and the only other ways of obtaining it involved an immediate large capital expenditure. Before deciding to scrape a main the engineer should seriously consider whether the advantages to be gained will balance the deterioration due to more rapid corrosion, in addition to the cost of periodic scraping.

The solution of the problem of the corroded main would, of course, be a perfect pipe coating perfectly applied. This may come with the dawn of the Millennium, but meantime engineers, more especially those who are dealing with soft acid waters, would do well to pay more attention to the coating of pipes at the foundry. Double dipping and very careful supervision of the process might do much to prevent excessive corrosion and prolong the life of the pipes, and to a certain extent do away with the necessity of scraping. Suitable treatment of the water, such as neutralising its acidity by adding caustic soda or slight excess of lime, might make the action on the pipes less marked, but as waters vary so largely in all their characteristics, no general law can be laid down. Each supply has its own problem which must be treated by itself, and for whose proper solution the chemist should be associated with the engineer.

APPENDIX No. 1.

Costs of Scraping the Loch Finlas Main.

	14-in. main.	16-in. main.
Total length in miles	6·432	8·14
Total length in yards	11,320	14,327
Cost of hatchboxes, valves, scrapers	£131 10 10	£297 8 9
Cost of scraping pipes	86 3 0	97 11 8
Total costs	£217 13 10	£395 0 5

Inclusive cost per mile ...	£33 16 11 ...	£48 10 7
Inclusive cost per yard ...	4·615d. ...	6·617d.
Inclusive cost per yard per in. diameter	0·33d. ...	0.414d.
Cost of scraping per mile ...	£13 7 11 ..	£11 19 9
Cost of scraping per yard ...	1·826d. ...	1·635d.

The total cost per 1,000 gallons increase in daily supply was:—

Inclusive	18s.
Scraping alone	5s. 4¼d.

Appendix No. 2.

Analysis of Loch Finlas Water.

	Grains per gallon.
Total solid matter in solution	3·92
Chlorine	0·84
= Sodium chloride	1·38
Free ammonia...	0·0035
Albuminoid ammonia	0·0055
Oxygen required to oxidise organic matter ...	0·42
Total hardness ... ... 0·84 degrees.	

Appendix No. 3.

Analysis of a sample of Incrustation removed from the Loch Finlas Cast-iron Water Main.

	Per cent.
Peroxide of iron	70·00
Protoxide of iron	2·57
Alumina...	0·49
Carbonic acid	1·12
Phosphoric acid	0·43
Sulphuric acid	0·56
Silica	0·36
Water and organic matter	24·42
	99·95

SOME RECENT PUBLICATIONS.*

A Treatise on Hand Lettering. By Wilfrid J. Linehan, B.Sc., M.Inst.C.E., &c. Price 7s. 6d. nett. London: Chapman & Hall, Limited.

This book is intended as a complete manual of lettering for those for whom it has been written, the object of the author being to supply a series of alphabets suitable for mechanical, electrical, constructional and civil engineers, architects and architectural draughtsmen. It extends to some 268 pages on art paper, and is much more than a mere copybook, inasmuch as each alphabet is accompanied by clear instructions as to the best methods of forming the several letters, and as to the uses for which the particular style is appropriate. Moreover, all the exercises are carefully graduated, the letters in many cases being arranged, not alphabetically, but in order of difficulty. The usefulness of the work is greatly increased by the device of printing the instructions and exercises on opposite pages, so that the former may be read by the student while copying the latter. The book is the most complete of its kind that we have seen, and it should attain considerable popularity among students and draughtsmen.

Structural Steel Drafting and Elementary Design. By C. D. Conklin, junr. Price 10s. 6d. nett. New York: John Wiley & Sons; London: Chapman & Hall, Limited.

This work is intended as a text-book from which the draughtsman can obtain information upon the practical method of preparing shop detail drawings. The earlier chapters, which are of a general character, are followed by careful descriptions of the design and detail of several typical structures—as, for example, a steel roof, a deck plate girder railway bridge, a country highway bridge, &c. In each case the method of design is explained, and the necessary shop detail drawings are reproduced. The designs given are those most commonly met with in actual practice, and they form the basis of an excellent course in structural design and drawing for the technical school, according to American practice.

Valuations. By Samuel Skrimshire, F.S.I. Price 10s. 6d. nett. London: E. & F. N. Spon, Limited.

In the first place it must be pointed out that this is a text-book, and not a table-book. It is comprehensive in scope, including, as it does, valuations for the purpose of the sale and purchase of freehold, lifehold, copyhold, and leasehold property, assessments to duties under the Finance (1909-10) Act, 1910, the enfranchisement of copyhold estate, assessments for rating, compensation on compulsory purchase, and advances on mortgage. Intended primarily for students, a feature of the work is the large number of practical illustrations that it contains, very useful critical notes being appended to many of the solutions given. We can confidently recommend the book as an accurate and clear statement of the principles and practice of valuation, carefully graduated so as to meet the requirements of the learner.

Constant-Voltage Transmission. By H. B. Dwight, B.Sc., &c. Price 5s. 6d. nett. New York: John Wiley & Sons; London: Chapman & Hall, Limited.

In this book the author discusses the use of synchronous motors for eliminating variation in voltage in electric-power systems. His avowed purpose is to urge that more synchronous motors should be installed in alternating current power systems, but he has, nevertheless, sought to show impartially both sides of the case, and to outline the conditions to which the new method which he advocates is not applicable.

Timber. By William Bullock. Price 1s. 6d. nett. London: Sir Isaac Pitman & Sons, Limited.

This book forms one of the publisher's series of works dealing with the common commodities of commerce. Being intended for popular consumption, the author has wisely eliminated technical and scientific terms as far as possible, and confined himself to those timbers which are at the present time dealt with in ordinary commerce. He gives a very interesting account of the several varieties of timber from the time when they leave the forest to their actual use in commerce. In the concluding chapter a warning is uttered as to the necessity for tackling the problem of reafforestation, for, although actual shortage has not yet been felt, the demand continues to increase, while the sources of supply are slowly, but surely, being used up. The book is most readable and instructive.

Improved Four-figure Logarithm Table. By G. C. McLaren. Price 1s. 6d. nett. London: Cambridge University Press.

These four-figure tables are conveniently arranged on the thumb index principle, and the introduction clearly explains their use in the simplification of the processes of multiplication and division.

*Any of the publications reviewed, or referred to as received, will be forwarded by the St. Bride's Press, Limited, on receipt of published price, plus postage in the case of nett books.

WAR AND DISEASE.

THE PREVENTION OF EPIDEMICS.

In the House of Commons, on the 10th inst., the Secretary of State for Foreign Affairs was asked whether any international, precautionary, or preventive measures were being taken, or instructions issued, against the danger of plague, cholera, or other rapidly spreading disease arising from the war; and, if not, whether the most competent medical advice on the subject would be obtained and made public at the earliest possible date.

The Under-Secretary of State for Foreign Affairs (Lord Robert Cecil), who replied, stated that discussions were in progress between French and British experts as to the measures to be taken for the prevention of epidemics, and the civil population would receive ample warning and advice should any danger arise.

ASSOCIATION OF MANAGERS OF SEWAGE DISPOSAL WORKS.

ANNUAL SUMMER CONFERENCE.

The annual summer conference of the Association of Managers of Sewage Disposal Works will be held at Leeds on Saturday, July 10th, at 10.30 a.m.

Dr. H. Maclean Wilson, M.D., B.Sc., will deliver his presidential address.

Mr. Geo. A. Hart, M.Inst.C.E., will give an explanation of the works included in the main drainage and sewage disposal scheme—illustrated by cartoons.

Mr. John T. Thompson, M.Sc., will read a paper, "Seven Years' Experience with a Large Sludge Pressing Plant": discussion.

Visit to the Leeds sewage disposal works.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

President Mr. J. S. Pickering, M.Inst.C.E., Borough Surveyor and Water Engineer, Cheltenham.

ANNUAL GENERAL MEETING.

The forty-second annual general meeting of the institution will be held at the Institution of Civil Engineers, Great George-street, Westminster, on Thursday and Friday, June 24th and 25th, followed by visits on Saturday, June 26th.

[The full programme will be found in The Surveyor of June 4th.]

TOWN PLANNING.

On Thursday next, at 12 noon, an informal discussion on town planning will be held at the Institution of Civil Engineers. Mr. Raymond Unwin (town planning assistant, Local Government Board) will be present. This discussion will not be reported.

A selection of maps and plans, &c., will be exhibited in the room.

J. W. Dudley Robinson,
Secretary.

ROYAL SANITARY INSTITUTE.

YEOVIL MEETING.

At Yeovil, on July 14th, a discussion on "Water Supplies to Rural and Small Urban Areas" will be opened by Dr. W. G. Savage, county medical officer of health of Somerset.

NATIONAL ROAD CONFERENCE AND EXHIBITION, 1915.

PROGRAMME.

The following are the arrangements for the forthcoming Road Conference and Road Exhibition in London organised by the County Councils Association:

Friday, June 25th.

4 p.m.—Official opening of the exhibition at the Royal Horticultural Hall, Vincent-square, S.W., by the Right Hon. Walter Long, M.P., President of the Local Government Board.—Chairman, The Right Hon. Henry Hobhouse.

Monday, June 28th.

2.30 p.m.—Conference on "The Use of Tar, Pitch and Bitumen in the Construction and Maintenance of Roads, with special reference to the subject of Corrugations." Papers by Mr. Percy J. Sheldon, M.Inst.C.E., county surveyor, and Mr. Alfred J. Lyddon, Assoc.M.Inst.C.E., deputy county surveyor, of Essex, and by Mr. G. H. Jack, county surveyor of Herefordshire.—Chairman, The Mayor of Westminster.

Tuesday, June 29th.

2.30 p.m.—Conference on "Heavy Traffic." Papers by Mr. Harcourt E. Clare, clerk of the Lancashire County Council, and Mr. Ernest J. Elford, M.Inst.C.E., M.I.Mech.E., borough engineer and surveyor of Southend-on-Sea.—Chairman, Colonel G. Dixon.

Wednesday, June 30th.

2.30 p.m.—Conference on "The Classification of Roads." Paper by Mr. G. Montagu Harris, M.A., Barrister-at-law, secretary to the County Councils Association.—Chairman, Sir W. Ryland D. Adkins, M.P.

Thursday, July 1st.

2.30 p.m.—Conference on "The Reconstruction of Roads in Belgium, with general reference to the injury done to roads by war operations and military traffic." Paper by M. Henri Vandervin, Ingenieur en Chef Directeur des Ponts et Chaussées de Belgique.—Chairman, His Excellency the Belgian Minister.

The conferences will be held in the Lecture Room at the Horticultural Hall, on the first floor.

The exhibition will be open every day from June 25th to July 1st inclusive (with the exception of Sunday), from 10 a.m. to 7 p.m.

APPOINTMENTS VACANT.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, *but those responsible for their despatch are recommended to arrange that they shall reach* The Surveyor *office by noon on* Wednesdays *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

SANITARY INSPECTOR.—June 21st.—Corporation of Mansfield. £100—£140 per annum.—Mr. J. Harrop White, town clerk.

ROAD SURVEYOR.—June 23rd.—Denbighshire County Council. £100 per annum, with travelling expenses.—Mr. W. R. Evans, clerk, County Offices, Ruthin.

WORKS INSPECTOR.—June 25th.—Rhondda Urban District Council. £130 per annum.—Mr. E. H. Barber, engineer and surveyor, Pentre, Rhondda.

TEMPORARY ASSISTANTS.—June 28th.—Corporation of Chesterfield. £80 a year.—Mr. H. A. Bridge, acting borough surveyor.

SANITARY INSPECTOR.—June 28th.—Lewisham Borough Council. £150 a year.—Town Clerk, Town Hall, Catford, S.E.

TEMPORARY SURVEYING ASSISTANT.—July 1st.—Gelligaer Urban District Council. £120 a year.—Mr. Frank T. James, clerk, Hengoed, Glam.

TEMPORARY CLERK.—Corporation of Cheltenham.—Borough Engineer, Municipal Offices, Cheltenham.

SANITARY INSPECTOR.—Finsbury Borough Council. £3 per week.—Medical Officer of Health, Town Hall, Rosebery-avenue, London, E.C.

DRAUGHTSMAN.—Public Works Department, Government of the Gold Coast. £250—£300.—Crown Agents for the Colonies, Whitehall-gardens, London, S.W.

ASSISTANT ENGINEERS.—Public Works Department, Government of the Gold Coast. £350—£400.—Crown Agents for the Colonies, Whitehall-gardens, London, S.W.

DRAUGHTSMAN.—Survey Department of the East India Protectorate. £160—£205 a year.—Crown Agents for the Colonies, Whitehall-gardens, London, S.W.

MUNICIPAL CONTRACTS OPEN.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, *but those responsible for their despatch are recommended to arrange that they shall reach* The Surveyor *office by noon on* Wednesdays *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

Buildings.

COCKERMOUTH.—June 21st.—For rebuilding a retaining wall, for the Gas Committee.—Chairman of the Gas Committee.

GLAMORGAN.—June 21st.—For the erection of playsheds at certain schools, for the county council.—Glamorgan County Hall, Cardiff.

LEEDS.—June 21st.—For the erection of a two-story building, for the corporation.—Town Clerk.

PLYMOUTH.—June 21st.—For alterations and repairs to No. 34 Exeter-street, for the corporation.—Mr. J. Paton, borough engineer and surveyor.

ROCHDALE.—June 22nd.—For the reconstruction of a turret at the assembly hall, for the corporation.—Mr. P. W. Hathaway, Town Hall.

SHREWSBURY.—June 22nd.—For building concrete block boundary wall and forming footpath, for the corporation.—Mr. A. W. Ward, borough surveyor.

MANCHESTER.—June 23rd.—For the reconstruction of a bridge, for the corporation.—City Surveyor.

CLAREMORRIS.—June 23rd.—For the erection of cottages, for the rural district council.—Mr. M. Cosgrave, architect.

BLACKPOOL.—June 23rd.—For excavating and underpinning at the electricity works, for the corporation.—Mr. John S. Brodie, borough surveyor.

DURHAM.—June 25th.—For taking down and re-erecting two iron schools, for the Education Committee.—The Clerk, Shire Hall, Durham.

KENT.—June 25th.—For repairs to schools, for the Education Committee.—Mr. W. H. Robinson, architect, Sessions House, Maidstone.

KENT.—June 25th.—For repairs to schools, for the Education Committee.—Mr. W. Robinson, architect, Sessions House, Maidstone.

WILTS.—June 25th.—For alterations and repairs to various schools, for the Education Committee.—Mr. J. George Powell, county surveyor, Trowbridge.

BRIERFIELD.—June 26th.—For the erection of two retaining walls, for the urban district council.—Mr. B. Halstead, surveyor.

LEYTON.—June 29th.—For cleaning, painting and repairing various schools, for the Education Committee.—Mr. W. Jacques, 2 Fen-court, Fenchurch-street, E.C.

CONWAY.—June 29th—July 5th.—For the construction of steel girder bridge and approaches, and laying mains, for the Colwyn Bay Joint Water Supply Board.—Mr. C. F. Farrington, engineer, Trinity-square, Llandudno.

HOMERTON.—June 30th.—For repairs and cleaning at hospital, for the Metropolitan Asylums Board.—Mr. W. T. Hatch, engineer, The Embankment, E.C.

LONDON.—June 30th.—For repairs and cleaning works at Homerton Asylum, for the Metropolitan Asylums Board.—Board Offices, Embankment, E.C.

BOOTLE.—June 30th.—For alterations to offices and sheds at the town hall yard, for the corporation.—Borough Engineer.

GODALMING.—June 30th.—For the erection of a sanatorium, for the Metropolitan Asylums Board.

WREXHAM.—July 8th.—For redecorating and painting certain buildings, for the corporation.—Mr. J. England, borough engineer, Willow-road.

ALDERSHOT.—For the re-erection of a temporary hospital. Offers invited from owners of wood or iron buildings.—Mr. F. C. Uren, surveyor.

BOOTLE.—For alterations to school lavatories, for the corporation.—Borough Engineer.

Gas and Electricity.

EDINBURGH.—June 21st.—For the supply of two 5,000-kw. turbo-alternators and condensing plant, for the corporation.—The Engineer, Dewar-place, Edinburgh.

BIRKENHEAD.—June 30th.—For the supply of a gas condenser and gas washer, for the corporation.—Gas Engineer, Gasworks, Thomas-street.

Engineering: Iron and Steel.

MOTHERWELL.—June 21st.—For excavations in connection with laying of gas mains, for the corporation.—The Gas Engineer, Mill-road, Motherwell.

MAESTEG.—June 21st.—For the construction of a retaining wall, carriageway, footway and four-stall urinal, for the urban district council.—Mr. S. J. Harpur, engineer.

DUNDEE.—June 23rd.—For the supply of steel rails, for the Harbour Trustees.—Mr. J. H. Thompson, general manager and engineer.

RHONDDA.—June 25th.—For the supply of wrought-iron tubes and ironmongery, for the urban district council.—Mr. E. H. Barber, engineer and surveyor.

EASTBOURNE.—June 26th.—For the supply of cast-iron circulating water piping and valves, for the Electricity Committee.—Mr. J. K. Brydges, borough electrical engineer, Electricity Works.

BATTERSEA.—June 30th.—For the supply of iron castings, for the borough council.—Borough Engineer.

HALIFAX.—July 1st.—For the supply of electricity plant, for the Electricity Committee.—Mr. W. M. Rogerson, borough electrical engineer.

LLANDILOFAWR.—July 2nd.—For the construction of water supply, for the rural district council.—Mr. E. Jones, surveyor, Glancennen, Llandebie.

MADRAS.—July 14th.—For the supply of cast-iron pipes, special castings, sluice valves and hydrants, for the corporation.—Mr. J. W. Madeley, special engineer; agents, Messrs. James Mansergh & Sons, 5 Victoria-street, Westminster, London, S.W.

RANGOON.—August 11th.—For the installation of a system of fire alarms, for the municipality.—Messrs. Ogilvy, Gillanders & Co., 67 Cornhill, London, E.C.

Roads.

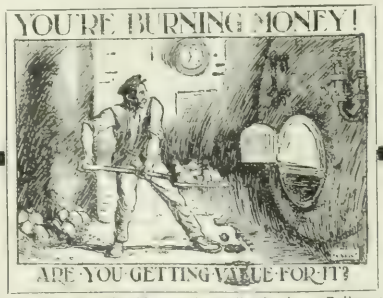
HALIFAX.—June 19th.—For private improvement works, for the corporation.—Mr. J. Lord, borough engineer.

REIGATE.—June 19th.—For repairing tar-macadam road and resurfacing with Trinidad Lake asphalt or similar material, Hatchlands-road, for the corporation. Borough Surveyor.

STEVENAGE.—June 21st.—For the supply of 800 tons clean chippings and dust, and broken Guernsey, Leicester, or other granite, for the urban district council.—The Surveyor.

GUILDFORD.—June 22nd.—For the construction of a road, for the rural district council.—Mr. J. Anstee, engineer, Commercial-road.

BROWNHILLS.—June 28th.—For tar-spraying 35,000 super. yds. of road and tar grouting, for the urban district council.—Mr. J. H. Shaw, engineer and surveyor.



The above question should appeal to all who have Boilers under their control, particularly at the present time. The only way of knowing what you are getting in return for the money spent on coal is to continuously measure the Feed Water. The LEA RECORDER is specially suitable for this purpose. It would help you to save coal.

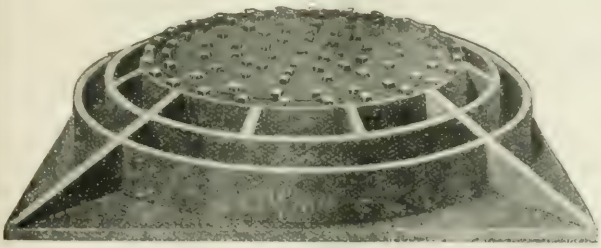
THE "GRIP" PATENT MANHOLE COVER.

Rounded edges avoided. A depth of 5in. of macadam gripped around the outer frame of the cover by the concentric rings shown.



SEWERAGE IRONWORK.

AS will be seen from the photograph, the concentric rings which form an integral part of the frame provide annular spaces in which the road material is not only held up, but becomes more and more consolidated in these spaces as it is compressed by the traffic. This has the effect of reducing the crumbling of the road material, and its wearing away from the vertical edge of the frame.

But road material will wear away eventually, and when it does the "GRIP" cover provides against the danger of abrupt edges. The concentric rings are graded in height, and if the road above them becomes worn they provide an inclined plane to the edge of the frame. It will be seen that we have avoided rounded edges, because with a curved edge the road material becomes so thin at its point of contact with the iron that it can only last for a very short time, and when it has worn a depression is left between the road surface and the iron, which is dangerous.

NATIONAL ROAD CONFERENCE & EXHIBITION (1915)

ROYAL HORTICULTURAL HALL, London, S.W.
June 25th to July 1st, 1915.

THE FIRST NATIONAL EXHIBITION of road material, plant and machinery organised by the County Councils Association, with the assistance of representatives of the Road Board, the Institution of Municipal and County Engineers and the County Surveyors' Society. To promote the construction and maintenance of good roads for modern traffic.

The Right Hon. WALTER LONG, M.P., President of the Local Government Board will open the Exhibition.

The Belgian Minister, Monsieur PAUL HYAMS, will preside at the Conference on the Reconstruction of Roads in Belgium.

Applications for space, plans, &c., should be addressed to:—

A. F. MAY,
Business Manager.

13 Victoria Street,
London, S.W.

BASINGSTOKE.—June 30th.—For steam rolling, for the rural district council.—Mr. R. Forrester, surveyor, Chequers-road.

HALE.—July 7th.—For making up back passages, for the urban district council.—Mr. T. Blagburn, surveyor.

Sanitary.

TATTERSHALL.—June 21st.—For the construction of a sewer, manhole, gully, and settling tank, for the rural district council.—Council Office, 4 Church-lane, Horncastle.

BLYTH.—June 21st.—For scavenging the village of Carlton, for the rural district council.—Mr. A. E. Hewett, 78 Highland grove, Worksop.

BLEAN.—June 21st.—For the construction of stoneware pipe sewers and manholes, for the rural district council.—Mr. F. A. Ward, engineer, "Roseneath," Eddington, near Herne Bay.

SHEFFIELD.—June 23rd.—For the removal of house refuse and emptying closets, for the rural district council.—Mr. J. Stones, surveyor and inspector.

SAWBRIDGEWORTH.—June 24th.—For house scavenging, for the urban district council.—Mr. W. Morris, clerk.

CROYDON.—June 24th.—For the removal of house refuse, for the urban district council.—Mr. E. J. Gowen, clerk, Katherine-street, Croydon.

BROWNHILLS.—June 28th.—For laying 9-in. stoneware pipe sewer, for the urban district council.—Mr. J. H. Shaw, engineer and surveyor.

NEWPORT (I.W.).—July 5th.—For the removal of house and road refuse, for the corporation.—Mr. T. Ross Pratt, town clerk.

GRANTHAM.—For the construction of a surface-water sewer, for the corporation.—Borough Surveyor.

Stores.

INVERNESS.—June 21st.—For the supply of ironmongery, brasswork goods, lead pipes, special castings, cast and wrought ironwork, and the excavation and laying of gas mains, for the Gas Commissioners.—The Manager, Gasworks.

TENDERS FOR MUNICIPAL WORKS OR SUPPLIES.

The Editor invites the co-operation of SURVEYOR readers with a view to making the information given under this head as complete and accurate as possible.

* Accepted. † Recommended for acceptance.
‡ Provisionally accepted.

CANNOCK. Accepted for the construction of conveniences, for the urban district council.—Mr. R. Blanchard, engineer:

Hacksley Brothers, Wellingborough, £354.

DARLINGTON. For the supply and laying of cast-iron condenser water pipes, for the corporation. The Borough Electrical Engineer:

Cochrane & Co., Middlesbrough.

ISLE OF WIGHT. Accepted for repairs and other work to a bridge, for the rural district council.—Mr. L. A. Cozens, surveyor.

Rousell & Son, Ventnor, Isle of Wight, £595

LAMBETH. For the execution of work in connection with the painting and cleaning of the infirmary, for the Board of Guardians:

Minutes of Proceedings.

Municipal Engineering War-time Appointments.

In our last issue (p. 762) we noted that the Local Government Board had expressed their view that when vacancies for municipal engineering officers occur, and it is unlikely that candidates suitable for permanent appointment who are not eligible for the Army or for special work in connection with the war can be obtained, the local authority should consider first whether it would be possible by a rearrangement of duties among other officers to avoid any fresh appointment during the period of the war; and that if this should be found impracticable they should endeavour to secure the services of any retired officer with the requisite experience who might be able and willing to act during that period. We have before us a letter from one of the ablest of our retired civic engineers, who is quite willing to offer his services for the duration of the war, but, he adds, "As I cannot very well advertise my willingness . . . what can I do?" In the hope that we may be of some service in bringing together retired engineers and the local authorities who need their help, we are opening a register of men similarly desirous of assisting local authorities temporarily, and we ask such as are qualified to send us their names and the names of the districts they last served. At the same time local authorities who wish to avail themselves of assistance as suggested by the Local Government Board are asked to make their requirements known to the Editor of "The Surveyor," Bride-lane, Fleet-street, London. The names of those who offer their services will not be published in our columns, but the list will be sent direct to local authorities who have vacancies to fill.

* * *

The Incorporated Municipal Electrical Association.

At the annual convention of this body, which was held on Thursday and Friday last in London, an interesting report on the practical working of the "Point Five Tariff" was presented by Messrs. A. S. Blackman and Thos. Roles, the chief electrical engineers of Sunderland and Bradford respectively. It may be explained that the quaintly named tariff in question consists in a charge of 0·5d. per Board of Trade unit, usually but not always combined with a fixed annual or quarterly charge based upon the rateable value of the house or upon the amount of electrical apparatus installed, and the tariff applies only to private residents. Both of the authors employ the rateable value of the house as the basis for the fixed charge, but they use [illegible] reports received from users of alternative methods. They agree in enthusiastically recommending the system as a most valuable aid to their undertakings, and show that it is welcomed by consumers, the number of whom in each town has greatly increased since its introduction. One of its most useful features is the fact that it enables a consumer to estimate very closely what his bill for electricity will be, and it is readily understood—which is not the case with the maximum-demand system. Another advantage is that, as all units are charged for at the same rate, no matter what they are used for, there is no need for installing a separate meter and wiring for the adoption of electric heating and cooking at a lower price than lighting. Again, as additional units make very little difference to the total charge, the consumer has every inducement to employ electricity for heating and cooking, and to increase his lighting installation, with beneficial results to the supply station, which also gains the advantage of an improved load factor. The majority of new consumers adopt the point five tariff, and most of the older ones have changed over to it; and contractors regard it with emphatic approval as a valuable aid to business.

A report on the use of electric vehicles in municipal service — some extracts of which appeared in our last issue—was submitted by Mr. F. Ayton (Ipswich), honorary secretary of the Electric Vehicle Committee, and contains information of much value to surveyors and borough engineers. The vehicles referred to are driven by storage batteries, and are noteworthy for the simplicity of their mechanism and the ease with which they can be handled by anyone with very little training. But their chief recommendation is the economy of working which is claimed for them as compared with either horses or petrol-driven vehicles, while they are reported to have proved most reliable in service and inexpensive to maintain. Glasgow Corporation Electric Supply Department, for instance, found that their first electric van did the work of two horses at less cost, and compared with a petrol van previously used by the department showed a saving of no less than £240 per annum, and three more electric vehicles have now been ordered. A well-known London stores employs fifty-five electric delivery vans because they are cheaper

than horses. Seventeen municipalities in this country are using or are about to use electric vehicles. Large numbers are employed in Continental cities for collecting house refuse—the municipality of Paris possesses no fewer than 100 for this purpose. For ambulance work the electric vehicle is ideal; several London authorities use electric ambulances, and a number of English fire brigades have adopted battery vehicles of various types. Electric battery omnibuses are also employed by several British municipalities in conjunction with their tramways.

The annual convention of the association should have been held this year at Dundee, but the president, Major H. Richardson, city electrical engineer, was called to the Colours, and it was decided to hold only the necessary annual meeting in London, with Mr. A. C. Cramb (Croydon) as acting president, and the usual social functions were abandoned. Under the circumstances there was a moderate attendance, and the business was confined to the report of the council and similar matters. The report of the council shows that a great deal of useful work has been accomplished during the past year in connection with a variety of important questions. The subject of standardisation has received especial attention, and the association has cordially co-operated with other bodies in this matter. The Development Committee and the Electric Vehicle Committee have been very active, and it is clear that the association is vigorously promoting the development of the supply and utilisation of electricity in this country.

Water Supplies from the Chalk.

Probably the chief source of the water supply of this country is the chalk, and the value of all fresh evidence in relation to water derived from that formation is sufficiently apparent. Special interest therefore attaches to the two excellent papers which were read before the Institution of Water Engineers on Friday last, and which deal respectively with "The Effect of Springs upon Water Levels in the Chalk of East Surrey," and with the "Hydro-geological Conditions at Newbald, East Yorkshire"—*i.e.*, at the escarpment of the chalk forming the East Yorkshire Wolds. In both cases the flow of water in the chalk is discussed, and although the conditions dealt with by each author are entirely different, the remarks in each case tend to show the importance of springs in relation to the flow and level of water in the chalk. Mr. Henry Dewey, the author of the paper dealing with East Surrey, shows very clearly that the dip and character of the beds of chalk in the district dealt with do not appreciably affect the water level, but that the exhaustion of the water caused by the many powerful springs at Ewell, Carshalton, and Waddon tends to lower the water level permanently on one side of the district. There are here two contiguous areas in which the movements of the subterranean waters differ in a marked manner. This is evidently due to the emission of springs in the one area and to their absence in the other. It is generally accepted that water follows the line of least resistance, and, flowing through the fissures in the chalk, that the effect of a spring or of excessive pumping causes a depression in the water level at the point where the water is exhausted, and that the water gradient ascends from that point. The investigations of Mr. Dewey and a map which he has prepared showing the water levels in East Surrey will be duly appreciated by the water engineer.

Mr. Percy Griffith, the author of the paper dealing with East Yorkshire, shows very clearly the manner in which a water supply problem of considerable difficulty should be dealt with, and it is greatly to be desired that the paper should be read by members of boards and authorities who are responsible for water undertakings, for they would then grasp the importance and value of work being dealt with in a scientific manner, and would understand more clearly than is sometimes the case the need for sufficient experimental work and preliminary investigation before spending money upon some large undertaking which may later prove to be a failure. Mr. Griffith first proved that the most obvious source of supply and a gravitation scheme would be more expensive than a pumping scheme, and that by raising the water 100 ft. the cost of the mains would be so reduced as to more than cover the cost of the pumping. A trial boring made in the chalk, and a trial well and headings, proved that the expected flow of water in the chalk was insufficient. It was then observed that, owing to the erosion of an impervious stratum overlying the oolitic limestone, the natural drainage of the local chalk area was passing freely into the fissured limestone, and that the water held in this limestone formation burst up where the overlying impervious layer was too thin to stand pressure, and thus formed springs. It was thus argued that a boring carried into the limestone would tap a larger supply. The boring was then made, and has proved to be absolutely successful. The manner in which this supply was obtained reflects the greatest credit on the diligence and ability of the engineer. The source of the water was undoubtedly the chalk. The chalk was its gathering ground, and yet a well in the chalk could not gather it, clearly because it was escaping by means of a subterranean outlet into the limestone. Feeling certain that the water must be there, the engineer had the courage of his convictions, and, by careful rearranging and sufficient experimental work, was enabled to find it. The two papers are dealt with elsewhere in these pages, and will form a most valuable addition to the published records of the Institution of Water Engineers.

* * *

Co-operation in Town Planning.

Success in the inauguration and execution of a town planning scheme depends so much upon a good understanding between the local authority and the landowners that the Local Government Board have from the first insisted upon the importance of conferences for the free discussion of points of conflicting interest. At these conferences both local authority and landowner are usually represented by their surveyors, and the successful development of a scheme will depend to a very great extent upon the establishment of a spirit of mutual concession and co-operation, the surveyors respectively acting for the public authority and representing the private interest. Some of the means by which this desirable result may be attained are suggested in the circular on the subject recently issued by the councils of the Surveyors' Institution and the Institution of Municipal and County Engineers, and reproduced in our last issue. In that circular it is specially pointed out that it is of the utmost importance to reconcile the various interests affected, and that this can most effectively be done by conferences being held between the officers of the local authorities on the one hand and the advisers of land and property owners on the other, both in the earliest and in subsequent stages of the preparation of a scheme, so that, as far as possible, there may be agreement on the main principles before the final Local Government Board inquiry takes place. To this end, and in order to facilitate the interchange of opinion and information, the councils of the two institutions have arranged that, if the officers of local authorities will notify the secretary of the Institution

of Municipal and County Engineers when they are about to prepare schemes, he will supply the secretary of the Surveyors' Institution with the necessary information for communicating to members of that body likely to be concerned, so that such engineering matters may get into touch with each other.

* * *

The Annual Meeting.

The earlier part of the excellent address delivered yesterday by Mr. H. T. Wakelam, the county engineer of Middlesex, on the occasion of his installation as president of the Institution of Municipal and County Engineers, contained some observations on the relation between theory and practice in the education of an engineer which are well worthy of attention. The measure of a man's theoretical knowledge may be proved by his examination successes, but practical experience can only be obtained in the workshop and on works of construction. It follows that it should be the aim of those who conduct engineering examinations to make them as practical in character as possible, and this, in our view, is at once the justification for and the peculiar merit of the examinations which the institution holds from time to time. Continuing to address the junior members, the new president urged them to organise themselves by districts for the purpose of arranging visits to works in progress. In dealing with some of the more important matters which are comprised in the ordinary work of the municipal engineer, Mr. Wakelam pointed out that since the passing of the Public Health Act, 1875, a sum of more than £100,000,000 sterling has been expended in connection with the disposal of sewage and works of water supply in England and Wales alone. The justification for this enormous expenditure is to be found in the great reduction which has taken place in the death-rate, to say nothing of the improvement in the conditions in which the poorer members of the community live. These remarks naturally led to a reference to the housing question and the problem of the economic rent in rural districts. Mr. Herbert Samuel, the late President of the Local Government Board, took the view that, even if the agricultural labourer cannot afford to pay an economic rent for a newly erected cottage, there are others in every village —such as policemen, postmen, railwaymen and others—who can, and that if new cottages are built for this class of tenant the cheaper buildings in which they now reside will become available for their poorer neighbours. In Mr. Wakelam's opinion, with which we fully agree, this suggestion should receive the most careful consideration at the hands of local authorities and their advisers.

In present circumstances it was only natural that a large part of the address should have been devoted to the subject of roads, and in particular to the problems presented by the advent of the motor car. In this connection the members were reminded that the Government decided a short time ago to appoint two committees—one to consider the technical aspect of the question of damage to roads by motor vehicles, and the other to consider the wider question as to the proper payment, if any, to be made by their owners towards the upkeep of the roads they use. We have frequently had occasion to express our views on both of these questions, and we need therefore say no more at the present moment than that we agree that road authorities have no desire to throttle trade in any way, and that their only legitimate interest is to secure a settlement which shall be fair and equitable as between the road user on the one hand and the ratepayer on the other. A most interesting part of the address was that in which the president dealt with the economic aspect of road work. In view of the fact that every single additional penny expended per square yard per annum on the maintenance of the roads of England and Wales, added to the roads bill, means an additional million of money to be annually found by the ratepayer, the point of "cost *v* life" of road materials will be seen to be the most important monetary factor to be considered in connection with local government. A reference to the close connection which exists between arterial roads and town planning concluded an address which was a worthy inauguration of what it is confidently anticipated will be a successful year of office.

* * *

The Orphan Fund.

As has been usual for some years now, the annual meeting of the institution was made the occasion of a gathering of subscribers to the Orphan Fund. This fund, which is deserving of much wider support than has been accorded to it hitherto, owes an incalculable debt to Mr. O. Claude Robson, who has acted as its honorary secretary and treasurer from the first. The report of the past year's work is satisfactory inasmuch as it shows that the income has not been adversely affected to any great extent by the abnormal conditions that have prevailed. On the other hand, the number of subscribers (210) is lamentably small compared with the number of members of the institution. This state of affairs will not be remedied until the general body of members realise that in a work of this kind an income derived from a wide constituency of small subscribers is of much greater value—and represents a larger amount of sympathy —than the same income received from a few large subscriptions. During the year twenty-two children have received grants, and wise administration has led to the maintenance of financial soundness. It gives us great pleasure once again to have an opportunity of commending the fund to the sympathetic consideration of our readers, and of congratulating Mr. Robson and the committee on the continued success of their charitable efforts.

* * *

Land Values and Road Widenings.

A difficulty has arisen between the Norfolk County Council and Sir Samuel Hoare with regard to the terms upon which a strip of land shall be given up for the purpose of widening a road known as Sidestrand road. The land in question is purely agricultural in character, and the portion required is some 500 yds. in length and of a width varying from 8ft. to 10ft. It appears from a report of the Eastern Highways Committee, which appears in the *Eastern Daily Press*, that Sir Samuel Hoare had been asked to give up the land on the same terms as had been accepted by other landowners in the neighbourhood, namely, that the new frontage should be fenced and made good at the public expense. In reply to this suggestion, Sir Samuel Hoare has written a letter in which he says that he has definitely decided that, when land is assessed and taxed at a certain value by one public body (the Inland Revenue), he is not prepared to give it away for nothing to another public body (the county council). We are not concerned with the local dispute, except in so far as it raises a question of principle. In our view the value put upon land for the purposes of Imperial taxation is not necessarily the measure of compensation to which the owner is entitled when it is required for a public improvement of this character. One obvious distinction is that the widening of a road usually enhances the value of the land fronting on the more commodious highway, and for that reason is often undertaken at the request of a landowner who is desirous of developing his estate. Sir Samuel Hoare is by no means the first landowner to put forward the argument implied in his letter, but we are bound to say that we cannot see that such a contention is well founded.

Hydro-Geological Conditions at Newbald, East Yorkshire.*

By PERCY GRIFFITH, M.Inst.C.E., F.G.S., &c.

The purpose of this memoir is to explain the somewhat peculiar geological conditions of the district around Newbald—that is, at the escarpment of the chalk forming the East Yorkshire Wolds—so far as they affect the question of water supply.

The investigations herein described were carried out for the purpose of obtaining a suitable source for the water supply of the rural district of Howden, and some particulars of the requirements to be provided for are therefore given.

This district comprises an area of about 150 square miles of flat agricultural land lying on the north side of the rivers Ouse and Humber, immediately opposite the mouth of the river Trent. The whole area is but sparsely populated, the only town included in the district being Howden, with a population of 2,000. The remaining inhabitants (numbering about 10,000) are distributed among widely scattered villages, the chief industry being agriculture. A large part of the area is intersected by "warping drains," and, being periodically flooded with tidal water from the rivers Ouse, Derwent and Humber, is extremely fertile. On the other hand, the natural supply of water suitable for potable and "domestic" use is very scanty, and for many years past the question of providing a general public water supply has been the subject of serious consideration.

Appointed at the end of the year 1911 to advise the council upon the question, the author has since been engaged in preliminary investigations and reports and in carrying out experimental works, and in March of the present year (1915) was able to prove by exhaustive tests the existence of an ample supply of excellent water at a point about 1 mile south of the village of North Newbald.

The great bulk of the rural district is composed of low-lying marshy land, but at the extreme eastern boundary the limits extend (for a distance of 1½ miles, measured from north to south) 2 miles eastwards of the low-lying land, and this extension brings under the control of the Howden Council an area of 3 square miles of the chalk "wolds," immediately adjacent to which are two large springs (known as "Drewton" and "Weedley" springs), which form the source of a stream known as "Drewton Beck."

. The fact that such an excellent supply of water existed on the border of the council's area did not, however, go far towards making the supply available for the general use of the inhabitants; indeed, the very earliest steps taken towards this end brought to light difficulties which proved practically insurmountable. The Drewton Beck, although not more than 10 miles in length, traverses land divided among a large number of different owners, besides affording a convenient (if not very safe) source of supply to the inhabitants of a village known as North Cave, through which it passed. Enquiries of a preliminary character showed that the use of the spring forming the source of this stream for a public waterworks would be strenuously opposed by the riparian owners and others, and that to secure the necessary authority to do this the Howden Council would have to secure a special Act of Parliament. A Provisional Order of the Local Government Board, under the Public Health Act, 1875, would have sufficed for the compulsory purchase of land, but not for the purchase of water rights. At this juncture it was realised that a rural district council has no statutory authority to promote private Bills, and that, in the event of such a Bill failing to pass into law, the members of the council would be liable to be surcharged with the expenditure incurred, subject only to the discretion of the Local Government Board to remit the surcharge if they thought fit. As in any event the cost of the scheme must involve the council in very heavy outlay, upon which the water rates alone would be quite inadequate to meet the interest and redemption charges, it will be readily understood that the council refused to face the additional risk of being made personally responsible for Parliamentary expenses. It will also be seen how keenly the Howden Council were interested in the Public Health Act, 1875, Amendment (Acquisition of Water) Bill, promoted by the Local Government Board in the year 1913, but withdrawn for want of time. This Bill (which seems to the author a very desirable measure in the public interest) would have enabled rural district councils compulsorily to purchase water rights by Provisional Order, and would therefore have overcome the difficulty in which the Howden Council were at this juncture placed.

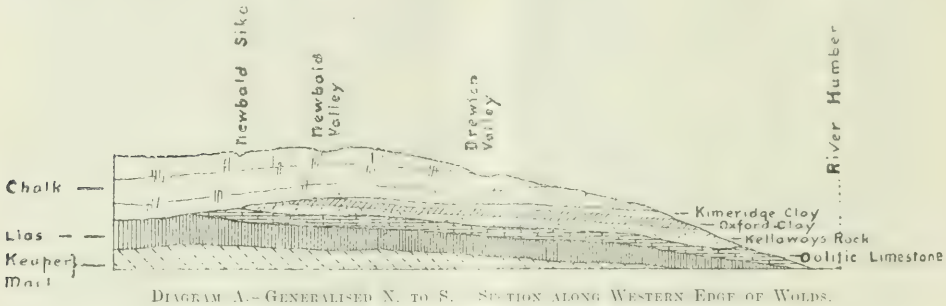

Diagram A.—Generalised N. to S. Section along Western Edge of Wolds.

Reproduced and enlarged from Geological (Water Supply) Memoir.

Further procedure in this direction being impossible, the author considered other possible sources, in the first place with a view of intercepting the water overflowing at the Drewton and Weedley springs at some point underground where the riparian owners would have had no claim for protection. It must here be explained that the clay underlying the chalk, which forms the overflow for the chalk water, outcrops at a fairly constant level of 175 above ordnance datum, and that consequently, if a sufficient supply could be tapped at any point along this outcrop, it would flow to the inhabited part of the Howden district by gravitation. The idea of collecting a supply by means of adits driven into the hillside was considered, but abandoned on the ground that the outlay on purely experimental work would have been at least £4,000 or £5,000, and that it was, indeed, impossible to estimate the actual expenditure necessary to secure the full quantity required (167,000 gallons per day).

The county council had established a weir-gauge on the Drewton Beck in the year 1902, and readings of the daily flow of the stream were available from that date up to August, 1907, when the gauge had been abandoned. These readings showed that the flow was very variable (as was to be expected in the case of a stream with an "overflow spring" as the source), and that the minimum flow approached dangerously near to the quantity required for the supply of the district. At this stage the author, in making calculations as to the diameter of the mains which

* Paper read at the Summer Meeting of the Institution of Water Engineers on Friday last.

would be necessary under various heads, found that, owing to the great distance between the source of supply and the various villages to be supplied, the raising of the water to an extra height of 100 ft.—viz., 275 ft. above ordnance datum—would so reduce the cost of the mains as to more than cover the cost of pumping the water.

As this alternative opened out a much larger area in which a suitable source could be sought for, and admitted the possibility of obtaining the water from underground by means of a well or boring, the author carefully examined the area north and south of the Drewton and Weedley springs with such an alternative in his mind. In this way he was led to devote his attention to the neighbourhood of Newbald, situated about 2 miles north of these springs.

The village of Newbald, except that it is outside the Howden rural district, is situated topographically in a position very similar to that in which the Drewton and Weedley springs appear at the surface, that is to say, at the mouth of a deeply indented valley cut into the chalk wolds, and radiating into several smaller branch valleys. These valleys are all conspicuous for the absence of visible streams, although all have been obviously formed by flowing water. At a point east of the village, where the denudation of the chalk has thrown the outcrop of the underlying clay about ¼ mile east of the normal line, are powerful springs draining the chalk, which form a stream known as Newbald Beck. This stream, after passing west and south-west through the village, turns south for about 1 mile, then south-west through another village (within the Howden district), and thence southwards until it joins the Drewton Beck referred to above.

About 200 yds. below the point where the stream turns to the south . . . it is joined by a small tributary which rises at a spring situated in another valley, similar to the main valley, but which curves sharply to the south-east about ¼ mile east of the church. This valley is very deeply cut into the chalk wolds, and extends for a distance of 1 mile from the point where it bends to the south-east. It is entirely free from dwelling-houses, and calculations from rainfall records showed that the drainage of this valley should provide an ample supply for the Howden district. The stream formed by the spring at the mouth of this valley also showed an ample discharge when first measured, and the author felt every confidence in making a trial boring on the centre-line of this valley at such a distance from the spring as to preclude any risk of claims from riparian owners. This boring, however, beyond, showing the saturation level in the chalk, the thickness of the chalk, and the existence of a well-defined band of "red chalk" at its base, proved a complete failure as regards yield of water.

The next step taken was to sink a well to the base of the chalk at a point ½ mile further down the valley, and from this headings were driven across the centre-line of the valley with a view to intercepting the underground stream which was assumed to be draining the valley towards the spring. A supply amounting to about 4,000 gallons per hour was obtained by this means, but as this was inadequate and likely to decrease after continuous pumping, it was necessary to consider whether a sufficient supply could be obtained from any one point on the chalk outcrop.

The failure of this well, sunk on the centre-line of a deeply cut chalk valley, proved beyond possibility of doubt that, contrary to generally accepted theory, and experience in other chalk areas, the underground drainage or stream lines did not in this case follow the surface configuration. Calculations based upon the minimum rainfall of the district showed that, had this been the case, an ample supply would have been obtained at this site. Before abandoning it, however, the author had a boring driven from the bottom of the well to ascertain the sequence of strata underlying the chalk. The data so obtained proved very interesting and useful, but unfortunately the yield of water was not materially increased, and for financial reasons the author could not advise the council to continue the experimental work at this site, either in proving the direction of flow of the underground chalk-water, or in seeking another source of supply below the chalk. It was afterwards proved that if this boring had been continued for a further 10 ft. it would have reached the oolitic limestone, and possibly tapped a sufficient supply of water therein, but no evidence of this was available at the moment, and the results since obtained elsewhere have entirely justified the decision arrived at.

In the course of his investigations on the banks of the Newbald Beck, the author had observed some very strong springs flowing into it at a point situated about half-way along the stretch which travelled southwards. These proved on examination to have been piped with earthenware drains (in the form of an inverted U laid on flat tiles), extending for a distance of 140 yds. across a field to a point just below and on the west of the road leading southwards from the village. Excavations at this point revealed three springs at a depth of about 3 ft. below the surface, and a trial boring immediately to the east of the springs revealed further that the water rose through vertical fissures from a depth of 12 ft. below the surface where the oolitic limestone was touched.

The ordnance geological map showed that this limestone outcropped only on the west of the beck, and personal observation proved that the limestone on the west of the beck drained directly into the stream, so that the water flowing in these springs could not possibly be the natural drainage of the limestone. The problem as to the real source of this large flow (rough measurements showed it to amount to about 400,000 gallons per day from the three springs, or nearly one-half of the flow of the beck at this date) became therefore extremely interesting. A further study of the geological maps, sections and memoirs revealed the fact that the beds between the chalk and the limestone were arched on a north to south plane, and that at a point about 1 mile north of the village (marked on the map as "Newbald Sike"), the clays separating the chalk from the limestone disappeared (see Diagram A). At this point a characteristic chalk valley extends eastwards into the wolds, very similar to those at Drewton and Newbald, but distinguished by an entire absence of any springs or stream, and it then became evident that at the base of this valley erosion had removed the clay and impervious band of "red chalk" separating the two water-bearing strata, and thus enabled the natural drainage of the local chalk area to pass into the freely fissured limestone, and, following the dip, to pass southwards until, at a point where the erosion caused by the Newbald Beck or its earlier prototype had rendered the overlying beds (consisting chiefly of chalk, gravel and glacial drift) insufficient to resist the upward pressure due to the head, the water had burst open an outlet for itself, whence it flowed into the beck, as above described.

A small trial boring was then driven at a point 200 yds. to the east of the oolite springs, above described, and the strata proving approximately what was expected, and the water level closely corresponding with that of the water at the springs, a contract was entered into for a 12-in. boring to be driven into the oolitic limestone, and for test pumping therefrom. This boring was carried out on a site adjacent to the small trial boring, but below the outcrop of the Oxford clay, and where the conditions were otherwise more favourable for the construction of permanent works, and was so successful that three weeks' continuous pumping at a rate of 10,000 gallons per hour made no impression whatever on the water level.

On analysing the water, however, signs of pollution were found, and a period of three months was occupied in tracing and removing the cause of this pollution and in again testing the 12-in. boring. The final test proved perfectly satisfactory, and the scheme will be proceeded with as soon as the war is over and financial conditions become more nearly normal.

The work involved in detecting and preventing the pollution of the limestone-water has no particular geological interest except in so far as it revealed the existence of a communication between the "Kellaways Rock" (mainly represented by a fine compact bed of grey sand about 22 ft. thick, yielding a supply of locally polluted water) and the oolitic limestone. This communication had no doubt been established by three local wells sunk in the "Kellaways Rock," where borings had been driven into the limestone without sealing the bottoms of the wells. In each case a concrete bottom was inserted at the bottom of the well, ater which the water in the well rose to a higher level, being that at which the "Kellaways" water had been found in the council's 12-in. boring. This water being thus shut off from the limestone, the water from the limestone proved to be as satisfactory in regard to quality as it was in regard to quantity.

It may be here mentioned, as a matter of more general interest, that the water in the "Kellaways Rock" finds an outlet at various points in and near the village. There are therefore three separate water supplies in this area, which, except that all are derived from the chalk in the first instance,

are entirely distinct one from the other until they meet in the Newbald Beck -viz., (1) the direct overflow from the local chalk springs; (2) chalk-water flowing through the local "Kellaways" beds; and (3) the chalk-water which enters the oolitic limestone to the north of the village and discharges at the springs, to which reference has been made above.

Other features of the works, including analyses of the water, will be given, if opportunity offers, when the works have been carried out, but the author has preferred to limit the present paper to the experimental works and the hydro-geological data obtained therefrom.

FIRE TESTS WITH FIRE EXTINGUISHERS.

[We have received from the Pyrene Company, Limited, the following comment on the report of the British Fire Prevention Committee's recent tests, and we give it verbatim in accordance with our usual audi alteram partem principle. The précis we published did, in fact, differ materially from the actual report itself, and we regret that our attention was not drawn to this when we received the précis.]

Dear Sir,—Referring to notice appearing in your issue of June 11th in regard to tests conducted by the British Fire Prevention Committee of the Pyrene fire extinguisher, we take exception to the second paragraph, in which you state:—

> "The testers notified the committee that their appliance was not suitable for the ordinary fire tests with loose, inflammable materials, as required under the committee's standard for ordinary extinguishers."

We never made any such statement to the British Fire Prevention Committee.

The third and fourth paragraphs of your notice, which state:—

> "The tests that were undertaken were the easier part of the committee's series of petrol tests, &c.," are true in part, but very misleading, as no mention is made of the fact that, at our suggestion, a large number of very practical and difficult supplementary tests were accepted by the committee and undertaken by us.

In paragraph five you state:—

> "In other words, this appliance is primarily useful for small spirit fires, as met with in motor-car work, &c., but is in no way applicable to ordinary fires."

This statement is untrue, in that we claim—and it has been proven by a large number of cases in private houses, as well as factories, stores, &c.—that Pyrene *is* effective on ordinary fires, if used while such fires are in an incipient state.

Such an instance as is shown by the attached testimonial, which has just come to hand, is typical of the real value of Pyrene on an ordinary fire, such as would be apt to occur in a private residence. Such firms as Vickers, Limited, have had a considerable number of experiences with Pyrene, as a result of which our machines are extensively installed throughout their various works.

The British War Office and Admiralty have purchased over 30,000 extinguishers in the last eighteen months, our sales to them having increased practically each month over preceding months. We have orders from these two Government Departments during the present month for over 10,000 extinguishers. We believe that the Government would hardly purchase in such large quantities if Pyrene had not amply justified the faith they have put in it, and we have a very large number of instances on record where fires have occurred on Government property and been successfully extinguished with Pyrene. These include motor car, petrol, and general stores, ammunition trains, as well as ordinary fires in buildings. Such instances as these are better proof of its efficacy on ordinary fires than any number of tests under artificial conditions.

The last point we take exception to is the statement in regard to hydrochloric acid. No comment regarding this is made in any way whatsoever in the British Fire Prevention Committee's report.

You may be interested to know that all submarines in the British Navy are fully equipped with Pyrene, and from this it is quite evident that the authorities at the Admiralty are convinced that its use is not dangerous to the crews.

Pyrene extinguishers are known and approved by underwriters' laboratories in the United States, and our appliance is awarded equal recognition with soda and acid extinguishers on practically all ordinary risks, and we are given preference on special risks, such as paint and chemical factories, petrol stores, &c.

An interesting fact is that English insurance companies operating in America of course recognise Pyrene on all such risks in that country.—Yours faithfully,

Pyrene Company, Limited.

19-21 Great Queen-street,
London, E.C.
June 22, 1915.

[copy of testimonial referred to.]

I have much pleasure in testifying to the wonderful effects of the Pyrene fire extinguisher, which was undoubtedly the means of saving my house from being burnt down.

Last Sunday, June 13th, our middle-floor back room was ignited by the fire of a match, and the room was soon in flames, and although several buckets of water were used, they only seemed to aggravate the condition, as the heat had melted the gas pipe, and a strong jet of gas escaping from this pipe had ignited, and all the furniture in that part of the room, including a piano, sewing machine, pile of music, chair and table was well alight.

Luckily, we thought of the Pyrene extinguisher, which had been sent on approval from Whiteley's the day before; but by this time the heat and smoke were so intense that I could not enter the room to use the extinguisher, but had to stand in the doorway and squirt the liquid from there.

Despite the fact that I had never handled the extinguisher before, it was only a question of a few moments' squirting and the fire was instantly arrested and put out as if by magic. All those who were present and saw the wonderful effect were astounded.

The apparatus being so simple to work, no time is wasted, and the quantity of fluid required to extinguish flames is so little that it makes a most economical instrument to use. I shall certainly recommend it to all I know.

(Signed) O—— W —— R——.

SOME RECENT PUBLICATIONS.*

Guide to the Reports of the Royal Commission on Sewage Disposal. By G. Bertram Kershaw, M.Inst.C.E., M.Am.Soc.C.E., F.R.San.I., F.G.S. Price 5s. nett. London: P. S. King & Son, Limited.

Engineers, surveyors, medical officers of health, chemists and bacteriologists frequently have occasion to refer to the voluminous reports and appendices presented by the Royal Commission on Sewage Disposal, and in most cases there is difficulty in finding quickly the volume and the page on which the information required is printed. As the total number of documents amounts to some thirty volumes, it is obvious that a guide to their contents is indispensable, and this is now available in the present volume. All the headings and sub-headings have been extracted, and set out seriatim for each report, so that the subject matter is thus given in a condensed form with the pages of the document on which each item appears. With the aid of the separate indices of subject matter, names and places, it should be possible for anyone to find any information at a moment's notice, and no bookshelf containing the Royal Commission's reports can be considered complete without a copy of Mr. Kershaw's valuable guide.

Timber Fireproofing.—The directors of the London and North-Western Railway have decided, after full investigation and exhaustive trial, to instal a plant at their Wolverton works for the purpose of rendering wood fireproof by the "Oxylene" process. The wood so fireproofed is to be used in the construction of their railway carriages, wagons, &c., and the plant to be installed will be capable of dealing with 150,000 cub. ft. of wood per annum. The "Oxylene" process has been adopted for general building construction by Messrs. Cadbury Bros., Limited, Wm. Cooper & Nephews, and other well-known firms.

Institution of Municipal and County Engineers.

ANNUAL GENERAL MEETING IN LONDON.

The forty-second annual general meeting of the Institution of Municipal and County Engineers opened yesterday morning at the Institution of Civil Engineers, Great George-street, Westminster, and Mr. H. T. Wakelam, M.INST.C.E., F.G.S., the county engineer of Middlesex, was formally installed as president in succession to Mr. J. S. Pickering, M.INST.C.E., the borough surveyor and water engineer of Coventry. Meetings of the council and the subscribers to the Orphan Fund were, as usual, held before the commencement of the proceedings. Following the preliminary business, which included the consideration of the annual report, the presentation of premiums and the delivery of the presidential address, there was an informal discussion on town planning, at which Mr. Raymond Unwin, town planning assistant to the Local Government Board, was present, after which the members adjourned for luncheon. The discussion of papers commenced in the afternoon, and will be continued to-day. Lack of space prevents our giving more than a severely-condensed account of yesterday morning's proceedings, our intention being to print a full report in next week's issue, in which also will appear a first instalment of the debates on the various papers.

When Mr. Wakelam rose to deliver his address yesterday there were present Sir James Lemon (Southampton), Messrs. G. Alves (Glastonbury), W. P. Anderson (Winchester), W. Ashbee (Middlesex), B. Ball (Singapore), J. Patten Barber (Islington), W. E. Beacham (Leek), J. Berry (Kingstown), C. P. Billing (Bristol), J. Birch (East Ham), W. J. Bird (Midsomer Norton), W. N. Blair (St. Pancras), W. T. Body (Birmingham), H. Percy Boulnois (Westminster), J. Bowen (Reading), T. Bowes (Hereford), C. H. Bradshaw (Middlesex), J. A. Bridge (Birmingham), A. T. Bridgewater (East Ham), C. Brown (Edmonton), R. Brown (Southall-Norwood), C. Brownridge (Birkenhead), J. Bryson (Midcalder), F. L. Burch (Dorchester), W. Burn (Sutton-in-Ashfield), A. Burton (Stoke-on-Trent), T. Caink (Worcester), W. L. Carr (Ruislip-Northwood), G. F. Carter (Croydon), S. H. Chambers (Hampton), H. T. Chapman (Kent), T. Charles (Harrow), R. Chart (Coulsdon and Purley), H. A. Clarke (Briton Ferry), W. A. T. Clarry (Sutton Coldfield), C. A. Clews (Derby), R. H. Clucas (Kingston-on-Thames), J. W. Cockrill (Great Yarmouth), T. Cole (Westminster), T. P. Collinge (Rotherham), A. E. Collins (Norwich), H. Collins (Colchester), R. Collins (Enfield), J. S. Crawshaw (Weybridge), R. Craig (Bromley Rural District Council), J. W. Croxford (Brentford), R. H. Crummack (Dover), E. H. Crump (Hinckley), G. Davies (Widnes), S. H. Davies (Wirral), N. F. Dennis (West Hartlepool), J. Diggle (Hyde), P. Dodd (Wandsworth), S. Douglas (Kenilworth), S. R. Drake (Leatherhead), W. J. Dresden (Battersea), J. W. Drew (Wath-upon-Dearne), J. Eastwood (Sowerby Bridge), J. Edey (St. Neots), W. H. Eley (Newmarket), E. J. Elford (Southend-on-Sea), J. England (Wrexham), J. Price Evans (Wrexham), T. W. Evans (Smethwick), W. A. Farnham (Sidcup), H. C. Fread (Esher and the Dittons), A. R. Finch (Kensington), W. Fowlds (Keighley), T. P. Frank (Stockton-on-Tees), S. S. Gettings (Tring), W. J. Goodwin (Salisbury), A. D. Greatorex (West Bromwich), G. Green (Wolverhampton), W. H. Grieves (Sutton, Surrey), H. J. Gullan (Belfast), G. Haigh (Southall), H. Hardy (Barrow-in-Furness), W. Harpur (Cardiff), J. Harris (Tonbridge Rural District Council), J. C. Harris (Norwich), E. Y. Harrison (Guildford), P. T. Harrison (Chelmsford), T. Henry (East Retford), H. Holmes (Ossett), R. Holt (Leeds), A. Hosken (Smethwick), H. Inglis (Rutherglen), A. C. James (Grays), J. Jeffery (Dunmow), R. H. Jeffes (Maldens and Coombe), J. Johnson (Rawtenstall), W. M. Jones (Chester), W. H. Jukes (Tipton), J. Julian (Cambridge), C. C. Keep (Westminster), J. D. Kennedy (Retford), P. G. Killick (Finsbury), F. O. Kirby (Doncaster), G. W. Lacey (Oswestry), W. T. Lancashire (Leeds), A. J. Lander (Middlesex), H. W. Longdin (Penge), W. F. Loveday (Stoke Newington), R. A. Macbrair (Lincoln), J. McCallum (Uxbridge Rural District Council), D. McInnes (Edinburgh), L. S. McKenzie (Bristol), J. Marshall (Malling), H. J. Marten (London), F. Massie (Wakefield), E. R. Matthews (University of London), H. Miller (Ipswich), R. Moir (Edinburgh), J. Moncur (Stafford), J. H. Montgomery (Llanelly), T. Moulding (Exeter), A. E. Nichols (Folkestone), P. H. Palmer (Hastings), J. H. Parkes, (Sutton Coldfield), F. Parr (Bridgwater), J. Paton (Plymouth), F. W. Pearce (Twickenham), T. S. Picton (Eccles), F. R. Phipps (Basingstoke), W. Plant (Stafford), S. S. Platt (Rochdale), A. J. Price (Lytham), W. B. Purser (Kesteven), J. C. Radford (Putney), W. Ransome (Worcester), F. Read (Gellygaer), J. M. Reed (Middlesex), W. Regester (Middlesex), E. J. Reynolds (Friern Barnet), H. L. Richardson (Worcester), W. Riley (Willesden), W. A. Riley (Birmingham), C. C. Rivers (Harogate), F. Roberts (Worthing), J. W. Dudley Robinson (Westminster, secretary), O. Claude Robson (Willesden), L. Roseveare (South Shields), A. J. Rousell (Whitley Bay), E. Y. Saunders (Barnstaple), J. S. Sawdon (St. Annes), J. A. Settle (Bury), J. E. Sharpe (Cheshunt), H. Shaw (Ilford), J. Siddalls (Tiverton), J. S. Sinclair (Widnes), F. W. Smart (Bedford), J. F. Smillie (Tynemouth), P. Smith (Bury), A. Spence (Dundee), J. P. Spencer (Tynemouth), F. W. Spurr (York), E. Stead (Somerset), A. Stevenson (Ayr), J. Stewart (Glasgow), H. E. Stilgoe (Birmingham), J. Storrar (Midlothian), W. Stubbs (Blackburn), J. Sutcliffe (Deptford), S. Sutcliffe (Mytholmroyd), D. Sutherland (Southgate), A. S. P. Taylor (Bedwas), A. C. Thomson (Midcalder), J. Thomson (Dundee), J. Taylor (Walsall), R. J. Thomas (Bucks), T. Tidswell (Sowerby Bridge), H. Tillstone (Brighton), M. Turnbull (Shildon), C. H. Walker (Loughborough), T. Walker (Ystradgynlais Rural District Council), J. W. Walshaw (Peterborough), J. R. Walters (Congleton), J. P. Wakeford (Wakefield), J. Watson (Strathaven), J. A. Webb (Hendon Rural District Council), J. S. Weir (Jarrow), H. G. Whyatt (Grimsby), R. Wilds (Walton-on-Thames), F. Wilkinson (Prestatyn), H. F. Wilkinson (Tottenham), J. Williams (Hampstead), E. Willis (Chiswick), O. E. Winter (Hampstead), R. H. Winterbottom (Irlam), and E. Worrall (Stretford).

Alderman W. REGESTER, J.P., chairman of the Middlesex County Council, in extending a welcome to the members, said these gentlemen, who were well-known members of their profession, had met to discuss quietly and calmly such important questions as town planning, the disposal of sewage, and traction—all of which he trusted would be brought into use for the advantage of the people of the country when the present crisis was overpast. It was a great pleasure to him, as chairman of the Middlesex County Council, to meet the members of the institution, and he must ask them, assembled as they were in a little Middlesex corner of London, to imagine themselves just across the road in the magnificent county hall erected jointly by Mr. Gibson and Mr. Wakelam, their new president. They had, Mr. Regester added, conferred an honour upon the county of Middlesex in electing the chief engineer of the county as their president for the coming year.

The PRESIDENT (Mr. J. S. Pickering) briefly returned thanks for the warm welcome they had received, and said it was generally recognised that their institution conferred a great benefit upon the community at large.

The minutes of the last general meeting were read by the secretary, Mr. J. W. DUDLEY ROBINSON, and duly confirmed.

The meeting then proceeded to consider the annual report of the council.

ANNUAL REPORT.

The report stated that during the financial year ended April 30th last 102 members, consisting of 43 members, 26 associate-members, and 33 students, were elected, while 13 members, 7 associate-members and 1 student resigned. The roll now stood at 1,769.

Members of the institution on active service numbered 134, and a list of these was given in the report.

Regret was expressed by the council that the outbreak of war had, for the time being, diverted the attention of the Local Government Board and local authorities from the important matter of superannuation.

FINANCES.

The financial position of the institution was reported to be in a very satisfactory condition. The only items showing an increase of any importance were salaries, due to the arrangements made on the appointment of Mr. Cole as consultant secretary, and amount

written off under investments; the latter item was due solely to the depreciation in trustee securities since the outbreak of war.

The receipts from subscriptions showed an increase, but other sources of income small decreases. A reduction in the amounts received on account of entrance fees, examination fees, and interest was to be attributed to the outbreak of war.

Turning to the balance-sheet, it was very satisfactory to see an increase of £374 2s. 4d. in the accumulated fund, indicating a substantial increase in the reserves, and, consequently, the stability of the institution. The arrears of subscriptions showed an increase, and the council appeal to members for the prompt payment of their subscriptions, even in the present hard times, as it is essential to progress towards the various objects of the institution.

The President moved the adoption of the report.

Mr. E. Willis (Chiswick) seconded, and suggested that in future the annual reports should contain some reference to the Orphan Fund. This was specially needed, as he found that only 12 per cent of the members were annual subscribers to the fund.

Mr. T. Henry (East Retford) said he would go further than Mr. Willis, and make it compulsory for every member to subscribe at least 5s. a year to the Orphan Fund. He suggested that they should alter the Articles of Association so as to bring upon the council urban and rural surveyors as well as surveyors of corporations. He congratulated the members upon the reduction of the printing account, and expressed a hope that it would be still further reduced in future.

Mr. H. Gilbert Whyatt (Grimsby) called attention to the omission of a report of the East Midland District from the annual report, and hoped it would be possible to have it inserted.

Mr. W. H. Grieves (Sutton) referred to the circular issued by the chairman of the North-Western District, and asked whether such a letter did not constitute canvassing in opposition to the by-laws of the institution.

Mr. M. Jones (Chester) considered that the issue of the circular referred to was canvassing under by-law 14, and, if so, he asked whether the election of the members concerned was valid.

Mr. Reginald Brown (Southall) deprecated continual attempts to alter the Articles of Association, and thought it was best to let the matter of the circular drop.

Mr. E. J. Elford (Southend-on-Sea) would hesitate to say that the circular constituted canvassing, but at the same time he thought the council were justified in dealing with it as they had.

Mr. A. J. Price (Lytham) did not think such a circular would be issued again. At the same time, the fact that all the gentlemen named in it were selected showed that they were men who really had the confidence of the institution generally. (Cries of "Oh!")

The President said that the secretary would bear in mind the suggestion with reference to drawing attention to the Orphan Fund in the annual report. He thought the circular to which several members had alluded might be allowed to drop. Its issue was certainly against the wishes of the council, and if it was not contrary to the letter of the by-laws it was contrary to their spirit.

At this point a portrait of the late Mr. Charles Jones, of Ealing, was unveiled amid applause, and the President, in the course of a eulogy of the character of Mr. Jones, said it was intended to hang the picture upon the walls of the institution's offices.

The premiums for papers having been presented, the meeting proceeded to the election of auditors and scrutineers, vacancies being filled by the appointment of Messrs. W. H. Grieves and R. Brown.

Mr. Pickering then installed Mr. H. T. Wakelam as president of the institution for the ensuing year, and invested him with the chain of office. Mr. Wakelam took the chair amid hearty applause. A vote of thanks to the retiring president was proposed by Sir J. Lemon, seconded by Mr. E. G. Mawbey, and carried with acclamation. Mr. Wakelam then rose and proceeded to read the following

PRESIDENTIAL ADDRESS.

In addressing you as your president, I acknowledge, with sincere appreciation, your kindness in electing me to the chair of the institution for the year 1915-16.

Being singled out to occupy the presidential chair is a great compliment, and means much in the way of satisfaction and encouragement to those upon whom the distinction is conferred.

To me the acceptance of the honour was somewhat difficult, because one felt that the task of fulfilling the position of president to one's own satisfaction had been made extremely onerous by the strenuous efforts of those who had preceded me, and by the conspicuous ability they displayed during their terms of office. One cannot by any means hope to excel, but if the spirit of emulation which has been inculcated in one's mind through a long association with past-presidents at council meetings will prove a momentum to success, I can lay claim to a desire to do all I can in the interests of the institution during my tenure of the presidential chair.

The term "engineering," as you all know, covers not only the construction of engines and machines, but embraces also the comprehensive field of docks, harbours, reclamation embankments, railways, canals, waterworks, sewage works, rivers works, bridges and roads; and also hydraulic, mining, electrical, motor and marine engineering.

The work of the engineer covers, therefore, an extremely wide field, the constant extension of which renders almost every department of physical science a necessary and fundamental part of a course of education, founded upon a proper basis of mathematics, for those entering the profession.

To a theoretical preparation there must, before a man can be said to be thoroughly equipped for his work, be added a sound practical training in the particular branch of the profession he chooses to follow, or wherein to specialise. It is a "long, long way" to final success, but in this way only can an engineer hope to succeed in his work. Such a training will enable him to bring to bear that thought, concentration and economical adaptation so necessary for that inventiveness and accommodation to circumstances which many members of this institution have so skilfully displayed in the past, and which have been the means of helping them to the high positions they hold in the profession, which positions they have so hardly won by efficient work and constant application. The measure of a man's theoretical knowledge is proved by his success before a board of examiners, but practical experience can only be obtained in the workshop and on works of construction, where a man will, if at all of an observant nature, quickly see how and where his theoretical ideas require modifications to meet actual constructional conditions. While I think it is absolutely necessary for a sound theoretical training to be afforded to beginners in the profession, I must confess that I have a sneaking liking for the man who possesses ideas prompted by practical work.

If I may be allowed to address a few words to the younger brethren, I would say, select as models two or three of the more successful practitioners of the institution and follow their examples. By so doing success will probably ensue. "Rome was not built in a day"; neither will the higher positions in the municipal and county engineering world be won in a day's work. Such positions are, however, always open to those who care to take the trouble—as our American friends would say—"to get there."

I would also impress upon the younger members the necessity for visiting works during the preparation of materials and during the actual constructional operations. The measure of a man's knowledge cannot always be judged from the length of his experience. For instance, two men may go through exactly the same job, and at the end one of the two may show a much greater knowledge of both its principles and details than the other. This arises from the degree of observation exercised by both men. Where one fails in this, another succeeds. Much can therefore be gained by observation, and the more visits that are made to works in progress the more knowledge will be gained by the observant student. In this connection it would, I think, be well for the junior members in each of the districts of the institution to band themselves together and arrange visits to works in progress on the lines of the visits made by students of the Institution of Civil Engineers.

While offering a word of encouragement to those juniors who have already started their professional careers, it would not perhaps be out of place (especially so as there are laymen present) if I also tendered a few remarks on the advantages of the engineering profession. With the world power of England—such as is held by no other nation—its vast possessions, its interests and influences, there is an almost unlimited field for a display of energy by men who possess constructive ability and capacity. In comparison with other professions, engineering offers many opportunities for men to gain, not only a good

[illegible] to the profession of engineering in which [illegible] are engaged [illegible].

[illegible] have been described as engaged in the work, [illegible] have possessed [illegible] and energy for hard work. In addition to [illegible] a constitution sufficient to withstand all kinds of weather and physical and mental strain form necessary attri[illegible].

With regard to the scholastic work of a boy desirous [illegible] will be [illegible] matics, mechanics, physics, chemistry and geometrical drawing. A boy [illegible] already referred to.

Should it be within the power of the parents to [illegible] school provided with laboratories and workshops, it would add greatly to his advantage. He would in this way combine theoretical study with practice of the kind he would obtain in an engineering works. This knowledge should fit the boy for the work he [illegible] and would prove to be a good [illegible] and would [illegible] apprenticeship [illegible] difficulty to those [illegible].

On the other hand, young men who have received [illegible] things which they cannot have learnt during their college course, and that it will take years of practical experience to complete their engineering education.

An artistic draughtsman who lacks that constructional knowledge which will enable him to prepare a sound specification explanatory of his work will not be able to keep pace in the world's competition with the man who can prepare a fairly good drawing with a specification fully explanatory of the practical work he desires should be carried out.

The work of the engineer is fast becoming more and more technical and important, and with the march of time and competition it appears to me that the best-trained men will have the greater chance of success, not only in the particular branch practised by members of this institution, but also in all other branches.

Going briefly into the history of engineering, we find that one of the first works of magnitude was carried out by those of whom we speak as "the ancients." It was no less a work than the construction of the canal uniting the Red Sea with the Nile. That canal [illegible] begun by Leostris. Others say that the work was carried out by Necos, and finished by Darius I., 525 B.C. To whomsoever the work may be properly assigned, its existence shows that engineers were actively at work many centuries ago.

As one of the first engineering works of which we have an authentic record was in connection with the Nile, it may not be misplaced if I recall the fact that within recent years a stupendous engineering feat, known as the Nile dam, was carried out across the same river, with which work a present eminent member of this institution was conspicuously connected.

Previously to the eighteenth century there were many celebrated undertakings carried out by engineers, among them being the dome of St. Mary's, Florence, by Brunelleschi, and the dome of St. Peter's, Rome, by Michael Angelo. Other great engineers who practised centuries ago were San Michalin, the supposed inventor of the military bastion system, and Pagan and Vauban, who were both celebrated in their different branches of work.

During the eighteenth and nineteenth centuries, and also in our own time, there have been many successful engineering achievements of considerable magnitude connected with which, during the more later period, both past and present members of this institution were engaged. In regard to some of the achievements for which members have been responsible one may refer to large extensions of the main drainage works of the Metropolis, the main drainage works of Frankfort-on-the-Main, the supply of water from Wales to Liverpool, the supply of water from Wales to Birmingham, and the additional supplies of water to London. The Manchester Ship Canal, the Forth Bridge, the Tay Bridge, the Tower Bridge, the Simplon Tunnel, the Severn Tunnel, the Mersey tunnels and the Thames tunnels, and many other works, comprising vast undertakings and expenditures, have also been carried out within comparatively recent times.

The Victorian era saw many of the large trunk railways and canals of this country brought into operation, while it appears but yesterday that the Great Central Railway and several of the large metropolitan tube railways were completed and opened to traffic. The original construction of railways in this country gave a great impetus to the work of the engineer. Some of the undertakings which made such men as Stephenson, Telford, Brunel and others famous are the bridge over the Tyne, the bridge across the Menai Straits, and the tubular bridge at Saltash, which monuments appeal to us to-day.

Those members who are acquainted with the works I have enumerated may with pride arrogate to themselves the satisfaction of being connected with a profession which has produced men of the capacity of those who carried out the works to which I have referred.

The particular branch of engineering in which most of us are engaged does not offer or afford many opportunities for an exhibition of that skill which is required for undertakings such as some of those I have mentioned. Opportunities have, however, arisen in connection with many engineering schemes, and with sewage and water works in particular, for proving the grit of many of the present members of this institution. The successful results of their labours cannot be otherwise than most gratifying to us all.

With the cheap facilities for travel and mental equipment now obtainable, I am constrained to think that members of our body will carry on and will worthily uphold the traditions of the past, and that the succeeding years will bring to the presidential chair men who in every way are well versed in their profession, and well equipped for the position.

Since the passing of the Public Health Act, 1875, a sum greatly exceeding £100,000,000 (roughly estimated from returns) has been expended in connection with the disposal of sewage and water supplies in England and Wales alone.

That the expenditures have been justified and warranted is amply proved by a glance at the public health statistics which have been compiled since the date of the passing of that Act. The returns show a very large decrease in the annual death-rate since that time. The diminution in this connection is in itself a sufficient justification for the expenditures, apart from the comforts and cleanliness experienced, and apart also from the amelioration of the poorer classes from the dirty and filthy surroundings which obtained in many parts of our large cities and towns previously to the passing of the Act of 1875.

This institution was first started in the year 1873, and it may, I think, lay claim to being the pioneer of the movement which has proved so eminently successful in the interests of public health, and to the lion's share of credit for the improvement and life-saving efforts made so manifest in the statistical returns I have already referred to. Long may such efforts continue!

The question of local improvements for the well-being of the working classes is, to my mind, a very important subject, and housing schemes for their welfare should be fostered, advanced and supported on every occasion by the members of the institution. The Housing Acts are important measures, and by constantly advocating the adoption of their provisions the members of this institution will still further add to the advancement and health-giving surroundings of the community. Environment in daily life has great influences for good or evil. The brighter the surroundings the greater the incentive to moral improvement and self-respect of mankind, and therefore, as I have said, to foster brighter surroundings is a move in the direction of obtaining something for the poorer classes, especially, which will educate them towards self-respect and cleaner habits, which object alone is worthy of our best endeavours.

In connection with the Housing (No. 2) Act, passed during the last Parliamentary Session, the National Housing and Town Planning Council have published a memorandum of value, giving, among other things, details of, and the clauses relating to, loans to be granted. I commend the memorandum to those

members who at present have housing schemes in hand. I would also commend to the notice of those members of the institution from rural areas who are dealing with the housing problem the model plans for cottages which have received the approval of the Board of Agriculture and Fisheries, and of which copies can now be obtained direct from Messrs. Wyman & Sons, Fetter-lane, or through any bookseller. With regard to the proposals of the kind for rural districts, the late President of the Local Government Board offered a short time ago some interesting remarks. It has been said that cottages in rural areas could not be built and let to give any return of interest at anything below a rental of 5s. per week. Mr. Samuel's view is that if the agricultural labourer cannot afford to pay a rental of 5s., there are others, in almost every village, such as policemen, postmen, railwaymen, carpenters, blacksmiths, and men of other occupations, who could afford such a rental, and by building new cottages which such people may occupy it would free the cheaper buildings in which they now reside for occupation by their poorer neighbours. Mr. Samuel's suggestion should receive the most careful consideration, and should his proposal find favour at the hands of local authorities, those members of this institution who are connected therewith will, I feel certain, do their utmost to devise workable schemes and assist in so good a cause.

During the last fifteen or sixteen years great changes have manifested themselves in the methods employed in connection with road maintenance and construction. The changes have been brought about by the enforced requirements to sustain the traffic of the large numerical increase in mechanically propelled vehicles now using the roads of the country.

It seems but yesterday since the first trial run of motor cars to Brighton took place. I well remember the start of some thirty-three cars at 10 o'clock in the morning from the Hotel Metropole, Northumberland-avenue, in November, 1896, when many of the onlookers made fun of the (to them) snorting monsters, which emitted stinks of 20-horse power, and for which monsters many prophecies, to the effect that they were doomed to failure, were made. After a somewhat unexciting contest a few of the cars arrived at Brighton at a late hour the same day, while others arrived the next day, and others not at all. There were innumerable stoppages on the way, and much jeering from spectators along the route. How different to-day! Thanks to the motor engineer, cars have been so improved in the course of a few years that the Brighton journey can now be comfortably done in a little more than two hours.

At the same time the motor engineer, by introducing cars, was primarily the cause of the rapid deterioration which took place in connection with the carriageways of this country. As a set-off he has also primarily been the cause of the remarkable improvements to be seen on all sides in connection with the roads generally throughout the kingdom. When it was seen that the motor car had come to stay, steps from a road point of view had perforce to be taken to cope with its requirements, and members of this institution have been endeavouring, during the last ten or eleven years in particular, to produce carriageway surfaces suited to the requirements of motor traffic. The result of their labour has, I venture to say, been most satisfactory, as it is now admitted by experts on the subject from foreign countries that our roads, taken as a whole, are the best in the world. This despite the fact that during the last two years especially the endeavours of the road engineers of this country have been rendered infinitely more difficult by the extraordinary stress of the more modern vehicle and motor omnibus. In this connection the Government decided a short time ago to appoint two committees, one to consider the technical aspect of the question of damage to roads by such vehicles, and the other to consider the wider question as to the proper payment, if any, to be made by their owners towards the upkeep of the roads they use. Road authorities have no desire to throttle either commerce or trade, their only wish in this connection being that a settlement on a fair and equitable basis in the general interest shall be arrived at.

The subject heading of "The Improvement of Highways to Meet Modern Conditions of Traffic," on which papers will be before you to-day, is still one for much consideration and thought. Literally construed, the heading covers a comprehensive field in relation to road management, construction and upkeep as practised by us to-day.

It may truthfully be said that in this connection a new era in a somewhat specialised branch of engineering has set in. The innumerable brochures, papers and publications which have appeared on the road question during the last two or three years prove that there is still a large field open for inquiry and research.

There are factors which will always govern road construction and maintenance in this country; among them may be mentioned climatic, economic, and supply-and-demand conditions, which are all applicable, in varying degrees, to the different topographical and geographical areas of the kingdom. In discussing and considering the road question, these conditions, with other local circumstances, must be borne in mind. A comparison as to cost, method of repair, &c., of roads in the South of England, for instance, with roads in the North is no guide as to procedure, neither is it fair to compare systems of upkeep of roads in the Eastern Counties with those practised in the Western areas. Intercourse and discussions at our meetings on these and other subjects affecting our calling must necessarily help us in offering our final professional advice to our respective authorities. We are always much indebted to writers of papers for affording us opportunities for becoming more enlightened in any particular branch of our work, and especially so in regard to the work which has been made so difficult by the requirements of modern traffic. It has been said that "the man who stays at home never sees anything." The saying is perfectly true, and I am quite sure that it is of the greatest advantage to local authorities when their professional advisers are allowed and encouraged to attend meetings of this institution to discuss papers of the kind you will have before you to-day.

There is still room for thought and consideration in regard to—

- The planning of arterial and other roads.
- The classification of roads.
- The maintenance of roads.
- The improvement of existing highways and bridges.
- Bituminous methods as now practised.
- Tar-painting road surfaces.
- The use of mechanically-propelled vehicles *v.* horse-drawn vehicles for road purposes.
- Road signs.
- The restriction and control of heavy traffic, both as regards weight and speed.
- Experiments and tests of road materials.
- Local administration.
- Economic procedure.

As regards the question of "road classification," some of you will remember the suggestion I made in a paper submitted to this institution as far back as June, 1906, as to the necessity for a general scheme of the kind for the whole of the country. It is satisfactory to all of us, and to me in particular, that such a scheme is now being formulated by the Road Board, which scheme will, I hope, soon be definitely settled and working satisfactorily.

That paper contained also another suggestion to the effect that subsidies should be supplied from funds provided by the Government for the particular purpose of assisting county councils generally to make grants towards roads of different classes. A consummation of our hopes in this connection will, I trust, be realised directly a favourable opportunity arrives, and the Treasury finds itself in a position to make grants for the purpose.

In connection with "economic procedure," I think that if road engineers would look a little more into the question of "cost *v.* life" before deciding upon the kind of materials they propose recommending to their authorities, an elimination of "the chaff from the wheat," so to say, would quickly ensue. When it comes to be remembered that every single additional penny expended per square yard per annum on the maintenance of the roads of England and Wales, added to the roads bill, means an additional million of money to be annually found by the ratepayer, the point of "cost *v.* life" of road materials will be seen to be the most important monetary factor to be considered in connection with local government.

In the paper submitted by me to the institution in June, 1906, I mentioned the fact that there was then a great want of a material for road surfacing which would afford a life commensurate with its cost, and would come, in price, between creosoted wood paving and ordinary tar-painted water-bound metalling. This problem has not yet been fully solved. Although this be the case, there are now several materials on the market tending to this end, and I am constrained to

believe that, by the efforts of the members of this Institution jointly with those of the ready local element and the contractor, a full solution of the problem will be forthcoming.

You will agree when I say that a codification of the different Highways Acts now in operation should take place at the earliest moment. So much overlapping as at present exists in this connection is regrettable, and I do not think there is a single person present who would not welcome such a codification of the existing laws in relation to highway management and administration in this country.

We all welcome the request now being made by the County Councils Association to the Local Government Board for general regulations to be framed to deal effectually with—

The construction of road vehicles.
The number of passengers and weight to be carried.
The testing and licensing of drivers.
The mechanical fitness of the engines, gear, &c.
The routes to be followed.
Any other matters which will tend to secure proper conduct on the part of the drivers and conductors of vehicles plying for hire and for the safety of the public.

You will, I feel confident, join with me, and express an earnest desire to see issued at an early date improved regulations dealing with the points I have enumerated. Such regulations would assist authorities enormously in their endeavours to secure improved road surfaces. In connection with licences to drivers, it would prevent partly-blind persons being authorised, as at present, on payment of five shillings for a licence, to endanger the lives of many people. Under the present regulations there is nothing to prevent even a totally blind person being licensed to drive a motor vehicle, plying for hire or otherwise!

Next to the "road question" I think that of "town planning" has, during the last three or four years, been most in the limelight. Town planning is an engrossing subject, and the agitation in connection with it has probably done more for the education of the municipal engineer, in regard to the requirements and beautifying of towns, than any other project during the annals of the institution.

In mentioning the question of town planning, I would repeat the observations I made at the annual meeting at Cheltenham last year, in regard to arterial roads, which roads must be considered to form an indispensable part of town planning. As I said at that meeting, the lines of all proposed arterial roads should, to my mind, be laid down and finally settled before town planning schemes are decided upon. The latter could then be superimposed on the proposed arterial lines, so to say, and so form a complete whole instead of having some localities dealt with under the Town Planning Act and isolated from the main routes, which, undoubtedly, will be the case if town areas are laid out before the main arterial roads are settled.

The papers you will have before you for discussion have been written by prominent members of our body, and the discussions arising therefrom should prove of much value to the institution generally. I, personally, am much obliged to each of the writers for coming forward with a communication, especially at such a time as this, when probably every office in the kingdom has, to some extent, a depleted staff owing to the uncontrollable and deplorable circumstances of the war, in which so many nations are engaged.

Before closing I should like for a moment to refer to the Road Exhibition and Conference to be opened to-morrow at the Horticultural Hall under the auspices of the County Councils Association. Anything introduced by public bodies outside the institution who are connected with the welfare and upkeep of roads to the extent the County Councils Association is interested in the subject, should have the support of the members of the institution, and I commend the exhibition to your notice. None of you will, I am quite sure, lose anything by paying it a visit.

In concluding, let me say that the absence of so many members from the meeting to-day has, undoubtedly, been caused by the dreadful war that has been proceeding so long. To those absent members who are serving their country we send our best wishes for a safe and speedy return, and let us hope that when peace is declared it may be of a lasting nature! In this connection also let us sincerely hope that no more mad dogs will be let loose in Europe for very many centuries to deal with "scraps of paper."

Gentlemen, I will now thank you for listening to me so patiently, and for the kind way you have welcomed me as your president to-day. I am more than grateful for your mark of consideration, and can only again repeat that I hope to do all I can during my year of office for the benefit of the institution with which I am deeply concerned in regard to the interests it represents.

(To be continued.)

ORPHAN FUND MEETING.

The annual meeting of the subscribers to the Orphan Fund was held in the morning, the president, Mr. J. S. Pickering, in the chair.

Mr. O. CLAUDE ROBSON, hon. secretary and hon. treasurer, read the annual report, as follows:—

ANNUAL REPORT.

To the Subscribers to the Orphan Fund of the Institution of Municipal and County Engineers.

GENTLEMEN,—The committee entrusted with the management of the Orphan Fund instituted in 1900 beg to report but little variation in the income and expenditure during the year 1914 as compared to that of the preceding year. This may be considered fairly satisfactory, looking to the abnormal conditions prevailing during the last five months of the year, with many members away on service, and with the many demands made upon those remaining, owing to the dreadful war now devastating Europe.

The comparative results of revenue and expenditure for the two years may be summarised as follows:

	1913			1914		
Revenue	£	s.	d.	£	s.	d.
Balance from previous year	180	10	3	117	2	7
Donations	15	1	10	12	15	0
Subscriptions	139	18	6	135	12	6
Collections at meetings	28	14	3	43	17	9
Interest on investments	36	10	6	37	3	4
Total ...	£400	15	4	£344	11	2
Expenditure:						
Grants to orphans ...	170	0	0	160	0	0
Printing, stationery, postages, &c.	9	17	3	6	19	8
Purchase of London County 3½ stock ...	100	0	0	100	0	0
Transfer of stocks to new trustees	3	15	6	—	—	—
Balance carried forward	117	2	7	77	11	6
Total	£400	15	4	£344	11	2

The capital invested has been increased by the purchase of £100 of London County Council 3 per cent Stock on December 30, 1914, making a face value total of £1,463 10s. 10d. now invested, the various securities representing this sum being shown upon the balance-sheet.

The value of the investments was estimated according to the prices ruling in January, 1915, and, as may be readily understood, show a considerable reduction upon the market prices prior to the war. The investments, however, consist entirely of gilt-edged securities, and it is hoped will proportionately rise with the advent of peace.

CASH ACCOUNT FOR THE YEAR ENDING DECEMBER 31ST, 1914.

Examined and approved,
WOOD, DREW & CO.,
Chartered Accountants.

London: 139 Cannon-street, E.C.
2nd June, 1915.

The cash balance available at the end of the year was £77 11s. 6d., as shown upon the balance-sheet hereunto appended, which has been duly audited and found correct by the auditors of the institution, Messrs. Wood, Drew & Co., of 139 Cannon-street, E.C.

The number of subscribers to the fund has been 210, as compared with 227 in 1913; but, on the other hand, the amount of the collections made at the various district meetings has increased from £28 14s. 3d. in 1913 to £43 17s. 9d. in 1914, an appreciable addition to our income which somewhat reconciles us to the decreased subscriptions, as doubtless much of the amount received from these meetings might be reasonably included as subscriptions, although anonymous.

While fully recognising the many calls we have upon us during this period of stress, your committee would, nevertheless, beg the subscribers still to do their best to induce other members of the institution to assist the fund, be the amount ever so small, as with 130 members of the institution now serving His Majesty, it is within the bounds of probability that abnormal claims may be made during the current year, when it is hoped we at home may endeavour to lighten the burden of those who may be left with inadequate means of subsistence.

Charity, they say, begins at home, and it therefore behoves all of us to do our utmost for children of our professional brethren should necessity through this dreadful strife demand it.

At the present time 210 out of the members of the institution are subscribers to the fund, and this, we hope, will be considerably increased when the report of 1915 is published.

The amount of subscriptions and donations for the year 1914 may be divided among the various districts as follows—viz.:—

Name of District.	Donations. £ s. d.	Subscriptions. £ s. d.	Total. £ s. d.
East-Midland ...	2 13 7	19 11 0	22 5 1
Eastern ...	11 13 6	21 18 0	33 11 6
West-Midland		15 15 0	15 15 0
Metropolitan ...	—	17 1 0	17 1 0
North-Eastern ...	3 10 0	13 2 0	16 12 0
North-Western	—	9 19 0	9 19 0
Southern ...		10 9 6	10 9 6
South-Eastern ...	4 17 6	4 11 0	9 11 6
South-Western ...		2 0 0	2 0 0
Welsh (North)	1 10 0	0 15 6	1 6 6
Welsh (South) ...	-	4 13 0	4 13 0
Scottish ...	6 19 2	1 1 0	8 0 2
India and the Colonies ...	1 3 0	2 2 0	3 5 0
Miscellaneous ...	18 13 6	1 1 0	19 13 6
Non-members ...	6 11 0	2 9 0	10 0 0

The number of children benefited by the fund during the year has been twenty-two, but this does not include one child for whom a presentation to the British Orphan Asylum was purchased in 1909, and which expires in 1916.

In all cases every inquiry was made as to the *bona fides* of each applicant for a grant, and your committee have no hesitation in stating that every one of the grantees were sadly in need of help when the fund was opportunely brought to their assistance.

The vacancies upon the committee occurring during the year were filled by the retiring members, Messrs. J. Patten Barber, A. H. Campbell, W. Harpur, and W. H. Leete, while Mr. O. Claude Robson was elected as hon. secretary and hon. treasurer.

We have to report that the Ladies' Committee proposed at the last annual meeting has hitherto been unable to organise any assistance for the fund, but they hope to be more successful at a later date.

List of Donations and Subscriptions for the Year ended December 31, 1914.

The CHAIRMAN moved the adoption of the report.

Mr. H. G. WHYATT remarked that the reason why the ladies had not been able to do anything during the year was because their efforts had been directed to other channels since August. Inasmuch as there was a possibility of further demands upon the fund as the outcome of the war, he was rather sorry to find that the number of subscribers remained so small. At the same time it was satisfactory that the total receipts were so well maintained.

Mr. J. W. COCKRILL said it was not an easy matter for the ladies to hold a meeting, and as a consequence the business of their committee must necessarily be done by correspondence.

Mr. H. PERCY BOULNOIS asked if it was possible for the parent institution to subsidise the Orphan Fund in any way. It was not creditable to the members that the fund was not better supported. Would it not be possible, for instance, to set aside the profits from the "Journal" to aid the fund?

The CHAIRMAN stated that the matter had been discussed, and that it was found impossible to do anything of the kind suggested under the Articles of Association.

Mr. BOULNOIS, with the permission of the chairman, eventually moved that the council be asked to consider whether it would be possible, under the Articles of Association, to render financial support to the Orphan Fund by devoting the profits arising from the "Journal" towards the fund.

Mr. COCKRILL seconded, and the proposition was agreed to unanimously.

It was announced by Mr. THOMAS COLE that in the ballot for the election of the committee the list had been elected unanimously. The CHAIRMAN explained that the vacancy caused by the resignation of Mr. A. H. Campbell (Edinburgh) had been filled by the election of Mr. Thomas Cole.

Mr. E. WILLIS proposed the re-election of Mr. O. Claude Robson as hon. secretary and hon. treasurer.

Mr. G. W. LACEY seconded, and the motion was agreed to with unanimity.

Mr. ROBSON, in again accepting office, insisted upon the necessity for younger blood being introduced. It appeared to him that the proportion of subscribers to the membership of the institution was far from satisfactory. If they only had a thousand members subscribing, say, 5s. apiece yearly, the position of the fund might be pretty well assured. It was not satisfactory that there were only 220 subscribers to the fund.

Mr. COCKRILL said he did not regard the position as being unsatisfactory, and he was sure that if there happened to be a larger demand upon the fund the members would rise to the occasion. There was no occasion to be pessimistic.

THE NEW PRESIDENT.

Mr. Henry T. Wakelam, M.INST.C.E., F.G.S., the new president of the Institution of Municipal and County Engineers, has had many years' experience in his profession. He commenced his career by serving with a mining engineer, and afterwards served a five-years' pupilage with a civil engineer and architect with both public and private practice. At the expiration of his articles Mr. Wakelam acted as resident engineer under the late Mr. W. H. Wheeler, M.INST.C.E. (well known in the Eastern Counties), and as resident, deputy and chief in other positions. Seventeen years ago he was appointed county surveyor and architect by the county council of Middlesex, receiving, some fifteen years ago, by resolution of that council, the designation of county engineer.

During the time Mr. Wakelam has held his appointment in Middlesex he has had charge and control of the engineering, architectural and surveying work of the county, which has embraced extensive light railway and tramway schemes, between forty and fifty bridges, and extensive works including new roads, improvements, and widening works. The last-mentioned included the construction of many miles of new sewers, and the diversion and laying of many miles of gas and water mains, ranging from 6 in. to 42 in. in diameter. The total amount expended on the schemes exceeded £2,000,000 sterling. Since his appointment to Middlesex Mr. Wakelam has also controlled an expenditure of between £2,000,000 and £3,000,000 more. At present he has in hand the construction of the new Great West Road, which is estimated to cost just over £500,000 sterling.

During his association with the rapidly growing area of which he has charge, Mr. Wakelam has carried out many new buildings, including petty sessional courts at Acton, Brentford, Ealing, Enfield, Hendon, Feltham, and Harlesden, and other buildings, the cost of these amounting to about £60,000. He has also recently acted in collaboration with Mr. J. S. Gibson in connection with the erection of the new Guildhall for Middlesex, at a cost of some £80,000.

In connection with the County Rivers Pollution (Special) Acts, Mr. Wakelam has under his charge about 125 miles of rivers and streams, upon which a large number of men are constantly employed in cleansing

and widening operations, and so forth. In this branch he exercises supervision, so far as pollution is concerned, over the many public and private sewage outfalls in the county. Mr. Wakelam controls also the upkeep, widening works and improvements carried out in connection with the main roads directly maintained by the county council. In this department he has kept pace with the times in all matters relating to the methods of resurfacings to meet the requirements of modern traffic. His experience has covered arbitrations and negotiations, a large amount of Parliamentary work (both in promotions and oppositions) in regard to Railway Bills, Tramway Bills, Road Bills, Electric Light Bills, water supplies and sewage schemes.

Previously to his present appointment Mr. Wakelam acted as county surveyor and architect to the Herefordshire County Council, in which position he had charge of some 500 miles of main roads, about 400 county bridges, and the county buildings.

He was admitted an associate-member of the Institution of Civil Engineers in 1883, and was transferred to the class of member in 1900. He joined the institution of which he is now president in 1888, and has been a Fellow of the Geological Society for many years. Mr. Wakelam is a past-president of the County Surveyors' Society, and a past (co-opted) president of the Institute of Sanitary Engineers. He is on the Board of Examiners, and was recently re-elected chairman of the Eastern District of the Institution of Municipal and County Engineers, and has been a frequent contributor of papers for discussion at the various gatherings of the institution and otherwise. He has also been chairman of the Roads Committee of the institution. He is a member of the Highways Committee of the County Councils Association, and was also a delegate to the Road Congresses held in Paris and Brussels.

Mr. Wakelam formerly held commissions as Lieutenant in the 6th Lancashire Artillery and as Captain in the 1st Herefordshire Rifles.

It will be within recollection that Mr. Wakelam was one of those left in the final selection for the appointment of chief engineer under the London County Council, withdrawing therefrom at the last moment.

Arterial Roads in Greater London: Southern Section.—At a meeting of the Southern Sectional Conference at the Local Government Board offices on Friday last, recommendations for the construction of roads connecting Merton and Sutton and Lordship-lane Station with Clapham Common, and for a by-pass road at Epsom, and extending the proposed Croydon by-pass road, were considered. The proposals regarding the Merton and Sutton and the Lordship-lane and Clapham Common roads were agreed to, but that with reference to the Croydon by-pass road was referred back to the sub-committee for further consideration.

National Guard Engineers.—On the 12th inst., by permission of Colonel Sir Edward Raban, K.C.B., R.E., a detachment of the City of London National Guard Engineers' Unit, under Colonel C. E. Cassal, V.D. (Commandant), visited some of the entrenchments constructed for the defence of London under the supervision of the Corps of Royal Engineers. The National Guard Engineers were received by Colonel W. Pitt, C.B.E., who showed and explained the works, which form part of those constructed by infantry battalions of the New Army under the direction of civil engineers, who have lent their services to the War Office, supervised by a R.E. officer for each length of from 15 to 20 miles.

Relief for Professional Classes.—The Professional Classes War Relief Council issues a report of six months' work which shows at once not only the great need that existed for such an organisation, but the variety of means that have been employed. The applications during the six months ending May 6th numbered 2,000, and the number of cases dealt with or now on the books is 1,600. One hundred cases were referred to other societies. The expenditure is now at the rate of £430 per week, and unless a sum of £25,000 can be raised in the next few months the work cannot be continued. It must be reiterated that no other body is doing exactly the same kind of work, in trying by co-ordination of existing benevolent funds, as well as by their own specialised forms of assistance, to tide over the professional classes who are so heavily penalised by the war. The offices of the council are 13 and 14 Prince's-gate, S.W.

TOWN PLANNING IN SCOTLAND.*

By Jas. Thomson,
City Engineer of Dundee.

In submitting a few notes on "Town Planning in Scotland," it will be appropriate, notwithstanding the possibilities of the subject, that any observations I have to make on what is being done in the North should be general rather than detailed or statistical.

Several enthusiastic students of town planning—legal, engineering and architectural—who are engaged on town planning schemes for the cities of Edinburgh, Glasgow, Dundee and Dunfermline, and for the county of Lanark, have been for some time, and will continue to be, engaged at meetings held periodically in these cities considering the provisions of the Act of 1909, and adjusting their draft schemes to the requirements of towns and counties in Scotland.

The result of these conferences will certainly be that a degree of uniformity in the preparation of schemes will be reached which could not be attained by individual action, and that the work of the Local Government Board for Scotland in the revisal and disposal of applications will be greatly facilitated.

It must not be assumed, however, that any attempt is being made to standardise the schemes, because the requirements of the respective districts, in many instances, differ materially. To standardise is impossible, but it is believed that, with the combined legal, engineering and architectural experience of those taking part in the conferences a certain amount of uniformity and a general understanding will be arrived at on many points as to which there might otherwise be different conclusions and varying styles of expression.

For example, it is possible to be in agreement, or nearly so, regarding methods of preparing schemes, as to what should be the minimum width of streets, the minimum width between building lines, the maximum height of buildings, the minimum size of rooms, the minimum height of ceilings, the minimum open space about dwelling-houses, the minimum of sanitary conveniences, the maximum height of boundary walls and fences, as to advertising hoardings, interpretation of terms, penalties, and as to the extent to which control should be had over elevations by the responsible authority.

On the other hand, each responsible authority, having regard to local conditions and requirements, must judge for itself as to the maximum width of roads and the mode of construction; the number of dwelling-houses to the acre; as to whether there should be flatted tenements, and the height of these; whether houses of one room should be permitted; as to allowing temporary formation of streets; the extent to which owners should be relieved of the cost of forming wide roads, and as to the size and form of units.

Housing conditions in Scotland, it is well known, differ in some respects from the conditions prevailing in England, and that fact, to a moderate extent, has an effect on schemes of town planning in the former compared with schemes in the latter. The difference is not pronounced, but it exists nevertheless, and will be found particularly in districts in close proximity to industrial areas. With that exception it may be assumed that the application of town planning in Scotland is fairly uniform with the application in England.

Scottish Town Planning Schemes.

I cannot compare with certainty the progress of town planning in Scotland with the progress in England, but it may be interesting to know that in Scotland, up to the present time, the Local Government Board for Scotland have authorised the preparation of twenty town planning schemes, varying in area between 1,070 acres and 44 acres, and representing altogether an area of over 16,000 acres. These figures speak for themselves as to the success of the Act so far as it applies to Scotland.

Nor can I from personal knowledge deal with the necessities of England for a Housing and Town Planning Act; but I can, from intimate acquaintance with the three large cities of Scotland, speak to the fact that in Scotland the passing of the Act was welcomed by local authorities as a boon the benefits of which cannot yet be estimated, and this meeting may rely that the local authorities of Scotland are very much alive to the advantages to the whole community of the provisions of the Act, and,

* Paper read at a meeting of the Town Planning Institute on Wednesday.

National Road Exhibition.

OFFICIAL OPENING TO-DAY.

THE EXHIBITS.

To-day (Friday) the National Road Exhibition, organised primarily by the County Councils Association, will be officially opened at the Royal Horticultural Hall, Westminster, by the Right Hon. Walter Long, M.P., President of the Local Government Board. The chair will be taken at 1 p.m. by the Right Hon. Henry Hobhouse, chairman of the Somerset County Council. In the ordinary course of events the Fourth International Road Congress and Exhibition would have been held at Munich in March, 1916, but owing to the war this has been abandoned, and nothing definite has been decided with respect to it or any similar international congress. While the clash of arms has thus rudely disturbed the triennial congress, road problems still remain as pressing as—even more pressing than—ever, and it is the recognition of this that induced the County Councils Association to take the bold step of arranging, in co-operation with the Road Board, the Institution of Municipal and County Engineers, and the County Surveyors' Society, for a conference on lines similar to that held under the auspices of the association in 1909. The opening sitting of the conference will take place on Monday next.

There would appear to be special reasons for holding the conference and exhibition at the present juncture. It is pointed out that the heavy traffic due to an enormous mass of military transport in this country, together with the destruction of roads in many parts of Belgium and Northern France, tend to raise problems differing in degree and to some extent even in kind from those which have been previously submitted for consideration. A flood of illuminative light will be cast upon these problems by the discussion of papers by authorities on road construction and classification, while at the same time the exhibition will serve the practical end of bringing together the latest plant and machinery which the skill and enterprise of inventors and manufacturers have placed upon the market. While the war is yielding its present problems, which call for serious consideration, it is none the less important to bear in mind that in the future many grave issues will have to be dealt with, and not the least of these are the schemes of road improvement which have recently been prepared by county councils and other authorities, with the approval of the Road Board, to provide relief in the event of unemployment, which is anticipated as the result of releasing large bodies of men from military service.

The exhibition includes many of the principal firms connected with the road-making industry. The exhibits at the Horticultural Hall will consist chiefly of road materials, while a building in Greycoat-street, adjoining the hall, has been reserved for machinery and appliances.

The Organising Committee, it may be stated, includes the following:—

The Right Hon. H. Hobhouse (chairman of the Somerset County Council), chairman, Mr. J. Aspell (chairman of the Lancs. Highways Committee), Mr. H. Hampton Copnall (clerk to the Notts County Council), Colonel G. Dixon (chairman of the Cheshire County Council), Sir H. G. Fordham (chairman of the Cambridge County Council), Mr. T. H. B. Heslop (county surveyor of Norfolk), Mr. W. Rees Jeffreys (secretary to the Road Board), Mr. A. C. Pain (chairman of the Surrey Highways Committee), Mr. R. S. W. Perkins (county surveyor of the Isle of Ely), Mr. J. W. Dudley Robinson, B.Sc.(Lond.) (secretary Institution of Municipal and County Engineers), Mr. O. Claude Robson (engineer to the Willesden Urban District Council), Mr. H. E. Stilgoe (city engineer, Birmingham), and Mr. H. T. Wakelam (county engineer of Middlesex and president of the Institution of Municipal and County Engineers).

Mr. G. Montagu Harris, secretary of the County Councils Association, is the organising secretary, Mr. Francis Hyndman is assistant secretary, and the onerous task of business manager has been entrusted to Mr. A. F. May.

A special feature of next week's proceedings will consist of one of a series of conferences on the rebuilding of Belgium, with general reference to the destruction of the roads by war operations and military traffic. The paper on this subject is by M. Henri Vandervin, ingénieur et chef directeur des ponts et chaussées de Belgique.

GEORGE F. WEST & CO.

(Stand 14.)

Messrs. George F. West & Co., Caxton House, Westminster, are exhibiting examples of their lock woven mesh for concrete reinforcement (Nos. 40 and 14 mesh). Lock woven mesh reinforcement is woven of best quality drawn-steel wire having an ultimate strength of 88,000 lb. per square inch, and an elastic limit of 66,000 lb. per square inch. It can be laid by totally unskilled workmen, as the junction of the main and distributing wires are securely tied. It is impossible, therefore, unintentionally to change their positions in the slightest degree either before or after laying. Lock woven mesh is made in twenty-four styles, with square-inch sectional areas per foot of cross-section varying from ·0318 to ·4347. It is supplied in long length rolls, 4 ft. wide, as standard; other widths by special arrangement.

The company's Peerless woven wire fencing, heavy and light makes of which are exhibited, is the result of long experience. The principle kept in view is making provision for elasticity in a wire fence to meet varying changes in temperature; this is secured by the use of specially drawn and tempered steel wire of a quality standing almost double the tensile strain of ordinary soft fencing wire. The horizontal or "line" wires are securely bound together at regular

close intervals by upright wires, thus preventing the spreading of the horizontal wires. It is therefore eminently suited for the fencing of roads and railways, and for estate work generally, being strong enough to resist horses and heavy cattle, and yet close enough to keep out sheep and lambs.

AILSA CRAIG GRANITES, LIMITED.

(Stand 11.)

Samples of setts, cubes, chips, metal, briquettes and macadam make an interesting exhibit at the stand of the above company.

W. & F. ARCHER.

(Stands 32 & 33.)

Messrs. W. & F. Archer, Brettenham Brush Works, Edmonton, N., are exhibiting their road brooms at these stands.

CROMBIE'S PATENTS, LIMITED.

(Stands 64 & 65.)

An electrolytic system of sewage disposal will be brought to the notice of visitors to the exhibition by Crombie's Patents, Limited, Blomfield House, E.C. The crude sewage is run, without preliminary filtration, into the tanks containing the electrodes of special alloy. The anodes and cathodes are arranged alternately in the tanks, each plate sliding into grooves in the wall of the tank, and being so arranged that the maximum electrolytic action is obtained. The crude sewage, entering at the bottom of the tank, passes horizontally along the surface of each plate, and eventually leaves by the exit pipe, which is placed at the top of the tank. After passing through the electrolytic tanks, the treated sewage is run into settling tanks, where the suspended matter is deposited, and finally down a stoneware tower containing charcoal. The company claim that this fully treated effluent can be turned into any small stream or ornamental water without any undesirable effects whatever resulting.

TRUSSED CONCRETE STEEL COMPANY, LIMITED.

(Stand 5.)

The two main features of the above firm's exhibit will be their Hy-Rib material and their Atlas reinforcement for concrete roadbeds, and the attention of municipal and county engineers will be specially directed to the following:—

(1) Curved Hy-Rib, suitable for use in forming the concrete top of arched culverts. The closeness of the Hy-Rib lath does away with the necessity for any timber centering.

(2) Sample short length of Hy-Rib completely curved in the form of a pipe, suitable for use in pipe culverts.

(3) Sample of flat Hy-Rib, as used in ordinary building and partition work, exhibited in conjunction with the new type of pressed-steel section. These pressed-steel sections are sent out so that they can be easily fitted together, and special fastenings are provided for attaching to the Hy-Rib material.

(4) Atlas reinforcement for concrete road-beds. This is a new type of reinforcement for concrete road-beds, the advantages of which will be apparent on inspection. The sound engineering construction of the material, and the unlimited variations which can be made, both in the size of the spacing and the bars, are features which will readily commend themselves to all interested in concrete road-beds. The company are also exhibiting their Trus-Con waterproofing paste, which has been used by many of the leading corporations.

UNITED STATES STEEL PRODUCTS COMPANY.

(Stand 29.)

The above firm, whose London address is 36-38 New Broad-street, E.C., are exhibiting their triangle mesh concrete reinforcement. This mesh is made of cold drawn steel wire with a tensile strength of 85,000 lb. per square inch, and an elastic limit of 50,000 lb. per square inch. This is claimed to be far in excess of the strength possessed by any hot-rolled product, and it is therefore possible to use a much lighter weight of steel to obtain a given strength. The mesh is supplied in 18-in., 22-in., 26-in., 30-in., 34-in., 38-in., 42-in., 46-in., 50-in., 54-in., or 58-in. widths, and 150-ft., 200-ft., or 300-ft. lengths. The distance between longitudinal members is 4 in., and between cross-wires 2 in. or 4 in., as required. There are twenty-three styles, having a cross-section of steel per foot width of 0·41 to ·380 sq. in., the weight varying from 21 to 130 lb. per 100 sq. ft.

The British Fire Prevention Committee tested this material under fire and water, when classification "full protection" (Class B) was obtained. After the official test the floor was allowed to cool, and then reloaded with a load of 5 cwt. per square foot. The floor showed no signs of failure, and the deflection of the slab below the beams was only 0·4 in. Full particulars of these tests may be had on application for the committee's Red Book, No. 169. The material is particularly adapted for reinforced concrete slabs, partitions, beam and column wrapping. Being of the hinged joint construction, it can be bent or folded to a square or circle without deforming the cross wires or producing an initial stress. It is therefore very suitable for columns or piles. It is also particularly suited to reinforced concrete pipes. Many engineers who have been using concrete pavements have commenced to use steel reinforcement, thereby eliminating temperature cracks and reducing the necessary thickness of concrete required. It has been suggested that the cost of making trenches or repairs would be very high, but it has actually been shown that the cost is less than similar work on a stone pavement. A trench was made in 6½-in. thickness by drilling holes 12 in. apart and breaking the concrete between. This was replaced by work exactly the same as the original work, and cost 25 per cent less than would have been the case for a stone or brick pavement.

CAMBRIAN GRANITE QUARRIES, LIMITED.

(Stand 7.)

This company are proprietors of the Llanbedrog Granite Quarries, North Wales, which has a high name among road surveyors and engineers for its excellent qualities as a road macadam. Their exhibits are paving setts, cubes, machine-broken road macadam, and chippings. As a striking testimony to the quality of the Llanbedrog setts may be instanced the fact that some of these setts which had been laid for over forty years on a tramway in one of the busiest streets of Manchester were taken up recently, and found to show practically no sign of wear at all. In order to obtain an independent proof, the granite has been submitted to the standard tests for hardness and toughness carried out by the Road Board at the National Physical Laboratory, Teddington, and the results were stated to indicate that the quality of the stone is excellent as regards both toughness and attrition.

ALEXANDRA PAVING STONE COMPANY, LIMITED.

(Stand 7.)

The Alexandra Paving Stone Company, Limited, Vernon House, Sicilian-avenue, Southampton-row, W.C., are showing their well-known productions of Alexandra stone paving. At their Leicester works they manufacture their stone with 3 parts ¾-in. washed Leicester granite and 1 part best tested Portland cement. The matrices are specially graded, and the concrete thoroughly mixed and well made. The company has for the past twenty-five years supplied most of the principal towns, London and provincial corporations, urban district councils, railways and docks in England and Wales. The best testimonial, perhaps, that the company can possibly have is that its first customers have been and are still regular buyers. The company has over 70,000 yds. of 2-in. and 2½-in. thoroughly matured paving in stock, and can supply any orders at a few hours' notice. The company run another branch of the business for the building trade, and can execute any orders, however large, for architectural stone dressings, staircase work (cast or in situ), granolithic paving, Roman, mosaic, terrazzo paving, and so forth.

SIMPSON & CO.

(Stand 22.)

Messrs. Simpson & Co., 59 Victoria-street, S.W., are exhibiting plans and a working model of a patent mechanical hammer, which will be found of value for breaking up concrete road foundations and other similar work which is at present performed by navvies. It is claimed it is not only valuable as a labour-saving appliance, but works with precision, and wields a hammer [illegible] can be used by workmen. Demonstrations will be given at frequent intervals.

TAROADS SYNDICATE, LIMITED.

(Stand 28.)

The Taroads Syndicate, Limited, of 9 Victoria-street, Westminster, S.W., who are to be found at Stand 28, has in spite of the disorganisation of transit facilities which has necessarily resulted from military requirements in the shape of the conveyance of troops and war supplies, made successful progress in the contracts which it has undertaken.

The surface-spraying of roads with tar is a matter of extreme importance during war-time. The even distribution and penetration tend, as is universally appreciated, to strengthen, solidify and preserve the crust of the highways, so as to withstand the ravages of the exceptional and ponderous traffic caused by the transport of artillery, motor lorries and military equipment, materials and supplies, while the absence of dust, wherever roads have been tarred, is highly beneficial to troops on the march.

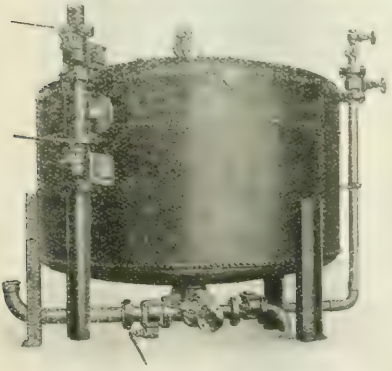
The syndicate's long experience in this class of contract, and the special facilities at its disposal, enables it to execute its work in a first-rate manner and with marked celerity. The mileage that will be sprayed during the present season constitutes a new record. Each of the highly efficient tar-spraying machines owned in large numbers by the syndicate is capable of spraying as much as 20,000 sq. yds. per diem, and surpasses, it is claimed, in speed and efficiency all other methods for the surface-treatment of roads; so that the advantages accruing to the roads may be enjoyed for the maximum period of the otherwise dust-infected months of the year.

The surface-treatment of roads by the syndicate's machines effects considerable economy in watering, scavenging and upkeep, and, inasmuch as the crust is consolidated by tar penetration, the life period of the road is prolonged.

WILLIAM BOBY.

(Stand 93.)

William Boby's exhibit consists of water-purifying appliances, including their well-known "Simplex" and "Type K" water softeners, filtration plant, and their sterilising system for treating contaminated waters so as to render them suitable for potable purposes. Their water softeners are represented by an example of their patent oscillating automatic water measuring and liquid reagent distributing gear; a lime solution preparing and pumping apparatus, and a complete "Type K" powder reagent machine.

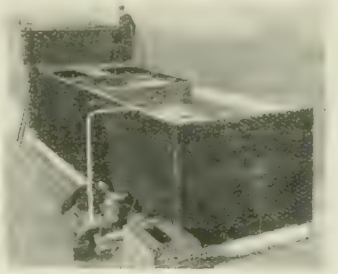


PRESSURE FILTER, WATERWORKS TYPE.

latter being at work. We are informed that a much larger display of their machines was intended, but press of Government orders for their specialities has prevented the possibility of completing any work for the exhibition other than the examples above mentioned.

A handsome model of a waterworks type of pressure filter is shown, also one of their patent distributors for sterilising reagents, the latter being at work. This distributor possesses special interest at the present time from the fact that one of them was in use in Belgium in the Hasselt waterworks up to the outbreak of war, and possibly still remains at work there.

Photographs are exhibited of a neat arrangement of pumping, filtration and purified water storage plant recently supplied by the firm to a Colonial Government Department. There are also numerous photographs and drawings of important installations of softening and purifying plants which have been supplied to municipal bodies, railways, hotels, public and private baths and laundries in various parts of



WATER SOFTENER FOR PUBLIC SUPPLIES.

the Kingdom, the Colonies and the East. There is also a drawing showing the firm's arrangement of bath-water refiltration, embodying a patented form of filter, and several special features which we think will be found of interest to municipal engineers who are contemplating the erection or improvement of public swimming baths.

BIRTLEY IRON COMPANY.

(Stand 16.)

The Birtley Iron Company, Birtley Ironworks, Birtley, Co. Durham, are showing cast-iron pipes for sewerage, gas and water purposes, lamp columns, plain and ornamental fencing, Norton patent surface boxes, manhole, gully, inspection, meter, hydrant [illegible] covers, sluice valve and [illegible]. The special feature of the Norton patent surface boxes, as pointed out in these columns on June 12, 1914, is that their construction permits of broken, smooth or dangerous covers being removed and new ones refixed in a few minutes without disturbance to the frame or roadway or interference with traffic—an arrangement which, as engineers will be quick to realise, makes for very considerable savings in cost of repairs. The boxes, of which there are now over 8,000 in use, are arranged with a specially designed cover with a loose hinge fitted into recesses, which are white metal blocks forming a non-corrodible bearing for the hinge, thus preventing rusting up. There are no bolts or nuts of any description, and the blocks are interchangeable—in fact, simplicity of construction is the keynote of the design throughout—while combining all the advantages of an interchangeable lid, and are fitted with a double hinge which enables them, when open, to lie flat on the roadway. One water company in England spent, between 1902 and 1914, £8,470 for between 9,000 to 10,000 cases, a large proportion of this being made up in the cost of paving, labour, and removal of old cases. In the new system of Norton's patent the whole total cost during these twelve years to this particular water company would have been only £847, which is exactly 10 per cent of the money actually spent during the twelve years.

EDISON ACCUMULATORS, LIMITED.

(Stands 82, 101 & 102.)

An interesting feature of the display arranged by Edison Accumulators, Limited, 2 and 3 Duke-street, Piccadilly, S.W., is their accumulator tipping wagon. The vehicle exhibited is of 2 tons capacity, designed especially for dealing with the removal and collection of house and street refuse, transport of coal and heavy materials generally. It is equipped with an electrically-operated automatic tipping gear, all electric drive and other special features which have gained acceptance by a number of important municipal boards on account of the great simplicity, reliability, economy and durability which the Edison "Electric" system makes available. This wagon can average 40 miles per charge.

SHARP, JONES & CO.

(Stand 91.)

This well-known Parkstone, Dorset, firm are showing their patent rock concrete tubes for sewers and culverts, and patent Aqualite manholes.

HIGHWAYS CONSTRUCTION, LIMITED.

(Stands 31 & 46.)

Highways Construction, Limited, are exhibiting their system of voidless asphalt macadam road construction by means of sections of roads, and an interesting collection of photographic enlargements. Emphasis is laid on the scientific character of the system in the specimens of bitumen, sand and filler carefully proportioned, which are shown in series together with some of the scientific testing apparatus used in the company's laboratories.

The company has recently adopted as a trade mark the word "Monolastic," as it was found desirable to have a term which could be registered in all countries for their system of voidless asphalt macadam roads.

A new brochure, profusely illustrated with photographs of the company's work in all parts of the country, is issued. Attention is drawn to the fact that Monolastic roads have successfully withstood the continuous and heavy rains of the autumn and winter, and the exceptionally heavy military traffic which has been passing over the roads of the country during the past ten months. These two circumstances—namely, the weather and the war traffic—constitute a maximum test for all road systems, and for the Monolastic roads to have emerged so successfully from this test is convincing proof of the efficiency of the system.

It was intended to exhibit one of the company's patent mixing plants—which, by the way, are constructed at their own engineering works—but as all the plants are busily occupied it is not found possible to do this. An enlarged photograph, however, gives a very good idea of the mixing machine used for Monolastic, and the company's officials will gladly arrange for surveyors to inspect such a machine now operating in London.

GIANT'S CAUSEWAY COLUMNAR BASALT COMPANY, LIMITED.

(Stand 2.)

The exhibits of the Giant's Causeway Columnar Basalt Company, Limited, Portrush, consist of columnar basalt hand and machine broken macadam of various gauges, columnar basalt chippings for ferro-concrete, tar-macadam, fine chippings for tar-spraying, artificial paving (either in slabs or situ), concrete tubes, basaltic columns for sea defence works, groynes, sea and dock walling. Columnar basalt is classed among the finest road material known, owing to its great cleanliness, strength and durability. Its crushing strain (Kirkaldy's test) is 52,653 lb. per square inch. Basaltic columns are used as building stone for sea defence works, groynes, dock walling, embankments, and so forth. The company's quarries are situated within easy distance of Portrush, Co. Antrim. New loading bins have been erected at the harbour, Portrush, for quick discharge to steamers.

STOTHERT & PITT, LIMITED; T. L. SMITH & CO.

(Stand 74.)

Messrs. Stothert & Pitt, Limited, 38 Victoria-street, S.W., and T. L. Smith, 13 Victoria-street, S.W., have arranged a joint exhibit of a No. 0 Smith mixer which is capable of mixing tar-macadam or concrete. The machine has an unmixed batch of 8½ cub. ft. It is mounted on skids, and fitted with a feed spout and fast and loose pulleys for belt drive; 4 b.h.p. is required to drive this mixer. The mixer can be fitted with various accessories, particulars of which can be obtained at the stand. The drum of this mixer tilts to discharge, and as it revolves during the operation a very rapid and efficient discharge is obtained. The gearing is placed as far as possible from the points of both feed and discharge, and there is thus practically no possibility of the gearing becoming clogged with the materials being mixed.

GAS LIGHT AND COKE COMPANY.

(Stand 3.)

The above company's exhibit will consist of road-making materials—such as pitch, tar and oils—and they are making a special feature of a new manufacture of theirs—viz., Pitchphalte—which they describe as an excellent material for road grouting, &c. They claim that this article has all the good properties of bitumen, combining great durability with freedom from stickiness under sun heat. It has, they add, the additional advantage that it can be supplied at less than half the cost of bitumen.

WM. WEEKS & SON, LIMITED.

(Stands 96 & 97.)

The exhibits of the firm of Wm. Weekes & Son, Limited, Perseverance Iron Works, Maidstone, will be as follow:—

(1) Patent horse-drawn tar-painting machine, No. 1 P, of 230 gallons capacity, to cover working width of 7 ft.

(2) Hand-power tar-spraying machine, No. 2 H, of 250 gallons capacity, complete with spraying

WEEKS HAND-POWER TAR-SPRAYING MACHINE.

pump, fitted with air scavenging arrangement, crane and pulley blocks for lifting barrel on to boiler.

(3) Hand-power tar-spraying machine, No. 4 H, of 80 gallons capacity, fitted with spraying apparatus and filling pump.

WEEKS PATENT HORSE-DRAWN TAR-PAINTING MACHINE.

(4) Small independent hand-power tar-spraying [illegible] of 35 gallons capacity.

(5) Small portable tar boiler and sand dryer for repairing broken patches in roads.

(6) Direction post with three arms, having raised letters on cast-iron plates (prize winner at 1914 International Road Congress).

H. C. SLINGSBY.

(Stands 79 & 80.)

Patent trucks and ladders of all kinds will be exhibited by the well-known firm of H. C. Slingsby, 142, 144 and 146 Old-street, E.C. This business comprises twelve complete lines—viz.: (1) Slingsby's sliding-wheel patent trucks, known, used and endorsed in all civilised countries; (2) sack trucks, patent "Collron"; (3) handcarts of every description; (4) portable railway material; (5) carrier tricycles; (6) wheelbarrows of all kinds; (7) milk carriages; (8) platform trucks; (9) castors, roller and ball bearing; (10) Slingsby steelback patent extension ladders; (11) Slingsby steelheld extension step-[illegible] (12) [illegible] and [illegible] of any design.

EMBOROUGH STONE COMPANY, LIMITED.

(Stand 23.)

Bituminous macadam for surfacing roadways, bituminous patching for repairing potholes and ruts, and tar paving for footpaths will be brought to the notice of visitors to the Exhibition by the Emborough Stone Company, Limited, Emborough, near Bath.

ENDERBY AND STONEY STANTON GRANITE COMPANY, LIMITED.

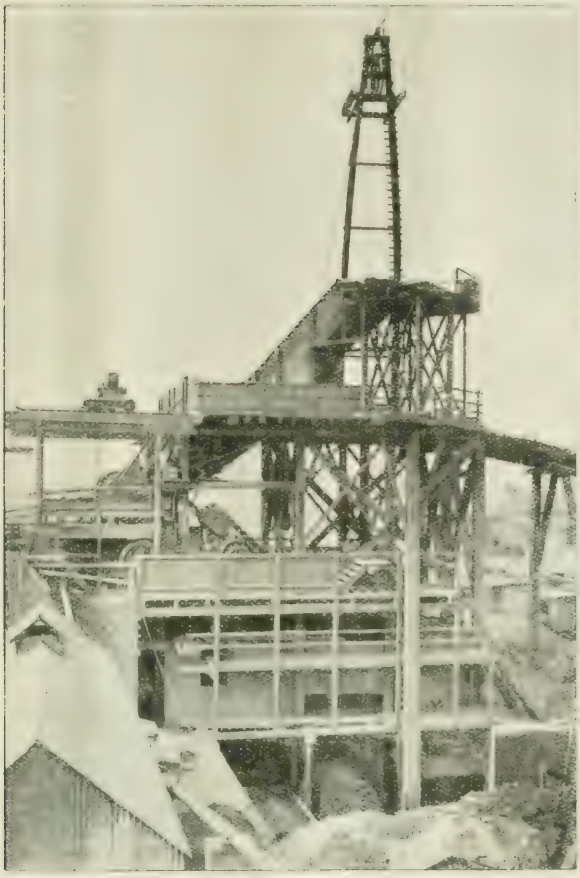
(Stands 36 & 41.)

The Enderby and Stoney Stanton Granite Company, Limited, of Enderby, near Leicester, have set out on Stands 36 and 41 a few of their productions, which help to convey to the observer the varied kinds of stonework they supply. The company work the following quarries in Leicestershire: Sapcote, Granitethorpe, Stoney Stanton, Earl Shilton, Huncote, Narborough, Redhill, Enderby Mill and Enderby Hill; also two in North Wales.

Other exhibits include all kinds of granite setts for tramway work, crossings and general paving the various kinds of broken granite for road making, granite chippings, and screenings for footpaths, concreting work, &c., kerbs and channelling of all sizes, and many other productions too numerous to mention.

They are also licensed producers for the Durax Dustless Roads, Limited, whose widely adopted system of paving for roads subjected to the more intense forms of traffic is the subject of an article which appears on a later page of this supplement.

Before concluding, special attention should be called to the productions of tarred macadam and chippings of different sizes.



Crushing Granite for Macadam. Enderby Quarries.

View of Earl Shilton Quarry.

FERROMAC.

(Stand 18.)

Stand 18 is in the occupation of Mr. R. A. Fraser, Broadway-court, Westminster, S.W., to whom visitors to the exhibition are directed for information regarding Ferromac roads.

Ferromac is a cementitious binder for superseding water-bound macadam roads. It has been used in England and abroad for about seven years, and it is claimed that Ferromac roads have the following advantages over ordinary water-bound: That internal attrition is entirely prevented, the dust nuisance is greatly minimised, the roads are absolutely clean and waterproof, the life of the road is prolonged from 50 per cent to 60 per cent, the surface is non-slippery, and the cost of cleaning and maintenance is much reduced, while the chemical properties of Ferromac do not injure either fish or plant life.

Miles of Ferromac have been laid in the counties of Lincolnshire (Kesteven Division), Huntingdonshire, Bedfordshire, Worcestershire and Wiltshire, and the roads have been most successful, particularly the Fen roads laid in Lincolnshire and Huntingdonshire.

Ferromac roads are also laid with a bitumen surface when the road has to carry extraordinarily heavy traffic, and considerable lengths have been laid at Leyton in Essex, and in Guernsey.

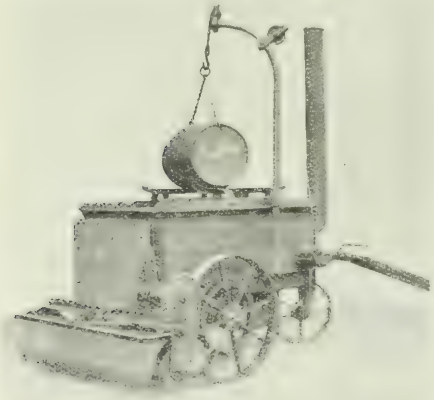
R. S. CLARE & CO., LIMITED.

(Stand 27.)

At this time of financial stringency, which has made itself felt in every branch of commerce and municipal undertaking, the curtailment of expenditure has naturally proved essential, and it speaks well for the sheer merit of the articles that Messrs. R. S. Clare & Co., Limited, of Stanhope-street, Liverpool, supply that an enormous increase of business should have been experienced by this well-known road treatment firm, in spite of the adverse conditions referred to.

It is now, of course, an axiom that materials, of whatsoever nature, which may be destined for use in connection with our military operations in Europe should be of the finest quality procurable, and the War Office have evidently recognised this when ordering, as they have done, a quantity of Tarco for use in France.

One of the results of the national crisis through which we are at present passing is that much of the work which is being done on roads throughout the country this season should take the form of treatment of existing surfaces rather than actual con-



CLARE & CO.'S TAR-SPRAYER.

struction, and this has resulted in a tremendous impetus to the sales of Messrs. Clare's Tarco, the efficiency of which is so well known. A large amount of patching is also being done, and for this class of work Bi-Tarco is a favourite medium, and, on the basis of results obtained, deservedly so.

For the construction of improved tar-macadam, Bi-Tarco, containing as it does a large proportion of pure bitumen and other agglomerating substances, is still the standard binder, and its wonderfully adhesive qualities make it an ideal material in conjunction with granite and similar hard stone.

For those who prefer the grouting method of road construction, a special grade of Bi-Tarco is supplied, and this has yielded exceedingly successful results.

In addition to these road compositions, Messrs. R. S. Clare & Co. are well known in connection with the supply of tar-spraying machinery. The accompanying illustration shows the type of appliance with which this firm have made such a success. The principle governing the working of this is briefly as follows: The hot liquid falls by gravity into a perforated pipe which runs it on to a rotary distributor. The rota is built up of discs and six vanes which revolve at a fair speed, the vanes striking the tar jets as the material is discharged through the perforated pipe, spreading it on the road and giving a perfect distribution.

The advantages that this machine possesses are too numerous to mention in full, but we think the fact that it is foolproof and has no pumps and nozzles or other intricate parts to get out of order will prove a strong recommendation to all users of spraying machines.

These appliances can be supplied in practically any capacity between a small 50-gallon size, to be drawn by hand, which is specially suitable for footpath work, and 1,000-gallon size, to be drawn by tractor; between 160 and 300 gallons capacity these machines are horse-drawn.

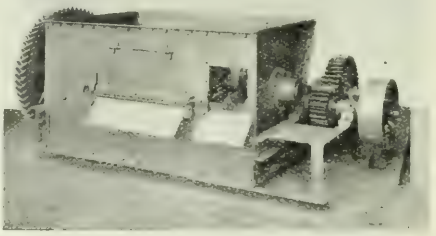
Messrs. R. S. Clare & Co. also supply tar-macadam mixers, of which the adjoining is an illustration. As a matter of fact, this shows an earlier type than the one which is now being supplied, and the present standard model has been improved in respect to the gears, which are now arranged at one end of the plant, the resultant advantages being obvious.

This mixer is essentially one for hard wear, being sound and exceptionally strong; as a matter of fact it weighs between 35 and 40 cwt. It is capable of mixing ½ or 1 ton batches, and its average output may be reckoned at a conservative figure as 50 tons per day, which, however, can be greatly increased, provided conditions of labour and materials are suitable. The shell is built up of mild steel angle plates, channel, &c., with cast-iron curved bottom of specially hardened material made in segments ¾ in. thick. The first drive is of double helical gears 3 in. wide, and the second runs on a 2½-in. mild steel shaft with spur gear and pinion 4½ in. wide. A pulley or chain wheel can be supplied for driving, as preferred. The arms are made of strong cast-iron, with renewable steel blades.

When used for batch mixing the material is fed in at the top, and then mixed, after which the large door at the back is opened, when the machine will then discharge the mixed material into a barrow or cart.

For continuous mixing the material is fed in at the top, at the end farthest from the small door, which is left open; the mixer will then carry the material along and discharge it, when mixed, in a continuous stream through the small door.

Messrs. R. S. Clare & Co., who were the pioneers of road treatment compositions, have not only kept abreast of the competition that has arisen since



CLARE & CO.'S TAR-MACADAM MIXER.

their initial achievements, but have outdistanced many competitors, and are now well in the forefront of this class of business.

We are informed that, owing to the large number of Messrs. Clare's staff who have joined the Forces, and the great pressure of business under which they are working, it has been found impossible to give the necessary time and attention to preparing a series of exhibits such as has always been an interesting feature of this firm's previous appearances at these exhibitions; they have, however, asked us to state that they have reserved an office (No. 27), where their representatives will be very pleased to receive their numerous friends who will be visiting the Exhibition.

CLARMAC ROADS, LIMITED.

(Stand 35.)

Clarmac Roads, Limited, Hallam House, 3 Central-buildings, Westminster, are showing their Clarmac tar slag macadam, also dry slag for concrete or road bottoming, slag chippings for tar-spraying, samples of Clarphalte asphalt carpeting, and raw materials, &c. We are informed by the company that they are supplying Clarmac for the construction of Lordswood-road, Birmingham, St. George's Park-avenue, South-end-on-Sea, and that it is also being supplied for High-street, Coventry, Hearsall-lane, Coventry, several roads in Beckenham, Aldershot, and elsewhere. The company are also at the moment laying Station-road, Aldershot, in Clarphalte.

HILL'S PATENT MOTOR VACUUM ROAD CLEANSER, LIMITED.

(Stand 24 & 25.)

The exhibit of the above firm, which is to be erected on 4 Broad Streetplace, E.C., will be of special interest to municipal engineering visitors to the International Hall. It takes the form of their latest motor cleansing demonstration, of which orders are in hand, have been given, for many towns in London, Manchester, Glasgow, and other districts. The machine consists of four main components, a complete Dingo model chassis, 25 h.p. petrol engine and chain driven, with a capacity of, approximately, 3 tons, placed behind the cab for collecting the sweepings, and a water tank, together with pump and jets for spraying atomised water to the road surface in front of the brush.

The engine develops 45-h.p., and has three speeds forward and one reverse, with direct drive on top gear. The cylindrical revolving brush, the speed of which remains constant, is built up of twenty distinct brushes arranged along the plane of generator surfaces, and can be expanded or contracted, thus regulating the pressure on the road surface or adjusting for wear; this apparatus enables nearly the whole of the bristles to be worn away. The brush, 4 ft. in diameter, sweeps a track 7 ft wide, and, revolving at great speed and in a contrary direction to the road wheels, raises the sweepings and passes them into the receiver behind. The brush can be put out of action or started for working instantly from the driver's seat, and is effectually enclosed on to the road by means of a flexible leather screen.

The water tank is of 100 gallons capacity, and its contents are sprayed by means of a pump and atomising jets to the road directly in front of the brush, and all dust is prevented from rising. The addition of a soluble disinfectant to the water disinfects the road, while the refuse collected can be dealt with in a more hygienic form.

The following are the advantages claimed for the machine: (1) Sweeps and collects from 7-ft. track at one operation; (2) cleanses perfectly every class of road without damage to surface; (3) works close up to the kerb; (4) effects enormous saving in cleansing expenses; (5) work executed under perfect hygienic conditions; (6) working among the traffic the machine can be used day or night without the slightest inconvenience to the public.

STEREOPHAGUS PUMP AND ENGINEERING COMPANY, LIMITED.

(Stand 90.)

The principal item on the stand occupied by the Stereophagus Pump and Engineering Company, Ltd., 39 Victoria-street, S.W., will be a 1½-in. stereophagus pump and electric motor in action. The pump is specially designed for dealing with liquid containing large quantities of solid and fibrous matter without previous screening. Its essential features are that there are no obstructions in the passages traversed by the liquids by which such matters can be arrested, and the working vanes of the impeller are continually scraped by a blade which pushes off or cuts up any matter lodging on their edges.

The pump also contains provision for the taking up of wear, without the renewal of any parts, so as to maintain the original efficiency unimpaired.

The pump is in extensive use for town drainage, sludge pumping and similar duties.

JAMES WM. GLOVER & SONS.

(Stand 98.)

Messrs. Glover & Sons, Warwick, are exhibiting their patent Warwick sprinkler, of which they are the original inventors and sole manufacturers. This van is made to the order of the Hampstead Borough Council, who have large numbers in use. Several improvements have recently been made in the construction of the valve and outlet from tank.

WILLIAM HAYWARD & SONS, LIMITED.

(Stand 66.)

The exhibit of Messrs. William Hayward & Sons, Limited, Brunswick Works and Vulcan Works, Wolverhampton, comprise samples of unclimbable railing, round and square uprights, unclimbable self-adjusting railing, round and square uprights, villa, garden and carriage gates, ornamental wrought-iron entrance gates, and ornamental railing for parks, public buildings and schools.

A. C. WELLS & CO.

(Stands 20 & 25.)

The exhibits of Messrs. A. C. Wells and Co., 102-104 Midland-road, St. Pancras, N.W., will include examples of their road heaters and portable tar boiler —illustrated herewith. For quickly heating tar,

Wells' Portable Tar Boiler

pitch, bitumen, or other mixture in a convenient manner, and without the trouble of a separate tar cart, the portable boiler should be invaluable, since it can be put into a cart with the other tools. The tar is heated by means of a Wells' flare lamp, which

Wells' Road Dryer

is easily removable and can be used separately for lighting if required. The road heating machine is very simple, strong and efficient, and has already been adopted by numerous authorities.

BRITISH REINFORCED CONCRETE ENGINEERING COMPANY, LIMITED.

(Stand 1.)

Among the public authorities which have recently made use of the B.R.C. road facric in road foundations are the county councils of Essex and Antrim, the corporations of Manchester, Leicester, Lincoln, Dublin and Hornsey, the metropolitan boroughs of Bethnal Green and Lewisham, and the urban district councils of Erith, Ilford, Tilbury, Wanstead and Woodford, and a large area of reinforced-concrete roads is under construction for the War Office. The B.R.C. fabric, a sample of which is on view at the company's stand (No. 3), is a mesh of drawn-steel wire, electrically welded at all points where the wires cross one another. It is made in rolls about 7 ft. wide and 240 ft. long, and is easy to handle and simple to instal. A sample of the foundation is also shown, together with photographs of work in progress and work completed in various parts of the country.

Concrete reinforced with B.R.C. fabric is, the company claim, a foundation strong, "live," and resilient, and at the same time economical. The fabric is designed to be easily and rapidly laid in the concrete without special appliances or special supervision, and it so increases the strength of the concrete that a comparatively small thickness is required even for the heaviest traffic. A B.R.C. fabric reinforced foundation spreads each wheel-load over a large area of underbed, and provides even in a new road conditions equal to those that exist in the consolidated foundations of the best and oldest roads. Every type of surface lasts longer, and costs less to maintain on a B.R.C. fabric foundation. The company's offices are at 82 Victoria-street, Westminster.

JAMES OAKES & CO.

(Stand 73.)

Examples of the productions from their iron and tar-macadam and sanitary pipe, glazed brick and tile departments will be shown by Messrs. James Oakes & Co., Alfreton, Derbyshire.

ANGLO-MEXICAN PETROLEUM PRODUCTS COMPANY, LIMITED.

(Stands 43, 44 & 45.)

Prominent among exhibits of road materials at the Horticultural Hall is that of the Anglo-Mexican Petroleum Products Company, Limited, of Finsbury-court, London, E.C., who are showing their well-known Mexican bitumens, Mexphalte and Fluxphalte.

Mexphalte is a high-grade bitumen, 100 per cent pure, of great toughness and extreme ductility. It is specially refined from vast natural supplies in Mexico. It has exceptional cementing qualities, as is demonstrated both by laboratory tests and practical service in roads all over the country. Its value for grouting work and for asphalt-macadam is established, and it is being used with all the leading types of mixing plant. Roads constructed with Mexphalte are claimed to be dustless, silent and sanitary, as well as waterproof and wear-resisting under the heaviest traffic.

Fluxphalte is a more liquid bitumen containing 60 per cent solid, specially refined for spraying roads. The dressing is applied hot by a pressure-spraying machine, and is an easy and effective method of giving a dustless asphaltic surface to an ordinary macadam road. It may be mentioned that there is no tar or by-product of tar in Fluxphalte.

These materials are now so well known to surveyors that little more needs to be said about them beyond remarking that the company is maintaining the uniform high-grade character of these products, and the work of the past season has still further demonstrated their suitability for road work in this country.

The exhibit comprises specimens and samples of Mexphalte and Fluxphalte reinforced by an excellent series of photographs showing their application both in this country and abroad. Among the literature being distributed is the third edition of the company's attractive booklet, "Twentieth Century Roads," which is a record of the constant progress made in the use of the above materials in all parts of the kingdom.

LOCH FYNE GRANITE QUARRIES, LIMITED.

(Stand 12.)

The exhibit of this firm consists of three nidged setts, 6 in. by 6 in. to 11 in.; two nidged setts, 4 in. by 6 in.; two ordinary setts, 4 in. by 6 in.; two ordinary setts, 3½ in. by 6 in.; two ordinary setts, 4 in. by 7 in.; two pegtops, 4 in. by 4 in. by 6 in.; two cubes, 4 in. by 4 in. by 4 in.; and ½ cwt. macadam and chippings, ½ in. by ¾ in.

Special attention may be drawn to the company's nidged sett paving exhibit, as this paving is devised to suit the most exacting requirements of modern traffic, and has the combined advantages of being as noiseless as wood paving, more durable, cheaper, and is non-slippery, which is essential for a successful city paving.

Their macadam, as exhibited, is perfectly screened, cubicle, and, the firm claim, stands the highest crushing strain of all Scotch granites, as per Messrs. Kirkaldy's test, showing a resisting strain of 44,661 lb. to the square inch.

Their granite chippings exhibited, ½-in. and ¾-in. sizes, are specially screened, and have been highly recommended for all grouting, tar-spraying, ferro and reinforced concrete work, being absolutely free from dust and all foreign matter. The firm are confident that this material will give satisfaction in any market, as their Grarae plant has been extended for this purpose by the introduction of Hadfield's latest type of disc crushers.

"KYL-FYRE," LIMITED.

(Stand 24.)

"Kyl-Fyre," Limited, 12 Elms-buildings, Eastbourne, have a display of their extinguishers, of which over 1,500,000 are stated to be now in use. "Kyl-Fyre" is a dry powder, and is contained in a cylindrical tube, 20 in. long by 2¾ in. diameter, and weighs 6 lb. At the top of the tube is attached a strong loop from which it is suspended by a strong hook. In case of an outbreak of fire a person merely takes a firm grip of the tube and pulls down (thus leaving cap on hook), and throws the contents with force into the base of the flames. The result is instant extinction of the flames. When the powder strikes heat it immediately generates a powerful, but harmless, gas, which, by displacing the oxygen in the air, must extinguish the flames. The hotter the outbreak the greater the effect. It contains no grit and no acids.

TARMAC, LIMITED.

(Stands 8, 9 & 10.)

The exhibit of Tarmac, Limited, Ettingshall, Wolverhampton, and 20 Victoria-street, Westminster, will include samples of the specially selected blast furnace slag—lump and broken—from which their widely-used material is made, and samples of Tarmac as prepared ready for laying; photographs of the company's Wolverhampton works, of the trial sections of Tarmac laid in connection with the Road Board trials at Sidcup and Wandsworth, and of Tarmac roads in Gloucestershire, Warwickshire, Lancashire, Nottinghamshire, Worcester, Berkshire, and elsewhere. In some notes on their material the company say: "The suitability of blast furnace slag of the right sort for the manufacture of tar-macadam has been amply proved under actual test. Examination of our samples of untreated slag will demonstrate that the slag used by the company has an exceptionally rough and uneven surface, which means that it possesses the maximum 'holding power' for the mixture used for coating. It is porous enough to perfectly retain and hold the mixture, and is at the same time as strong as the best classes of granite and similar materials."

The company have a fully equipped tar-distillation plant at their works, and the tar compound used for coating is distilled and prepared to physical and chemical standards known to give the best results as regards strength of binding properties, freedom from tendency to affectation by atmospheric variations, and length of life as an effective bind.

Tarmac is made in three gauges—2½-in. (2½ in. down to 1½ in.), 1½-in. (1½ in. down to ¼ in.), ⅜-in. (⅜ in. down to ⅛ in.)—and is recommended for the construction of dustless, mudless and durable roads and carriageways, footpaths, carriage-drives and school playgrounds.

Large extensions to both the company's existing works have been recently completed, but such is the demand that they have proved inadequate. New works are now in course of erection at Brymbo, near Wrexham, and at Middlesbrough.

ROBEY & CO., LIMITED.

(Stand 62.)

This well-known Lincoln firm had intended making a large display of their road rollers, road locomotives, &c., but, owing to the extensive demands made by the Government on their manufacturing facilities for the production of munitions, it was found impossible to complete their exhibit.

They therefore show one of their new design 5-ton steam wagons, which is meeting with an increased demand. Many advantages are claimed for this wagon, chief among which is the Belpaire type of boiler, in which, owing to the absence of roof bars, circulation of water is not impeded, which tends towards economy,

5-ton "Robey" Steam Wagon.

and gives greater accessibility for cleaning. A greater heating surface is obtained, due to the larger tube plate, and a large steam space is secured without curtailing the depth of water on firebox top. The engine is of the compound overtype pattern, cylinders being bolted to steel seatings riveted to boiler. Superheated steam is used, and a feed water heater is provided, giving economy in fuel and water consumption.

A compound tractor is also exhibited. This is built on precisely the same lines as their well-known road locomotives, and comes within the allowable limit of weight. It is fitted with specially large cylinders, and patent spring gear adjustment to hind axle. These engines are readily convertible to rollers, and a number have been supplied to urban district councils.

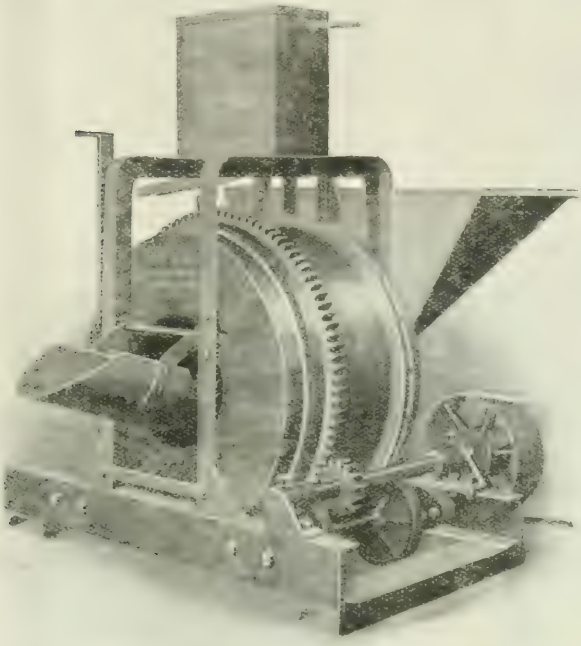
Messrs. Robey & Co. are also manufacturers of stone-crushing plants, portable engines, &c.

RANSOME-VERMEHR MACHINERY COMPANY, LIMITED.

(Stands 68 & 92.)

The main feature of this exhibit is a concrete mixer known as the "I.M.P." machine, which has been designed by the company to meet the requirements of engineers and contractors carrying out small work, where initial outlay on a mixer is an important item.

The machine exhibited is of the No. 0 size, having an approximate batch capacity of 5 cub. ft. of mixed concrete, the average output being 60 cub. yds. per day of ten hours, and the maximum output 120 cub. yds. per day of ten hours.



"I.M.P." CONCRETE MIXER.

The mixer is fitted with a feed chute, adjustable water tank, and fast and loose pulleys. It is of very strong construction throughout, and is, of course, backed by the "Ransome" guarantee. The price will be found to compare favourably with any other concrete mixer of sound make at present on the British market. The machine is manufactured by Messrs. Ransomes & Rapier, Limited, of Ipswich, and prompt deliveries can be given.

The company are also exhibiting several lengths of their Ransome Type D steel piling, cut from actual piles. Illustrated herewith is a series of cofferdams constructed of this section, which will eventually extend over a length of 1¼ miles. The particular cofferdams illustrated were used by the contractors for laying an outfall sewer for the Belfast Corporation.

The Ransome section has also been employed in very large quantities on the Port of London extensions, the Rosyth naval base, Kingston Bridge widening, &c.

Particular attention is drawn to the trough shape of the section, which gives it maximum strength with minimum weight, and also the oval surface of the interlock, which obviates any possibility of jamming, and allows the section to be withdrawn and re-used many times. When in position the piling is perfectly watertight, without any necessity for caulking or the use of clay puddle.

Although the company are not, on this occasion, exhibiting their stone dryers and tar-macadam mixers, water filters, or pile extractors, it may be of some interest to indicate that the first-mentioned have been adopted by many leading surveyors in the country, including Mr. A. Dryland, the county surveyor of Surrey; Mr. J. A. Crowther, the borough surveyor of Southampton; Mr. J. E. Swindlehurst, the city engineer of Coventry; the Southport Corporation; the Devonport Corporation; and such well-known private firms as the Limmer Asphalte Paving Company, Ltd., and Claridge's Patent Asphalte Company, Ltd.

An installation of water filters is at the present moment being completed for the Merthyr Tydfil Corporation to treat 1,200,000 gallons per day of twenty-four hours, and the company are also executing an extremely large contract for the Toronto Corporation, the quantity of water to be treated being 60,000,000 gals. per day. The pile extractors have been largely employed for withdrawing steel, timber, and reinforced-concrete piles, and among users may be mentioned the Clyde Navigation; the North-Eastern Railway; the Taff Vale Railway; Messrs. S. Pearson & Son, Ltd.; Topham, Jones & Railton, Ltd.; Easton, Gibb & Son, Ltd.; Perry & Co. (Bow), Ltd.; Dick, Kerr & Co., Ltd.; Holloway Bros. (London), Limited, and Jackaman & Son.

JOHNSTON BROTHERS.

(Stands 106 & 107.

In addition to their patent double-furnace tar-boilers, Smart's Midget tar-boiler and appliances for road patching, Waithman's reservoir tar-brooms, road signs, tar-trollies, Archer's brooms and tar-brushes, Messrs. Johnston Brothers, 79 Mark-lane, E.C., are

COFFERDAMS CONSTRUCTED WITH RANSOME TYPE D STEEL PILING.

exhibiting various road materials—quartzite, granites, tar-macadam and slag.

TRINIDAD LAKE ASPHALT PAVING COMPANY, LIMITED.

(Stands 15 & 30.)

Samples of Trinidad Lake asphalt, both in its raw state and after being submitted to the process of rolling, will be among the exhibits of the Trinidad Lake Asphalt Paving Company, Limited, Britannia Wharf, Townmead-road, Fulham, S.W. The firm's asphalt pavements are now to be found in all parts of the country. One of the chief features of the process is the elimination of a Portland cement concrete foundation, usually associated with asphalt pavements. Samples are shown of the composition as laid in various thicknesses. The following are the specifications in most frequent use: (1) For roadways of light traffic, 1½ in. to 2 in. Trinidad asphalt macadam is laid upon the existing macadam roadway; (2) for roadways of medium traffic, 2½ in. to 3 in. of Trinidad asphalt macadam is laid upon the existing macadam, or if there is not room for the new pavement without excavating, the surplus material is removed, and, after the base has been formed to required levels, and consolidated with a heavy roller, the new pavement is laid to the thickness specified; (3) for roadways carrying motor-'bus and similar heavy traffic, 3in. asphaltic concrete and 1½ in. Trinidad Lake asphalt wearing surface (this is the specification adopted upon the Victoria Embankment); the foundation of the roadway is prepared as described under specification 2, and the new pavement, consisting of 3 in. of asphaltic concrete and 1½ in. Trinidad Lake asphalt wearing surface, is put down in two layers. The firm's exhibits will include special machinery for drying, heating, grading and mixing coarse and fine aggregate with bitumen in road construction work. Photographs will illustrate roadways laid with Trinidad Lake asphalt in various parts of the United Kingdom, and of the paving plant used for the manufacture of the material. Another feature of the display will be the firm's mastic asphalt for roofs, floors and dampcourses.

PRUFIT.

(Stand 69.)

Messrs. Rogers, Welch & Co., Limited, of 26 Page-street, Westminster, are showing some exhibits of cement work waterproofed with Prufit.

This enterprising firm stepped in at the outbreak of war last August, and procured a licence from H.M. Board of Trade to use the patent under which Ceresit was made. They are calling their manufacture Prufit.

Messrs. Rogers, Welch & Co., Limited, claim that Prufit has merits which no other waterproofers possess. These merits may be summed up as simplicity, safety in use, and economy in cost. People who used Ceresit in the past will need no convincing of this, and others should make a point of calling at the stand and examining the claims of this waterproofer for themselves.

Messrs. Rogers, Welch & Co. have made arrangements for marketing Prufit, not only in all British Dominions, but in various foreign countries. We wish this laudable endeavour to capture German trade for British industry every success.

GENERAL VEHICLE COMPANY, LIMITED.

(Stands 108 & 109.)

The General Vehicle Company, Limited, Imperial House, Kingsway, will exhibit one of their 3½-ton chassis, which, it may be added, will be fitted with a Warwick street watering sprinkling arrangement. The battery fitted has a 268-ampere-hour capacity. The firm have sold a similar vehicle to the one to be exhibited to the Ipswich Corporation, the vehicle being equipped to take an interchangeable dust-collecting tipping body and street-watering tank.

MIDDLESBROUGH SLAG COMPANY, LIMITED.

(Stand 38.)

Samples of blast furnace slag and tar-macadam comprise the exhibits of the Middlesbrough Slag Company, Limited, Tees Bridge Slag Works, Stockton-on-Tees.

MERRYWEATHER & SONS, LIMITED.

(Stand 105.)

The famous Greenwich firm will be showing their vacuum apparatus for emptying cesspools and gully-holes, a vacuum cylinder van of 350-gallons capacity, and a portable petrol vacuum pump, among other things.

CROSS & CROSS, LIMITED.

(Stand 86.)

At Stand 86 Messrs. Cross & Cross, Limited, Union Works, Walsall, exhibit various types of motor warning and speed limit signals, either for fixing direct in the ground or to any convenient wall. The warning plates are of malleable iron and are unbreakable as may be seen from a bent sample exhibited—and the hollow triangles are cut from the solid mild steel plate.

The warning notice, "Road under repair," illustrated herewith, is of steel throughout, the plate being

enamelled with 4-in. white letters on a red ground. These can be supplied with any other inscription that may be found necessary.

The firm also exhibit samples of malleable-iron letters for fixing to existing wooden direction-posts in place of the usual painting. These have the great advantage of being permanently legible. Messrs. Cross & Cross are also makers of steel-framed buildings, roof trusses, and constructional steelwork for all purposes.

ROCMAC, LIMITED.

(Stands 19 & 26.)

The firm of Rocmac, Limited, 13 Victoria-street, S.W., are in occupation of Stands 19 and 26. Rocmac is a waterproof binder for macadam which has admittedly stood the test of time.

Among the claims made for it are that it can be laid in any weather, that it affords a good foothold to horses in any weather or on any gradient, and that it binds granite as well as tar or bituminous binders bind softer or more porous materials.

The firm state that it is unaffected by weather or any climatic changes. The Rocmac binder is a silico-saccharate-carbonate, and is formed by the combination of Rocmac solution with carbonate of lime. First cost is not excessive, as a general rule, Rocmac costs in Great Britain 20 to 40 per cent more than a water-bound macadam road laid with the same aggregate. Finally, to quote the makers, "Rocmac at least doubles or trebles the life of the aggregate bound with it. Rocmac can be repaired as easily as a water-bound road, and its cost in maintenance is very low. Rocmac roads have been laid by hundreds of local authorities in Great Britain."

ELECTRIC HOSE AND RUBBER COMPANY, LIMITED.

(Stand 89.)

The above firm, who carry on business at Caxton House, Westminster, are specialists in the manufacture for garden, industrial and mechanical purposes, and have arranged a comprehensive display of their productions. Municipal engineers will, perhaps, be more particularly interested in their heavy delivery suction, steam and pneumatic hose. They will also be showing their "R.F.C." rubber-filled and covered belting.

BRISTOWE & CO., LIMITED.

(Stand 42.)

Messrs. Bristowe & Co., Limited, 11 Tothill-street, Westminster, are showing, at Stand 42, Tarvia in its varying grades—A grade for Tarviated macadam and constructional work, B grade for surface treatment, Grout grade and Tarvia pitch for grouting Durax paving or other similar work. Samples of Tarviated granite of varying grades and gauges will also be exhibited, and an object of especial interest will be a section of road laid for the Penge Urban District Council in 1913.

As is well known, the Cantar hand-spraying machine is a specialty of the firm. The type illustrated [illegible] with a horse-drawn (No. 2) machine, [illegible] of 160 gallons, and is capable of supplying [illegible] Tarvia or tar compound, heated to a temperature of 200 deg. Fahr., to spray 5,000 super. yds. of road surface per day, provided the fire has proper attention. The spraying apparatus is likewise adapted to deal with this quantity in an ordinary working day, and is fitted with pump, filter, thermometer, pressure gauge (to ensure the same quantity being applied throughout), hose carrier, 16 ft. of flexible hose, in [illegible]

No. 2 Cantar Hand-spraying Machine

with four jets. The apparatus is designed to enable the Tarvia or tar compound to be drawn from the boiler past the thermometer, and returned; this enables the exact temperature to be taken before commencing work. A hot-air supply is also fixed to the pump to ensure the whole of the tubes and vessels being well heated before allowing the tar to pass through them, and also to enable the whole fittings being well cleaned and blown out after working. The machine is fitted with a strong hoisting jib, complete with sling block and chain, for putting barrels in position.

The firm also manufacture a hand-drawn machine (No. 1), with a capacity of 75 gallons, this having fittings similar to the horse-drawn apparatus, with the exception of the hoisting jib. This machine is recommended for pathwork and small repairs, as its construction permits of its being easily moved about.

Fibrastic tramway rail and engine bed packing, and non-set plastic cement, are exhibited at the same stand by Messrs. Robbins & Co., 11 Tothill-street, Westminster. The Fibrastic packing has been successfully tried on a large number of tramway systems in different parts of the United Kingdom. It is claimed to be entirely waterproof, and immovable under traffic. Various sections and photographs illustrating work done are shown. Robbins' non-set plastic cement is a well-known medium for sealing cable boxes, manhole covers, and so forth.

IRONITE COMPANY, LIMITED.

(Stand 13.)

At Stand 13 the Ironite Company, Limited, of 1 Victoria-street, S.W., have arranged various interesting exhibits of building materials waterproofed with Ironite, also samples of their patent flooring process.

Ironite is a fine mineral powder which, simply mixed with water, enters into the voids of concrete, brickwork, woodwork, and other similar porous substances, and by oxidation and expansion forms, it is claimed, both a mechanical and chemical union, and becomes an inseparable part and parcel of same. In this process a substance is formed that is practically indestructible and impervious to water, air, heat, colds, oils, acids, alkalies, &c.

Ironite is applied either to a wet or dry surface and to a structure in course of erection, or to one many years old. It can be applied either internally or externally, and against any degree of water pressure. It is entirely free from any oil, paraffin, bitumen or similar substance, and permanently renders dampproof or waterproof any cellars, vaults, tunnels, basements, walls, reservoirs, baths, pits, roofs, [illegible] claimed to make a perfect dampcourse, and forms an ideal bond for cracks and leaks in brickwork and cement.

Ironite flooring is designed to be mixed dry with cement and crushed granite, or sand for the floor topping. In the process of setting, by reason of the chemical action which takes place, the particles of Ironite flooring not only expand and tightly seal the pores and interstices, but also bond the surrounding particles in a much firmer adhesion than is ordinarily obtained with Portland cement alone. This manner of topping produces a floor that, in addition to being absolutely impenetrable and non-absorbent, is as near to being wearproof as it is possible to make it. Such a floor, the company contend, will resist almost any crush-power and tensile strain.

METAL JOINTING COMPANY, LIMITED.

(Stand 70.)

The exhibit of the Metal Jointing Company, Limited, 11 Adam-street, Strand, W.C., will comprise various specimens of the Amalgaline system of jointing lead, as applied to general plumbing work (water services and sanitary pipes). The firm have also included samples of lead-lined iron pipes for sanitary work, which form the subject of a patent recently granted them, and which supplies a demand which, up to the outbreak of the war, was, the company state, entirely in the hands of the Germans. Further, they will show the best method of dealing with copper-lined lead pipes for hot-water work.

THE LIMMER ASPHALTE PAVING COMPANY, LIMITED.

(Stand 39.)

Prominent among the exhibitors are the Limmer Asphalte Paving Company, Limited, of Caxton House, Westminster, S.W., who have arranged an interesting display of specimens of mineral rock asphalte as taken from the company's freehold mines, Bassin de Seyssel (Haute Savoie), France, and mineral rock mastic asphalte (manufactured from the above mineral rock) and of the rock reduced to powder. Samples of refined Trinidad bitumen and Bridport grit, Lithofalt paving blocks in various thicknesses with plain and grooved surfaces, and Lithomac asphalt-macadam, suitable for county

(10,000 yds. super.)

roads and all carriageways bearing fast motor traffic [illegible] pavements of compressed asphalte paving as taken from the carriageway of Victoria-street, originally laid 2 in. thick, in 1897, compressed and relaid 2 in. thick, in 1900, taken from the carriageway of Holborn Viaduct, originally laid 2½ in. thick, in 1900, laid to falls, [illegible] and re-laid in Northumberland-street, Pop[illegible] in Victoria-street, 1908, and Limmer asphalt paving blocks, originally laid in Bow Common-lane, 2 in., in March, 1910. Samples of Bitumen bituminous specialities, including paints, varnishes and damp-proofing compositions are also exhibited, and there will also be exhibited photographs illustrative of work done in roofs, flooring, street paving, &c., and others showing the [illegible] of the Barnard de Segard.

Reproduced herewith are views of the Staines (main) road on which the firm's Lithomac asphaltic [illegible] and of the Crystal Palace Parade, where an [illegible] has been laid to the [illegible] Canberra. Briefly [illegible] the [illegible] material has been laid 4 in. in thickness on existing [illegible], to receive [illegible] and [illegible] 2½ in. thickness, and composed of 2-in. to ¾-in. stone (with a [illegible] and [illegible] [illegible] and [illegible] [illegible] and [illegible] [illegible] [illegible]

CONSTABLE, HART & CO., LIMITED.

Slag tar-macadam, as made under modern methods by the principal firms, is now recognised universally as an eminently suitable material for road surfacing. Among its many good points are its adaptability - being supplied for laying down ease of laying - although this should be done by expert layers—uniformly good results, economy in maintenance, low cost, cleanliness and durability compared with water-bound surfaces, and the good foothold it gives to horses.

Among the principal firms producing this material to-day are the well-known house of Constable, Hart & Co., Limited, of 41 Eastcheap, London, who have large works at Wellingborough, Islip and Wednesbury, a photograph of the last of which we are enabled to reproduce on this page. These works were only erected recently, at a large cost, to enable the firm to deal with the ever-increasing demand for their materials. At these Wednesbury works, which we had the pleasure of visiting some months ago, the firm have embodied all the latest improvements, resulting from their experiences at their older works, both in the manufacture and reduced cost of production.

Constable, Hart & Co.'s Slag Tar-macadam Works at Wednesbury.

Messrs. Constable, Hart & Co., although one of the oldest firms in the tarred stone trade at Matlock and elsewhere, only took up the manufacture of slag tar-macadam about ten years ago, since when they have produced material equivalent to over 3,000,000 sq. yds. of work, which has been laid on many important roads both in London and provincial towns, as well as on many of the principal county roads. One of the most important thoroughfares in London, Portland-place, Marylebone, with heavy traffic, was laid with this firm's material five years ago, and is now in perfect condition. They also laid two of the trial sections at Sidcup (9 and 10), and these are still in perfect condition. Innumerable other examples of the success of this firm's material could be given if space permitted, and we can strongly recommend surveyors and others to get into touch with them when contemplating the resurfacing of their roads.

A Glossary of Road Terms (By H. Percy Boulnois, M.Inst.C.E., St. Bride's Press, Limited, 24 Bride-lane, E.C., Price 2s. nett).—The movement towards standardising the principal roads throughout the United Kingdom has rendered it necessary to correlate the nomenclature of road terms in use in different districts, and Mr. Boulnois has compiled a glossary with the hope that it may form a basis for such a correlation.—*Times Engineering Supplement.*

ROAD MAINTENANCE DIFFICULTIES.

THE EFFICACY OF TAR TREATMENT.

In a special report on the work of tar-spraying the borough surveyor of Chippenham, Mr. A. H. Lapham, said he thought the council should honour the difficulties attending the work of road upkeep at the present time. In the first place the delivery of stone was stopped from several quarries unless it was required for military purposes, and, secondly, it was difficult to get hauling done, while at the same time labour was becoming scarcer. Up to the present he had made considerable progress with the tarring of the roads, and good results had been obtained. A tar sprinkler purchased by the council in 1913 was capable of treating upwards of a mile of road per day. Without the use of such a machine the tarring would last most of the summer, whereas now, with favourable weather—although commenced later than usual—the tarring of the roads in that district should be completed within three weeks.

There were many difficulties connected with the use of tar which the average person knew nothing about—such as weather conditions, the nature of the road, the quality of the tar, and the driers—all being important factors in the ultimate result. His conclusions, however, were that, apart from its value as a dust preventive and a healthful deodoriser, tar improved the surface of the road for all traffic, and was worth more than its cost as a material for road maintenance by reason of increasing the life of the road.

He had ventured to offer these remarks so that if the owner of a vehicle did pick up a few splashes of tar he might remember, when slight inconvenience was suffered on one journey, the many and permanent advantages which followed.

Waterproofing.—The following report from the engineer of one of our largest boroughs will be of interest. The heating chambers and underground coal-storing places of a school built about eight years ago were continually flooded—so much so that the boilers were destroyed. The engineer at first thought he would have to fill in the chambers because the water was made so rapidly, but decided, as a final resort, to make a new waterproofed concrete wall, and to give the wall a waterproofed cement rendering. The result was excellent. New boilers were put in, and the whole of the underground chambers are now dry. The work was done last September, and has stood the heavy rains of the past winter. The engineer states that he is now specifying Pudlo (the waterproofer used on the above work) for a heating chamber to a santorium.

BRISCOE'S PATENT MANHOLE COVER.

Practice with the times is shown at the introduction by a municipal engineer of an entirely new design in manhole-cover frames embracing principles which can be applied to any surface-pit cover frame, gully tops, and so forth.

There are quite a number of novelties attached to the design that may prove interesting to the municipal and county engineer and surveyor, who has continually to contend with the little irritating imperfections which are frequently found to accompany the use of such articles.

From a pamphlet before us entitled "A Word about Manhole and the like Surface-pit Cover Frames, by A. H. Hall, M. and C.E. and M.R.San.I. and Pub.," it would seem that the patentee has taken into consideration every known defect arising in the ordinary cover frames, and, determining their causes,

has avoided these, producing a cheap cover frame which, from an engineering point of view, should give perfect satisfaction.

The differences between this cover frame and others might be summarised as follows:—

(*a*) While other cover frames consist usually of a vertical wall or side with a bearing flange at or level with its lower edge, all bedded above the masonry of the surface pit or manhole, this new frame has a horizontal flange introduced between the lower edge and the top, which forms an additional bearing for the cover frame. The bed for this additional bearing reinforces the vertical wall or side of the frame. The introduced flange is so shaped that it not only provides the additional bearing for the cover frame, but it also reinforces the road surface abutting against the frame, so that there is always a cushion of road material against the frame, absolutely preventing the presentation of any sharp edges to the traffic, and affording a perfectly easy transmission of loads over the cover.

(*b*) The double seatings of the cover in the frame are treated in such a novel fashion that it would appear almost impossible for the cover to rock in its frame, as is so often the case with manhole covers. The lower seating is corrugated, so that, while there is a good bearing, no ledge is left on which stones or dirt may lodge, a common cause of covers rocking. The upper seating on the frame consists of a conical or knife edge, upon which the flat face of the upper bearing of the cover rests—a principle intended to ensure that the cover will be self-adjusting in its frame.

The bricklayers state that the cover is much more easily handled and fixed than the ordinary cover.

It is claimed that, while in as simple manner as possible attaining all the objects for which patent covers have been introduced in recent years, this cover frame is designed to do more, inasmuch as the necessary bed for the new position of the bearing flange protects and strengthens or reinforces the walls of the cover frame, and the design of the flange is such that it is at once self-evident that it marries and maintains the road material surrounding the frame to the frame, and so reinforces the road surface surrounding the frame.

A notable advantage which this cover frame appears to present is obtained by taking into consideration what doubtless hitherto custom has left to the workmen—that is, the fact that when a surface pit is constructed, the construction space behind the walls of the surface pit has to be filled in, which, if with ordinary filling, however thoroughly punned, will always be more or less subject to settlement. Such settlement naturally causes a depression at the surface of the roadway, and tends to drag the road material away from the manhole-cover frame, exposing the iron face of the walls of the cover frame to the oncoming traffic.

The new cover frame has dealt with this matter so that the depression at the surface of the roadway cannot take place against the cover frame, as is possible in all cases hitherto presented, but the possible depression is removed to a distance from it, always leaving a cushion of road material around the frame to protect it.

We quote from the pamphlet referred to respecting the new position of the flange:—

The dip of the flange is such that the traffic always rolls on to its face and never against it. The innovation is that the flange of the cover frame is placed at the surface level, and is so rounded and pointed that it at once

(1) Presents an inclined plane or a very flat curved surface to the traffic, avoiding all danger from sharp edges and giving an easy run on to the cover.

(2) The road material against the frame is reinforced by passing into or through the flange holes or pockets, so that all tendency of the road material to slide or crush away from the frame is eliminated.

(3) The road surface cannot wear down below the surface of the flange, because the flange carries the loads and prevents it.

(4) The raised bed for this flange supports the road material surrounding the cover frame, and always preserves a cushion of road material around the [illegible] which

ordinarily takes place. Hitherto this has never been efficiently accomplished.

(5) The flange resting upon the new bed transmits the loads directly to the walls of the manhole, and thus protects the main walls or body of the frame.

(6) The grouted raised bed reinforces the frame, and prevents fractures from loads striking laterally, as is apt to occur with ordinary frames.

(7) The cover cannot tilt or rock in its frame, as no dirt or stones can lodge upon its seatings, and it is self-adjusting.

(8) The joint between the cover and frame is protected from dirt, and therefore the cover is always easily lifted.

(9) Paving not being required effects a saving of 14s. to £1 per cover, as a set-off against any extra cost of cover.

(10) In solid covers grease may be put in the groove at the upper seating, and thus secure that the covers are perfectly sealed and airtight.

(11) Where it is necessary to prevent any surface water entering the manhole through the joint between the cover and frame, drainage holes are provided above the upper seating of the frame to carry off all surface water that may find its way into that joint, thus making an ideal cover for dry manholes or surface pits.

(12) A cover frame to meet present-day traffic, avoiding danger to quick-speed vehicles, giving an easy passage over the cover, with its metal distributed to prevent fractures from increased and

heavier traffic, and in every respect a cover to meet future needs.

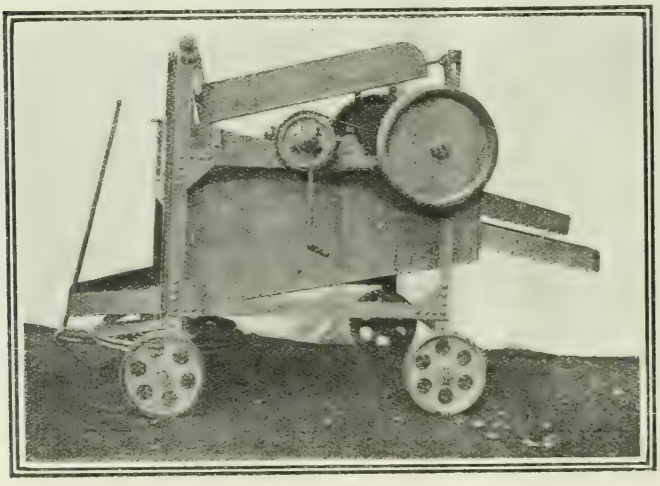
This cover and frame may be had of various designs, or the same principle may be applied to any engineer's specially designed cover upon application.

It may often be observed that in composite roads having part sett paved and part macadam, the macadam abutting upon the paving is quickly worn into holes, evidently through the wheels of heavy traffic suddenly passing from the harder on to the softer material; especially is this the case when the surface water does not freely run away from the meeting edge at the junction of such materials. The application of the patent edging prevents the disastrous effect of the sudden passage of the wheels from the harder on to the softer material by reinforcing the softer material at the junction with the harder, and gradually uniting one with the other.

Further particulars and prices can be obtained from the sole makers, W. E. Horsman & Son (over thirty years with G. Waller & Son), sanitary engineers, 127 Pendle-road, Streatham, London, S.W.

"MULTI-RAPID" SCREENING MACHINE.

The machine illustrated herewith is capable of screening 25 to 125 yds. of material per day, according to which hand or mechanical power is used. It will screen three grades at once, and is suitable for



The Multi-Rapid Screening Machine

sand and gravel pits, brickfields, destructor works, gasworks, and should be found invaluable by road contractors. Messrs. W. E. Horsman & Son, 127 Pendle-road, Streatham, S.W., are the sole makers.

To Manufacturers.—Mr. William H. Eley, engineer and surveyor to the Newmarket Urban District Council, writes: I shall be glad to know through the kindness of your columns of any makers of steam or motor wagons for removal of house refuse, street watering, or general haulage of road materials.

Labourers' Cottages in Ireland.—The Chief Secretary for Ireland was asked in the House of Commons, on the 10th inst., whether, in view of the difficulty during the period of the war of procuring a sufficient sum of money from the Treasury to finance in whole pending schemes for the building of labourers' cottages in Ireland, the portion of the schemes dealing with applicants whose present houses had been condemned as insanitary and unfit for human habitation would be proceeded with. Mr. Birrell said the reply was in the affirmative; but it would be necessary for the rural district council in each case to satisfy fully the Local Government Board that the occupants of such dwellings could not be otherwise provided for before this portion of the scheme could be authorised to be proceeded with.

MEXPHALTE—CLINKER ROADS.

At the stands of Highways Construction, Limited, and Anglo-Mexican Petroleum Products Company, Limited, at the National Road Exhibition, surveyors will have an opportunity of inspecting samples cut from roads composed of clinker dust and Mexphalte laid by Mr. E. J. Lovegrove, the borough surveyor of Hornsey.

The notices which have already appeared regarding this new process have aroused considerable interest. The clinker—as described in last week's Surveyor—is from the borough council's dust destructor, and, without sorting or selection, is pulverised in a lightning crusher yielding a mineral aggregate ranging from ¾ in. to a fine impalpable powder equal in fineness to cement. This material appears to have a natural affinity for Mexican bitumen, with which it forms a tough, homogeneous and resilient compound admirably adapted for carpeting worn macadam roads. The bitumen used is the well-known brand Mexphalte, and the material was mixed in a portable mixing plant loaned by Highways Construction, Limited.

Specimens of road and graded samples of the clinker dust are exhibited at the stands of the companies referred to, where further information and printed matter relating to this process can be obtained.

Dunfermline Waterworks.—The Dunfermline District Committee have reached a settlement for the purchase of land at Glendevon for the erection of the reservoir and other works. The purchase money, which amounts to £10,515, was fixed by valuation.

Coast Sand Dunes (By Gerald O. Case, St. Bride's Press, Limited, 24 Bride-lane, E.C., price 5s.).—The rapid increase of sand wastes around our coasts is indeed a serious one, and Mr. Case has done a valuable work in the writing of this book.—*Southport Guardian.*

The Civic Engineer's Who's Who, compiled by the editor of The Surveyor and Municipal and County Engineer, for a second annual issue is remarkably complete. The biographical matter is full and methodically arranged. The book is published by the St. Bride's Press, Ltd. —*Liverpool Courier.*

Society of Engineers.—On June 17th members of the Society of Engineers and their friends visited the works of the Edison & Swan Electric Light Company, Limited, at Ponders End, Middlesex. The visitors had as their principal object an insight into the process of "Royal Ediswan" electric lamp manufacture, but they also had an opportunity of visiting the engineering section where every department was working "to deliver the goods" such as switches, switchboards, instruments, and other electrical accessories required for Government use; extra hands and extended workshops have enabled the additional output to go ahead with very little interruption of their usual trade.

Property Owners and Sanitary Reform.—A discussion took place at a recent meeting of Oakengates Urban District Council on the excuses put forward by some property owners for not carrying out very necessary sanitary reforms when ordered to do so by the council. Mr. G. Davies remarked that if, owing to the war, they must hold their hands in the matter of sanitary reform, it would be as well to obtain the consent of the Local Government Board to dispense with the services of the medical officer of health and sanitary inspector. The sewerage scheme had been carried out at great expense, and property owners must connect their property with the sewers. Other councillors agreed with the observations of Mr. Davies, and the council's officers were instructed to see that the necessary work was done.

further, that the commencement that has been made in applying the powers lying to their hand will be exercised with the greatest possible vigour in rectifying, as far as possible, the blunders of the past in securing proper roads and streets in connection with all present-day schemes, and in providing that future ratepayers will be spared the expense of undoing work which ought not to have been done, and will look back upon the labours of town planners of the present generation with approval, and, it may be, gratitude and admiration.

CONGESTED AREAS.

Scotland possesses, in common with England, her full share of natural beauty, but she has as well many ill-designed and unwholesome areas. Somewhat that progress is being made by the town authorities of Scotland in the improvement or obliteration of these black spots. Progress may be slow, but, nevertheless, excellent work is being done.

In all old towns this problem arises, and, in my opinion, any scheme for the planning or replanning of a town is incomplete if it does not include the reconstruction and improvement of its congested areas and the widening of narrow traffic streets, as well as the lay-out of unbuilt-on land.

THE DUNDEE SCHEME.

In support of this view I might here appropriately explain the policy in the reconstructing and town planning of Dundee. The proposals, to be complete, are necessarily comprehensive, and in Dundee we have taken the precaution to look well ahead. They embrace

(1) A scheme of widening all existing and forming all new main traffic roads;
(2) A scheme of widening all narrow subsidiary roads;
(3) The removal or improvement of congested areas;
(4) The allocation of land for industrial and residential purposes;
(5) A scheme of parks and open spaces;
(6) The extension of existing and the construction of new tramways in new residential areas;
(7) The lay-out of all unbuilt-on land within and in the immediate neighbourhood of the city boundaries; and
(8) The provision of a civic centre.

The time at our disposal is not sufficient to allow me to enter into the details of these proposals, and it may be sufficient if I state generally—

(1) That, with regard to roads, plans of main traffic roads were prepared some years prior to the passing of the Act of 1909, providing for the widening of these up to the city boundaries, and, where widening was prohibitive, for the construction of new main traffic roads through unbuilt-on land, and that plans of narrow subsidiary roads were also prepared in which buildings were shown to be pulled down for the purposes of widening as opportunity arose;

(2) That, in attacking the housing problem, Dundee will operate in two ways—in the closing of insanitary dwellings on the one hand, and, on the other, in the acquiring of agricultural land at low rates within and beyond the city boundaries for the purposes of housing;

(3) That negotiations have already been in progress for the purchase of agricultural land, and we are hopeful that these negotiations will result in the purchase of land suitable for dwelling-houses which will enable owners of cottages to acquire building lots at an annual feu duty or ground rent of 20s. per house where there are ten houses to the acre, and where twelve or more houses to the acre, at a proportionally less sum per house;

(4) That tramway extensions and new public parks have been laid down for various localities;

(5) That one scheme for the removal and improvement of two congested areas is now in course of being carried out, the expenditure in connection with which, including the erection of new buildings, will exceed £1,000,000; and

(6) That the provision of a civic centre worthy of the city has been included in a comprehensive plan of the improvement of the central area of the city, and this scheme is best explained by the drawings which I now submit to the meeting.

I must apologise for having referred with a certain amount of fullness to what is being, and is proposed to be, done in Dundee, but as it is the scheme of town planning with which, naturally, I am best informed, I could speak of it with more authority than of any other scheme, of which there are many in course of preparation in Scotland.

The cities of Edinburgh, Glasgow and Dunfermline are engaged in schemes which will provide outstanding examples of town planning, and the county of Lanark is occupied with complex and important schemes, while the lead that is being given by the larger authorities is being followed, and will be further taken up by the smaller burghs.

These necessarily brief observations do not by any means give our English friends anything like a fair representation of the large amount of good work being done in the North, but it is hoped they are sufficient to indicate that local authorities and their officials in Scotland are sincere and earnest in their desire to make the fullest possible use of the powers conferred by the Act, and if the results are to be measured by consistent hard work and enthusiasm, and a determination to put an end to haphazard methods of lay-out, overcrowding, and jerry-building, then there need be no fear for the future of "town planning in Scotland."

Increase in Potteries Gas Charges.—Increased prices for gas in the Potteries towns supplied by municipal works are recommended by the Gas Committee of Stoke-on-Trent Federated Council. Advances of 6d. per 1,000 cubic feet, to 2s. 4d., are recommended at Burslem, Longton, and Fenton, and an advance of 7d. per 1,000, to 2s. 7d., at Stoke.

Ballinrobe Water Supply.—The Local Government Board have intimated to the Ballinrobe District Council that, owing to the restrictions put upon the borrowing of money by the Lords of his Majesty's Treasury, they were not prepared to sanction the loan of £3,600 applied for towards the improved water supply for the town, and suggested that the scheme should be left over till the termination of the war. The scheme had already been approved of, and the area of charge fixed.

The Suffering Roads.—The need for economy in road maintenance having been urged by members of the Dulverton Rural District Council, the surveyor, Mr. E. Groves, advised the council not to neglect their main roads on any account, otherwise they would find their grant adversely affected. Discretion should also be exercised lest the council, in trying to save a sovereign, found themselves called upon to pay a "fiver" for the repair of the same piece of road next year. After further discussion, the council asked the surveyor to use his discretion in the matter, suggesting that rigid economy be practised wherever possible.

Assistants' and Students' Section.

CONDUCTED BY SYDNEY G. TURNER, ASSOC.M.INST.C.E.

All communications in regard to this page must be addressed to The Editor, St. Bride's House, 24 Bride-lane, Fleet-street, E.C. *Envelopes must be marked "Assistants' Section" in the top left-hand corner. Correspondents are invited to submit questions for consideration and answers to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.*

QUESTIONS.

This week answers are invited to the following questions:—

485. Building Construction. A casement window-frame is to be fixed in a cavity wall (10-in. stone facing, an inner facing of bricks, and a 2-in. cavity). Show clearly the methods of fixing, and any important features with respect to the relation between the window-frame and the cavity. (Mercian.)

487. Structures.—Find, graphically or analytically, the maximum deflection in a steel lattice girder of the N type, supported at each end, under a load of W tons applied on the bottom boom at a distance of 24 ft. from one support. Span of girder, 72 ft.; six 12-ft. bays; depth of girder 10 ft. Take safe intensity of stress in the members as 5 tons per square inch, and Young's modulus E=13,000 tons per square inch. There is no counter-bracing. Neglect the weight of the girder itself. (B. K., *Newport.*)

489. Road Making.—What is the best material from which to make paving setts for use in a carriage-way of steep gradients? Give reasons.

490. Hydraulics.—Find the ratio which must exist between the breadth and depth of water flowing in an open channel of rectangular cross-section, in order that the velocity of flow may be at its maximum. (N. W. K., *Bury St. Edmunds.*)

491. Books on Bridge Design.—Please give the name of a thoroughly practical book or books on the design of modern highway bridges. The book or books required must deal with the practical design rather than an abundance of theoretical calculation, and must be up to date. ("Tico.")

[The Editor is at all times glad to hear from readers who desire to submit questions regarding matters of general interest, points of daily practice, &c., for insertion in the "Assistants' and Students' Section." Questions which are published are taken into consideration, as well as other matter, in awarding the Monthly Premium.]

REPLIES TO QUESTIONS.

486. Sewage Ejectors.—How would you test the efficiency of a pair of 100-gallon alternating sewage ejectors with motor-driven air compressors? (C. A. B.)

Suppose the pressure of the air as it enters one of the ejectors is p lb. per square inch. Now a pressure of 14·7 lb. per square inch is equivalent to a head of 34 ft. of water. Therefore a pressure of p lb. per square inch is equivalent to a head of $\frac{34}{14·7} p = 2·3p$ ft.

Then, if w_1 is the weight in lb. of 1 cub. ft. of water,

Work done per cubic foot of water = work put in = $2·3 p w_1$ ft.-lb.

Also, if w_2 is the weight in lb. of 1 cub. ft. of sewage, and h is the vertical distance in feet that sewage is raised,

Work done per cubic foot of sewage = work got out = $h w_2$ ft.-lb.

$$\therefore \text{Efficiency} = \frac{\text{work got out}}{\text{work put in}} = \frac{h w_2}{2·3 p w_1},$$

neglecting a certain amount of kinetic energy which the sewage would possess when discharged from the rising main.

Take a numerical example. Find the efficiency of a 100-gallon ejector raising sewage weighing 65 lb. per cubic foot, the lift being 45 ft. and the air pressure at inlet valve 30 lb. per square inch. Weight of 1 cub. ft. of water = 62½ lb.

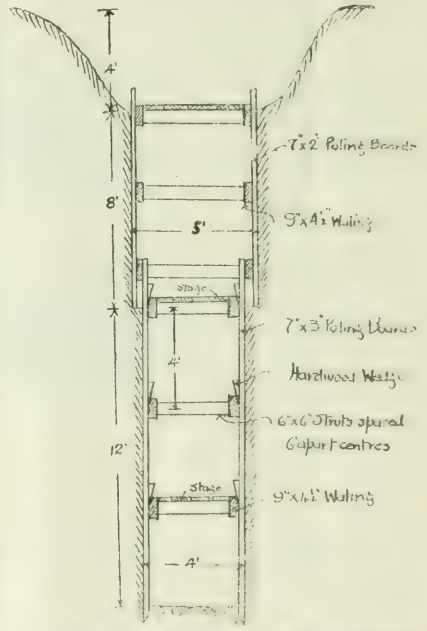
$$\text{Efficiency} = \frac{\text{work got out}}{\text{work put in}} = \frac{65 \cdot 45}{2·3 \cdot 30 \cdot 62·5} = 0·408.$$

The total lift can be obtained easily enough, but if the rising main is of considerable length, a correction must be made in the calculation for head lost due to friction in the main. The discharge in gallons for a given period can be found, and, the length and diameter of the rising main being known, the head lost from this cause could be allowed for, and added to the total lift.

For the work put in it will be necessary to obtain the pressure of the air just before entering the ejector. It is assumed in this answer that it is the efficiency of the ejector only, not that of the air compressor, that is required. Each ejector should be tested quite separately from the other, and care should be taken that the air pressure remains constant during the entire test. (B. K., *Newport.*)

488. Timbering.—Describe and illustrate by a cross-section the timbering of a trench in bad ground 24 ft. deep and 4 ft. wide.

The method illustrated is much used for soft and waterlogged ground. The excavation is carried down without any timbering for about the first 4 ft. and let come to the angle of repose of the earth. The next section for about 8 ft. is excavated and supported by upright sheeting waled and strutted. The excavation is continued by lining the trench with a second continuous system of poling boards pointed at the end. These are waled and strutted as shown. Between each poling board and waling



a hard wood wedge is inserted. The method of proceeding with the excavation is as follows: The wedges securing one poling board are loosened, and the earth from round the foot removed for a depth of about 12 in., the poling board is then dropped or driven as the earth is removed and re-wedged. Each successive poling board is similiarly dealt with until the whole length has been lowered to the necessary depth. Struts and walings are added as the poling boards descend. If running sand is met with, it is important that the feet of the poling boards should be kept in the ground, as if any of the vertical side is exposed the sand is liable to ooze out and leave the poling boards unsupported, and probably cause the whole system to collapse. If the trench follows the line of a road or street, it would be better to timber the trench from the ground level, as more space would be left for traffic. (J. G. W., *Downpatrick.*)

Institution of Water Engineers.

SUMMER MEETING IN LONDON.

The summer meeting of the Institution of Water Engineers was held on Friday last at Burlington House. Mr. T. Molyneux presided at the earlier part of the proceedings, and after his installation as president, Mr. F. W. McCullough (Belfast) took the chair. The attendance included Messrs. J. C. Barrowclough (Batley), A. B. E. Blackburn (Sunderland), W. J. E. Binnie (Westminster), F. H. Brunt (Rochdale), W. T. Burgess (London), R. C. F. Busfield (Fareham), I. Carr (Widnes), J. Chisholm (Airdrie), W. Clemence (London), C. Clemesha-Smith (Wakefield), A. H. Cooper (Wey Valley), A. E. Cornewall Walker (Redhill), F. W. Davies (Nottingham), F. I. Dixon (Ashton-under-Lyne), J. T. Edwards (Leicester), Percy Griffith (Westminster), H. C. Head (Winchester), W. R. Jenkins (London), Baldwin Latham (London), H. Lapworth (Westminster), Wm. Matthews (Westminster), F. W. McCullough (Belfast), T. Molyneux (Stockport), C. B. Newton (Hull), H. Preston (Grantham), C. H. Priestley (Cardiff), R. B. Rigby (Bury), C. H. Roberts (Aberdeen), E. Sandeman (Westminster), J. Ward (Derby), and W. Whitaker (Croydon) — members; H. Blakemore (London), H. Dewey (London), A. E. Drown (Westminster), J. E. Edmondson (London), D. Kirk (Coatbridge)— visitors.

Mr. P. Griffith, secretary, read the minutes of the nineteenth general winter meeting, which were confirmed.

NEW MEMBERS.

The Chairman announced that the following candidates had been elected since the winter general meeting held on December 11, 1914:—

As Members: Messrs. H. J. Rofe, Westminster; and W. A. Walker, engineer and manager, Higham and Hundred of Hoo Water Company.

As Associate Members: Messrs. G. A. Ballard, assistant borough engineer, Guildford; J. H. Bird, waterworks manager, Neath; W. J. Goode, engineer and surveyor, Buckfastleigh; N. Platt, assistant waterworks engineer, Wakefield; S. Reason, late assistant engineer, water department, Antofagasta and Bolivia Railway Company, Chile; W. Thompson, corporation water engineer, Bridlington; and T. Nicholas Young, waterworks engineer and manager, Epsom.

Transferred from Associate Member to Member: Mr. R. J. Hartley, waterworks engineer, Halifax.

INSTALLATION OF PRESIDENT.

Mr. MOLYNEUX: Mr. F. W. McCullough, Justice of the Peace for the city of Belfast, member of the Institution of Civil Engineers, and water engineer to the Belfast Water Trust, was elected unanimously by you at the winter meeting to be president of this institution for the year 1915-16, and he needs no words of commendation from me in formally introducing him to you. I feel I am voicing the sentiments of you all when I say that, while we welcome him heartily on his own behalf, we have a particular thought of him as the representative of the Sister Isle. We all regret the fact that we are installing him here in London instead of among his own people, so that we could have shown them how high he stands in our regard and esteem, but we hope that by next summer better times will have arrived, and that we shall then have the opportunity which we lack to-day. Mr. McCullough was one of the first members of the association in 1896, he has been a member of the council since 1910, and, notwithstanding the handicap of a sea voyage, has been most assiduous in his attendance; his advice and counsel have always been most valuable. I tender him on your behalf his certificate of office, with the hope that he may have good health and enjoy the ensuing as I have done the past year, and I can assure him that he will have the hearty support of one and all.

The PRESIDENT: My first duty as your new president is to propose that a hearty vote of thanks be given to our immediate past-president, Mr. Molyneux, for the very dignified and successful manner with which he has filled the position of your president in the past year. Mr. Molyneux has given the greatest satisfaction to all the members, and has specially endeared himself to every member of the council by his courtesy and energy, and the active way in which he has dealt with all matters brought before the institution during the past year. He has fulfilled his anticipations, and with, as the latter has a larger membership this year than when he took office, and, if possible, it stands in a higher position as an institution. I ask members to pass the vote with acclamation.

The proposition having been adopted,

Mr. MOLYNEUX said: I thank you, Mr. President, for the kind words you have used in proposing the vote of thanks to me—I only hope I have deserved them—and you, gentlemen, for the way in which you have received it. My year of office commenced, I venture to think, auspiciously at Stockport in June last, but the awful unforeseen events which have happened since have, I am afraid, rather made our thoughts wander from the work which this and kindred institutions are doing, and the suspense and anxiety which some, if not all, of us have experienced, and are experiencing, somewhat militates against concentration on anything more than work which is absolutely necessary for the well-being of our fellows. I have enjoyed the work during my term of office, and, like all my predecessors, cannot retire without expressing appreciation of the valuable services our secretary renders, which are, I think, particularly patent to the president. With regard to the members of the council, I thank them for the support they have given me in the council meetings, and, gentlemen, you may rest assured that, while they support the president, the work they do is not done with that unanimity which so often means indifference, but with that healthy criticism which has the interests of the institution at heart.

WORK OF THE INSTITUTION.

The PRESIDENT afterwards delivered an address—from which we make some extracts—on the work of the institution during the past year. He had, he said, to thank the council for his nomination, and the members of the institution for his election as their president for the coming year. He appreciated this honour very highly, probably more so than any of his predecessors, because, although he had been a member from the establishment of the "Association" in the year 1896, he was one of a very limited number hailing from Ireland, and therefore his selection to fill the highest position they could offer was, to him, a valued compliment, and he willingly accepted the many responsibilities of the office in the hope that, with the full sympathy and ready assistance of every member, he should be enabled to continue the good work and extend the usefulness of the institution during the coming year. The work of the institution was by no means limited to the proceedings at their general meetings, and their progress was clearly indicated by the membership roll during the past three years. [This shows an increase from 401 to 428.] The increases were not large, but a glance at the list of members would show that, in securing the support of men who truly represented the water engineers both of the present and of the future, the institution was steadily advancing in the right direction.

Mr. McCullough proceeded: During the past year the council have had under consideration many matters of importance both to our profession and to the authorities we serve. Among these may be mentioned the assessment of water undertakings for income-tax. Although the council were advised that it was not worth while for the institution to intervene for the purpose of securing an allowance for depreciation in *all* such assessments, members are advised that the decision arrived at by no means precludes them from applying individually for such allowances. The fact that the matter could not be taken up on behalf of water authorities generally must not be assumed as implying that the claim is untenable in all cases.

The question of standardising contract clauses for the use of water engineers, referred some time back to a committee of the council, has now been definitely advanced by the preparation of a draft set of model clauses which will shortly be discussed by the committee, and which will probably form the basis of a report to the council. It is therefore to be hoped that this important matter will be brought before the members during the ensuing year.

The council are also considering the possibility of remodelling the standard clauses defining the term

"domestic supply" and regulating the charges for water supplied for purposes "other than domestic." The question is one of considerable complexity, and the existing standard clauses are of great antiquity, so that it will not be easy to suggest what action should be taken; but the council are considering the question on broad lines, with a view, first, to avoid litigation or disputes between water authorities and consumers; and, secondly, to protect the interests of both water authorities and consumers, and no action will be taken unless these results may reasonably be attained thereby.

In conclusion, I may be permitted to express the regrets of the Lord Mayor of Belfast, and of my chairman and the members of the Belfast Water Trust, that the unforeseen circumstances created by the war have necessitated the postponement of the summer meeting in Belfast, and I hope that the cessation of hostilities, and the settlement of the European crisis to the full satisfaction of Great Britain and her gallant allies, will permit the members of the institution to visit Belfast at no very distant date.

(To be continued.)

TOWN PLANNING INSTITUTE.

ANNUAL MEETING.

Mr. Raymond Unwin occupied the chair at the annual meeting of the Town Planning Institute on Wednesday afternoon. The proceedings, which took place at the Surveyors' Institution, were attended by, among others, Messrs. G. L. Pepler (Local Government Board); H. E. Stilgoe, city engineer of Birmingham; J. W. Cockrill, borough engineer of Great Yarmouth; W. Harpur, city engineer of Cardiff; W. T. Lancashire, city engineer of Leeds; W. L. Carr, engineer and surveyor to the Ruislip-Northwood Urban District Council; E. Willis, engineer and surveyor to the Chiswick Urban District Council; J. A. Webb, engineer and surveyor to the Hendon Rural District Council; J. Thomson, city engineer of Dundee; W. R. Davidge, district surveyor for Lewisham; and A. R. Potter (secretary).

In an account of the work of the institute presented by the chairman, it was mentioned that the membership roll had been increased by ten members, sixteen associate-members, one legal member, three legal associate-members, six associates, and two honorary members—thirty-eight in all. The policy of uniting in the institute members of the professions connected with town planning was stated to have been amply justified by the very great interest and value of having each point of view represented in the discussions. It had also the advantage of providing a wide choice of subjects on which attention could be concentrated. It was added that it was proposed during the coming session seriously to consider the question of instituting an examination on town planning as an avenue for membership.

A paper on "Town Planning in Scotland," which was afterwards read by Mr. Jas. Thomson, the city engineer of Dundee, is reproduced on another page of this issue.

Axle Weights.—The Friary, Holroyd and Healey's Brewery, Limited, Guildford, were summoned before the Surrey County Bench on June 16th for causing to be used at Spa Bottom, Esher, on June 2nd, a heavy motor-car, the back axle weight of which exceeded the registered weight.—Mr. C. B. Watson, solicitor, from the clerk's department of the Surrey County Council, said that the case was similar to one which had been dealt with a few days previously. He had then pointed out that great damage was done to the Surrey roads by the heavy motor traffic, and until the overloading of these vehicles was stopped the roads in Surrey would never get a chance. Evidence was given by Frederick V. Chalker, clerk in the surveyor's department, that he weighed the defendant company's petrol lorry on the county council's weighbridge at Spa Bottom, and found the back axle weight to be 6 tons 18 cwt. 2 qrs. 14 lb. The registered weight was 6 tons. The load consisted of barrels and crates of beer. A representative of the company said he could not dispute the figures, but he pointed out that the total load was not excessive, as the front axle weight was only 2 tons 8 cwt. Mr. Watson: You are only summoned in regard to an offence with the back axle. The chairman, in fining the defendants 40s. and £2 2s. costs, said that it was the load on the rear axle which did the damage to the roads.

THINGS ONE WOULD LIKE TO KNOW.

(Contributed.)

Wouldn't a "pronouncement" as to the effect of tarring flint roads be very useful to road engineers at the present time? Was it not very interesting to note recently the statement of Mr. Heslop, the county surveyor of Norfolk, that he had to sweep the dust and grit back on to his flint roads during dry weather in order to preserve them? But could not this be followed up by him with some information as to whether tarring the surfaces would not be equally efficient, and, in the long run, more economical, and also prevent the dust rising, as it is said to do, in large clouds in these districts where the roads are thus treated with dust?

* * * *

Is not the failure of the sewage farm at Stafford properly to treat the sewage—as stated at the recent Local Government Board inquiry—an object lesson to those engineers and others who still raise the cry of "the sewage back to the land"? Is it not a fact that there are now but very few successful broad irrigation sewage farms left in this country, and that these are only where the land happens to be of excessive porosity, and exactly suitable for the purpose of purifying sewage? Does not the ever-increasing addition of trade wastes to our sewage make the problem of proper purification more and more difficult?

* * * *

Is it not rather interesting to follow the "history" of municipal engineering during the last fifty years? Has there not been a succession of subjects in somewhat the following order—sewerage, sewage disposal, housing of the working classes, electrification of tramways, small holdings, roads, town planning? What will be the next subject that will exercise our minds? May it not possibly be in the direction of increased traffic, at greater speeds and weights, and a complete revolution in the present methods of construction of our roads and streets?

* * * *

Shall we not hail with pleasure Mr. Lovegrove's recent investigations into the construction of a bituminous road carpet made with clinker from a refuse destructor? If this experiment is successful, will it not lead to a useful application of a waste material—the residue of another waste material—which hitherto has only been sparingly used in the manufacture of mortar and concrete, whereas, if it is successful in the direction of Mr. Lovegrove's experiments, will it not solve many of the problems connected with its disposal, and eventually lead to a very cheap form of road-surface construction? Will it not be possible also to construct an entire road, from foundation to surface, of this clinker, and thus solve the problem of a reliable, resilient, rutless road?

* * * *

Has not the Labour Bureau scheme rather failed to come up to expectations? Do we not hear on all sides of persons who require labour of various descriptions being unable to obtain it on application at the bureaux? Cannot something be done to make the department of real practical use, instead of confining its benefits, as seems to be the case at present, to those employed by the Government to administer it?

* * * *

Why is it that the Orphan Fund of the Institution of Municipal and County Engineers is not more generally supported by the members of the institution? Is it not to be regretted that for the past year the subscriptions realised only £132 12s. 6d. from 1,769 members, and that, were it not for the generous support given to the fund by men who have retired from municipal service, and by other "outsiders," the subscriptions would be quite insignificant? What can be done to stimulate interest in this fund? Do the majority of members of the institution really realise the great benefits of such a fund, and how largely these benefits might be extended if the fund were more worthily supported?

Destructor Clinker Roads.—Surveyors will be interested to know that the pulverising of the destructor clinker employed by Mr. E. J. Lovegrove in the construction of these roads at Hornsey is effected by one of the machines of the Patent Lightning Crusher Company, Limited, 14A Rosebery-avenue, E.C.

Municipal Work in Progress and Projected.

The Editor invites the co-operation of SURVEYOR *readers with a view to making information given under this head as complete and accurate as possible.*

The following are among the more important projected works of which particulars appear below:—Buildings—Hessle, Oswestry, West Sussex, Worcestershire; housing and town planning—Middlesbrough; roads and materials—Aylesbury, Bermondsey, Devon, [illegible], St. Helens; water, gas and electricity—Axminster, Salford. Particulars of other projected works will be found on page [illegible] Local Government Board Inquiries [illegible].

BUILDINGS.

Arbroath T.C.—The burgh surveyor, Mr. P. C. Smith, has received instructions to prepare an estimate of the cost of a hospital for the treatment of tuberculosis.

Dundee T.C.—The Public Health Committee recommend the town council to provide [illegible] for the treatment of measles at the King's Cross Hospital.

Hebburn U.D.C.—The council have decided to erect six public conveniences.

Hove T.C.—Plans have been prepared for a cookery and domestic subjects centre at Connaught-road school at an estimated cost of £1,200.

Oswestry T.C.—The council have decided to oppose a scheme proposed by the Salop County Council for the erection, at a cost of £20,000 [illegible] hospital to serve eight urban and rural districts in North-West Shropshire.

Shipston-on-Stour R.D.C.—The surveyor, Mr. C. J. Gander, has received instructions to prepare alternative plans for building under Shipston bridge or rebuilding the structure as a girder bridge.

Surrey C.C.—The Highways and Bridges Committee report the practical completion of the strengthening of the old part of Cobham Bridge and the works in connection with the widening of the bridge.

Wellingborough U.D.C.—Provision has been made in the estimates for the construction of underground lavatories at a cost of £1,000.

West Sussex C.C.—It is intended to build a school at Crawley, at an estimated cost of £4,945, and a school at Horsham, at an estimated cost of £5,408.

Worcestershire C.C.—It has been decided to build a new school at Malvern, at an estimated cost of £4,679.

HOUSING AND TOWN PLANNING.

Brighton T.C.—A satisfactory report was presented last week on the finances of the working-class dwellings. The Health Committee have discharged over £1,000 of the debt on the buildings, although there was a deficit of £200. The interest and loan charges for the year were over £2,000, of which it was estimated that about half was capital and half interest.

Longbenton U.D.C.—The Local Government Board have authorised the council to prepare a town planning scheme.

Middlesbrough T.C.—The Streets and Plans Committee have approved generally the alternative scheme of the borough engineer, Mr. S. E. Burgess, for laying out the Saltwells estate, and have appointed a committee to confer with the landowners on the subject.

Selby U.D.C.—A site has been purchased in Flaxley road for the erection of industrial dwellings.

REFUSE COLLECTION AND DISPOSAL.

Beckenham U.D.C.—The surveyor, Mr. J. A. Angell, presented a report on the disposal of the destructor clinker, advising that the manufacture of tar-macadam therefrom should be discontinued for the present, and that such of the material as was not sold should be utilised for making up the roads on the allotments at an estimated cost of £150 for cartage and labour. The council agreed to adopt the proposal.

Grimsby T.C.—The Household Scavenging Committee at its last meeting decided to purchase, and accepted a tender for, an up-to-date covered four-wheeled tip wagon for the collection of house refuse.

Itchen U.D.C.—The Roads Committee have been authorised to carry out the removal of house refuse in certain districts by direct labour after the existing contracts expire.

ROADS AND MATERIALS.

Aylesbury R.D.C.—The Road Board have sanctioned a scheme of road repair at Halton, at an estimated cost of £2,241.

Bermondsey B.C.—The quotation of the borough engineer and surveyor, Mr. R. J. Angel, at £1,500, has been accepted for paving works in Tower Bridge-road.

Brighton T.C.—It has been agreed to purchase the forecourt of 39 Dyke-road and a strip of land at the rear of the premises in Prestonville-road for the purpose of street improvements.

Devon C.C.—In a report presented at this week's meeting, the Bridges, Main Roads and County Buildings Committee reported that in accordance with the instruction of the council to hire plant in preference to purchasing it in any case where the available terms of hiring were reasonable, they invited fresh tenders, but these were so high that it was resolved to purchase for use on the main roads in Division 1 a steam traction engine, a Baxter stone-crusher, two tipping wagons, and a water-cart, and, for the Exeter to Okehampton main road, two steam tractors and four trailer wagons; also roller wheels and appliances in order that the traction engine might be used as a steam roller, the total cost being £2,362.

Dunfermline T.C.—A draft agreement with the Earl of [illegible] has been approved [illegible] to [illegible] Victoria Road.

Egham U.D.C.—Plans have been approved for making up Park-avenue and South-avenue.

Haddington T.C.—Various road repairs are to be carried out, at an estimated cost of £120.

Kidderminster R.D.C.—It has been agreed to carry out an improvement on the road from Barnett Hill to [illegible], at an estimated cost of £140.

Linlithgowshire C.C.—In reference to the recent suggestion of the Road Board that, where possible, all schemes involving large sums of expenditure should be deferred for the present, it was stated at the Bathgate District Committee meeting that there had been further correspondence with the board on the subject. The district committee had written to say that they could not accede to the suggestion in certain cases, as the work had already been commenced. The chairman, Mr. W. Cuthbertson, pointed out that they had schemes in hand where the work had been started last year, and a good deal of money already spent on them. The Bathgate District Committee had applied for sanction to a loan of £1,800 for the purpose of improving the Bathgate and Airdrie and Bathgate and Blackburn roads. The Standing Joint Committee had intimated that, unless the works in question were actually necessary, they would not sanction a loan. After considerable discussion, the feeling of the meeting was to take the necessary steps to satisfy the Standing Joint Committee that the work for which the money was required was an actual necessity.

Mytholmroyd U.D.C.—A letter has been received from the Local Government Board sanctioning the payment of reasonable expenses incurred by the surveyor, Mr. S. Sutcliffe, in attending the Road Conference in London, and intimating that such sanction could not extend to any other delegate.

Nuneaton T.C.—The Estates Committee recommend that the footpaths of Riversley Park should be tar-sprayed, at an estimated cost of £50.

Paddington B.C.—It has been decided to carry out paving works at Woodfield-road wharf, at an estimated cost of £150.

Pontardawe R.D.C.—A letter was received recently from the Glamorgan County Council in regard to a suggestion made to them some time ago as to the tar-macadamising of some of the county roads in the neighbourhood of Pontardawe. The letter stated that a comprehensive scheme for coating a large number of main roads in the Swansea division, including

Pontardawe, had been prepared and approved by the county. It had now been sent to the Road Board. The scheme was still under the consideration of the Road Board, and they were apparently disinclined to make any grants towards such schemes in the present state of public affairs. The county surveyor hoped, however, to be able to secure a grant later on.

Stanley (Durham) U.D.C.—The surveyor, Mr. A. Routledge, has received instructions to carry out an experimental scheme of tar-spraying.

Westminster T.C.—The Finance Committee of the London County Council have sanctioned a loan to the city council of £50,000 in respect of the council's contribution towards the cost of the Thames-embankment extension and other street improvements.

Wincanton R.D.C.—The attention of the council having been drawn to the possible danger to fish life in the river Brue by a proposal to carry out tar-spraying at Bruton, it has been decided to meet the wishes of the residents of the district to tar-spray the roads if they agreed to give the district council an indemnity to pay one-half of any future expense involved in the operations. The mover of the proposition said that personally he thought the risk was nominal.

Worcestershire C.C.—It has been agreed to reduce the estimates of road expenditure by £5,000.

SEWERAGE AND SEWAGE DISPOSAL.

Chertsey R.D.C. The Local Government Board have written that they had had under consideration the report made by their inspector, Mr. Tulloch, on the application of the council for sanction to borrow £1,947 for the enlargement of the pumping station at Byfleet, and the provision of new machinery. In ordinary circumstances the board would have sanctioned the loan, but they were now only sanctioning loans for new expenditure in cases which were a pressing necessity either for reasons of public health or on account of war requirements. They were unable to sanction the loan at the present time. The board also referred to the council's letter asking for the borrowing of a further sum of £347 for works of surface-water drainage for the parish of Byfleet, and requested that the board might be furnished with certain particulars on an enclosed form. The council decided to supply the information asked for.

Hambledon R.D.C.—The council have given notice of their intention to promote a scheme for the drainage, levelling, and improvement of Ewhurst Green.

St. Austell R.D.C.—The council have referred to the Sanitary Committee a letter received from the Local Government Board with respect to the Bugle and Stenalees drainage schemes.

St. Helens T.C.—Plans have been approved for the construction of a new sewer in Horace-street.

Southend T.C.—The tender of Messrs. Pearson, Westminster, at £160, has been accepted for the supply of a steam boiler for use as a stand-by boiler at the sewage works.

WATER, GAS, AND ELECTRICITY.

Axminster R.D.C.—Councillors for Stockland have been asked by the council to go into the question of providing a water supply for the district.

Dublin T.C.—The council on Monday last decided to increase the charges made to the local electric lighting and power

Hammersmith B.C.—The borough council have expressed approval in principle of the proposal to link up the electricity generating stations with those of Battersea and Fulham.

Ossett T.C.—It has been decided to provide new plant for tar distillation, at an estimated cost of £700.

Salford T.C.—The question of purchasing electrical plant at an estimated cost of £4,277 is under consideration.

Smethwick T.C.—The Gas Committee report that the nett profit for the year ended March 31st was £5,511, from which has been provided a contribution to public lighting and the district rate of £4,173, and one to the Free Library Committee of £50, leaving a surplus of £1,288 to be carried to the [illegible] account.

Wolverhampton T.C. The tender of the Underfeed Stoker Company, at £600, has been accepted for the supply of automatic stokers at the electricity works; also the tender of Ferranti, Limited, of London, at £438, for the supply of two sets of extra high tension switchgear for sub-stations.

MISCELLANEOUS.

Brighton T.C.—The council have agreed to make a further contribution of £493 towards the work of sea defence carried out by the East Sussex County Council for the protection of the roadway between Roedean and Rottingdean.

Hull T.C.—The question is under consideration of providing two motor ambulances for the removal of infectious cases.

Scarborough T.C.—The council have accepted with thanks an anonymous gentleman's offer to provide a motor ambulance for the general use of the borough, the local hospital to have the first call on its services, and the corporation to be responsible for its upkeep.

PERSONAL.

Mr. Sidney H. Morgan, surveyor to the Prestwich Urban District Council, has been gazetted second lieutenant in the East Lancashire Royal Engineers.

Mr. H. D. Woodcock, surveyor to the Guisborough Rural District Council, has joined the Army, and the council will at their next meeting appoint his father deputy surveyor.

Mr. J. R. Ridley, surveyor to the Stanhope Urban District Council, is, we are pleased to state, recovering satisfactorily from the injuries he received in a motor cycle accident a month ago.

Mr. Jepson, assistant in the borough surveyor's department, Kingston-on-Thames, has joined the Royal Engineers, and Mr. Bryan, a clerk in the office, is serving in France in Red Cross work.

Mr. T. Huddleston, surveyor to the Grange Urban District Council, has had his salary increased from £250 to £275 a year. Out of his salary Mr. Huddleston has to pay a clerk £40 a year.

Mr. T. A. Kingham, second assistant in the electricity department, Kingston-on-Thames, has been appointed chief assistant to the borough electrical engineer in succession to Mr. P. C. Simpson.

Mr. F. Hewitt, surveyor to the Kiveton Park Rural District Council, has applied for a commission in the Army, and the council have decided, should he be accepted, that his position be held open for him.

Mr. Burnett Bullock, Mitcham, has been appointed surveyor to the newly-constituted Mitcham, Surrey, Urban District Council at a salary of £250, rising to £300 per annum. Mr. C. G. Rabbetts, Mitcham, has been appointed sanitary inspector to the same authority at a salary of £200 a year.

Mr. M. A. Moynihan has been presented by the corporation waterworks staff with an illuminated address and a case of Irish-made pipes in honour of his appointment as deputy borough surveyor of Dublin. Mrs. Moynihan receiving on the same occasion a handsome tray and tea and coffee service.

Mr. Raymond Unwin, town planning assistant to the Local Government Board, was on Wednesday elected president of the Town Planning Institute, and Messrs. J. W. Cockrill, borough engineer of Great Yarmouth, and E. R. Abbott, clerk to the Ruislip-Northwood Urban District Council, were elected vice-presidents.

Mr. Eli Marsden has been recommended for the position of borough surveyor of Darwen rendered vacant by the death of Mr. R. W. Smith-Saville. Mr. Marsden is a native of Darwen, and was a student at the local secondary school, after leaving which he went to Owens College, Manchester. Twelve years ago he became articled to Mr. Smith Saville, and has been in the service of the corporation ever since. He has been entrusted with several important schemes, notably the Bolton water supply. Mr. Marsden is an associate member of the Institution of Civil Engineers. His commencing salary is £300.

Mr. John Robinson, surveyor to the Darlington Rural District Council, who is retiring in order to carry on his own business, was recently presented by the councillors and official staff with a silver tea service and silver-mounted tea tray. From the workmen Mr. Robinson received the gift of a gold albert and medallion. Mr. Robinson, who has served the council for nearly nineteen years, was complimented upon his "faithful and efficient service," more particularly with respect to the condition of the local

roads. In the course of his speech he said he had always tried to ascertain the most up-to-date methods, and he contended that tar slag for the roads which the council introduced would hold its own against anything brought forward. When he first took over the office the council had no steam roller, and after securing this they commenced the slag works in a small way, and introduced mechanical haulage traction engines and wagons, which had been superseded by petrol wagons, which had been more economical, and did less damage.

OBITUARY.

Lieutenant John Nixon Horsfield, A.R.I.B.A., F.S.I., whose death from wounds received in action at the Dardanelles has been reported, was a son of the late Mr. J. Nixon Horsfield, formerly surveyor to the Hampton Wick Urban District Council. He was educated at the City of London School, and was well known to rowing men, having twice represented at Henley the Kingston Rowing Club, of which he was a life member. He was only thirty-two years of age, and leaves a widow.

Mr. Robert Phillips, formerly county surveyor of Gloucestershire, died, we regret to state, at Gloucester on Sunday morning after a long illness, aged seventy-seven years. Mr. Phillips retired eight years ago but the county council retained his services as consulting surveyor. He was an associate member of the Institution of Civil Engineers, and a member of the Institution of Municipal and County Engineers, and of the Royal Sanitary Institute. He leaves one son Mr. Robert S. Phillips, architect to the County Education Committee, and three daughters, one of whom is the wife of Mr. W. J. Bache, the borough electrical engineer of Cheltenham.

CO-ORDINATION OF MILITARY AND CIVIL SANITARY SERVICES IN WAR TIME.

The above was the subject of a paper read by Mr L. S. Mackenzie, the city engineer of Bristol, at a meeting of the Royal Sanitary Institute held in that city on the 11th inst. under the chairmanship of Lieutenant-Colonel H. R. Kenwood, R.A.M.C.(T.), M.B., D.P.H. Those present included Messrs. T. H. Yabbicom (consulting engineer to the corporation), W. Harpur (Cardiff), T. H. Moss-Flower (Bristol), G. E. Ford (deputy city engineer), W. E. Laishmore and A. J. Claypole (city divisional engineers), F. Wilson and H. A. Palmer (district engineers), and H. W. Harding (chief architectural assistant to the city engineer).

Mr. Mackenzie observed that the scope of the civilian engineer and surveyor in war-time, as compared with that of the medical officer of health, would appear to be very limited. His local knowledge should, however, be of some assistance to the military authorities in the following directions: (1) Suitable sites for camps; (2) billeting accommodation; (3) water supply; (4) sanitary arrangements; and (5) reliable contractors. In the selection of camping grounds, apart from actual military necessities, the most desirable site would be gently sloping ground at a fairly high elevation, with good drainage, and covered with grass or low vegetation, as near as possible to a main road, and with an adequate supply of water.

As regards billeting accommodation, more especially in towns, the surveyor should have a pretty good idea where suitable buildings are, and thus save the military authorities much time in making inquiries. The chief requirements to be kept in view were that the buildings should be waterproof, as far as possible free from draughts, but at the same time thoroughly well ventilated, an ample supply of water, and, in the event of there being insufficient sanitary accommodation, plenty of facilities for extending this. The regulation air space per man allowed in barracks is 600 cub. ft., and the floor space 60 sq. ft., and, although in cases of emergency it might not be possible to give so much space, it is very important to avoid overcrowding. There was always a possibility of a man having acquired some infectious disease, and the closer men were billeted the greater the chance of the disease spreading. On the other hand, a bell-tent, having its full complement of fifteen men, only provides 12 sq. ft. and 32 cub. ft. per man. In large towns it would appear to be more convenient to utilise public halls, warehouses, factories, &c., but in rural districts it becomes necessary to billet the troops in private houses, and the accommodation to be obtained in this way was calculated at the rate of nine or ten per inhabitant. Special arrangements should be made for the removal of ashes and refuse at least once a day.

The water supply is a very important matter in war-time. The purity of the water was of the utmost importance. Small ponds should on no account be used for drinking water. As regards sanitation, this would probably be undertaken, in most cases, by the military authorities, but the surveyor would be able to give information as to any sewers that may be available. Lastly, he would be able to recommend the most reliable and capable building and haulage contractors in the district—information that should be very valuable to the military authorities.

Following a discussion, the chairman (reports the *[illegible]* remarked that what was really at the back of a good deal of the dissatisfaction in regard to co-operation of the civil with the military authorities was the intense desire of everyone to lend a hand. Medical officers and engineers wanted to give their services to the fullest possible extent, and they felt that that had not been the case, and perhaps the lack of recognition had led to the criticism often heard. He did not think the civil authorities did co-operate to the greatest possible extent with the military authorities. That was not the fault of the War Office, who had issued orders that the military authorities should seek the fullest possible co-operation of the civil authorities. The Local Government Board were equally keen on promoting that co-operation, and to that end had circularised the medical officers of health and appointed inspectors to specially work to this end. They found fairly good co-operation on the medical side, but extremely bad on the practical sanitation side. When engineers were consulted their advice was sometimes sought too late, in some cases after trouble had occurred which might have been avoided if their co-operation had been obtained earlier. The reason why the co-operation had not been better was capable of explanation. He did not think medical and sanitary officers quite realised that when any premises were taken over by the military they were solely responsible for the sanitary arrangements as for everything else. Army medical officers were highly trained, expert men, and under normal conditions there was no need to seek the help of the civil authorities. Owing to the war and the enormous growth of new armies, there was now reason for close co-operation with civil authorities. The Army attitude was that they would use the knowledge and services of the local authorities when they required them. He (the speaker) was of opinion that the services of local medical officers and engineers would be much utilised if they were less coy, and came forward more readily, especially where military provisions overlapped their own.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of SURVEYOR *readers with a view to making the information given under this head as complete and accurate as possible.*

INQUIRIES HELD.

Rugby R.D.C. (June 15th. Mr. A. W. Brightmore).—£1,000 for works of sewage disposal for Dunchurch.—It was stated that the money was required to purchase the site of the existing outfall works, and for the purchase of land on the Daventry road for the provision of outfall works. The surveyor, Mr. T. W. Willard, stated that at the main outfall it was proposed to convert the existing catchpits chamber into a screening chamber, and to take the screened sewage to the septic tanks. Provision had also been made for dealing with the storm overflow. He had estimated that premises in which 835 persons were located would be connected with the sewerage scheme, but he believed the actual number would be rather less than this.

Stalybridge and Dukinfield Joint Sewerage Board (June 10th. Mr. A. G. Drury).—£28,539 for sewerage and sewage disposal.—It was stated that since the inception of the scheme in 1894 the total amount of loans sanctioned was £99,892. The amount of the present application in the first place was with respect to an excessive expenditure on the 1908 sanction of £13,564—namely, £2,204. The second item was expenditure on the 1911-12 sanction, amounting to £12,018 and £791, giving a total for these two of £13,510, less £5,000 provisionally sanctioned in October of last year, leaving a balance of £8,510. There was also an application in respect of new and additional works,

amounting to £17,825, giving the total amount asked for—£28,539. This money was necessary to meet the requirements of the Mersey and Irwell Joint Committee by completing works now in progress. At the last meeting of the board a resolution was passed to the effect that, failing any further sanction by the Local Government Board, the expenditure on the extensions should cease at the earliest time possible. Mr. C. J. Lomax, engineer, explained the plans, and said he wished to impress upon the inspector that, whatever else was granted, it was necessary that they should have money for the storm-water tanks.

Wrexham T.C. (June 18th. Mr. W. O. E. Meade-King). £6,056 for the erection of working-class dwellings under Part III. of the Housing of the Working Classes Act, 1890.—It was explained that a loan of £1,660 was approved nine months ago to enable the council to buy certain land, but as the owner definitely reserved the minerals in the draft contract, without payment of compensation for surface damage caused by the working of the minerals, the negotiations fell through, the council declining to take the risk of loss by subsidence. It is now proposed to utilise a portion of surplus land belonging to the corporation, and adjoining the slaughter-houses, for the erection of thirty houses, of which sixteen will be 5s. 9d. per week, including rates, and fourteen 5s. 6d., including rates.

APPLICATIONS FOR LOANS.

Audley U.D.C. £1,300 for a sewage disposal scheme.

Epsom U.D.C.—£1,000 for a motor fire engine.

Peterborough C.C.—£1,947 for main road improvements.

Wigan T.C.—£1,200 for the purchase of transformer switchgear and cables.

LOANS SANCTIONED.

Budleigh Salterton U.D.C.—£400 for works of water supply.

East Lothian C.C. £450 for drainage works at Innerwick.

Greenwich B.C.—£1,450 for a tuberculosis dispensary.

Hanwell U.D.C.—£4,000 for an isolation hospital.

Ilkeston T.C. £7,351 for the completion of the sewerage scheme.

Mansfield T.C.—£2,000 for electricity plant.

Paignton U.D.C.—£2,527 (for thirty years) and £260 (for ten years) for the extension and furnishing of the isolation hospital.

Southampton T.C.—£1,085 for the purchase of a motor fire engine.

Tiverton T.C.—£155 for the Bolham water supply.

York T.C.—£700 for the electric undertaking.

FORTHCOMING INQUIRIES.

JUNE.	£
29.—**Bristol.** For the purposes of the electricity undertaking (Mr. A. W. Brightmore)	27,295
29.—**Luton.** For the extension of the sewage pumping plant (Mr. P. M. Crosthwaite)	2,000
JULY.	
1. —**Aldershot.** For the purposes of the electricity works (Mr. A. W. Brightmore)	8,500
1.—**Macclesfield.** For the purposes of the water undertaking (Mr. W. O. E. Meade-King)	3,300
2.—**Wednesbury.** For offices and baths extension (Mr. W. O. E. Meade-King)	1,350

FOR OTHER ADVERTISEMENTS
See End of Paper.

WANTED, Second-hand Sanitary Tumbler Cart. Replies, stating capacity, condition and price, to be sent to W. Beard, Sanitary Inspector, Harlow, Essex. (2,613)

DOORKEEPER required. Practical experience on Public Works essential. Apply, stating age, experience, and wages required, William Perrey, General Manager, Water Department, Sheffield. (2,617)

WANTED — STOREKEEPER and YARD FOREMAN to a Municipal Authority. Salary from 30s. to 40s. per week, including house, fuel, and gas, valued at 7s. per week. Applications, stating age and experience, with not more than three recent testimonials, to be sent not later than Monday, 5th July, to Box 1,528, office of The Surveyor, 24 Bride-lane, Fleet-street, E.C. (2,616)

FRIERN BARNET URBAN DISTRICT COUNCIL.

ENGINEER AND SURVEYOR'S DEPARTMENT.

Required, a Temporary Assistant (during the War). Must be good practical Surveyor, Leveller and Draughtsman. Preference will be given to one with a municipal experience, but applicants must not be eligible for military service.

Further particulars and application forms can be obtained from the undersigned.

(By order of the Council)
E. J. REYNOLDS, A.M.I.C.E.,
Engineer and Surveyor.

Council Offices,
The Priory,
Friern Barnet, N.
June 23, 1915. (2,611)

THE MALDENS AND COOMBE URBAN DISTRICT COUNCIL.

Wanted, Temporary General Assistant, Surveyor's Department. Qualifications: Typewriting and book-keeping, and the surveying of drainage and building works in progress is essential. A knowledge of short-hand, surveying and levelling is desirable. Preference will be given to a candidate who has had previous experience in a similar office. Candidates must not be eligible for service in H.M. Forces.

Salary £2 10s. weekly, payable monthly.

Applications, in candidate's handwriting, stating age and experience, with copies of three recent testimonials, and endorsed "General Assistant," to be delivered to the Clerk of the Council not later than noon on Friday, 2nd July, 1915. Canvassing will disqualify.

Council Offices,
New Malden, Surrey.
June 22, 1915. (2,612)

TILBURY URBAN DISTRICT COUNCIL.

The above Council invite Tenders for the following

Broken Granite.
Granite Chippings.
Best Welsh Steam Coal.
Gas Coke.

Forms of Tender, &c., may be obtained from Mr. S. A. Hill-Willis, Assoc.M.Inst.C.E.I., Engineer and Surveyor to the Council, on and after Friday, the 25th June, 1915, on the production of a receipt from the Council's Accountant for a deposit of £2, which will be refunded on the receipt of a *bonâ-fide* Tender.

Sealed Tenders, on the Form and in the envelope provided, addressed to the undersigned, are to be delivered not later than the first post on Saturday, the 3rd July, 1915.

The Council does not bind itself to accept the lowest or any Tender.

(By order)
THO. A. CAPRON,
Clerk to the Council.

Council Offices,
Dock-road,
Tilbury.
June 23, 1915. (2,614)

COUNTY BOROUGH OF WIGAN.

The Corporation of Wigan invite Tenders for the completion of Greenhouses at the Mesnes Park, Wigan.

Specification, Bill of Quantities and Form of Tender may be obtained from Mr. A. T. Gooseman, Borough Engineer, King-street West, Wigan, on payment of a fee of £2 2s., which fee will be returned on receipt of a *bonâ-fide* Tender.

Sealed Tenders, endorsed "Greenhouses," to be delivered to me not later than noon on Wednesday, the 7th July, 1915.

The Corporation do not bind themselves to accept the lowest or any Tender.

WM. HENRY TYRER,
Town Clerk.

Town Clerk's Office,
Wigan.
June 23, 1915. (2,615)

The Effect of Springs Upon Water Levels in the Chalk of Eastern Surrey.*

By HENRY DEWEY, B.Sc.

The present paper deals with an area of some 30 square miles situated in North-East Surrey, between Epsom and Croydon. Most of this country consists of chalk, but a narrow strip along the northern edge is formed by the sands, loams and clays of the tertiary beds; and some plateaus and isolated hills on the east are capped with thick masses of pebbles.

The area is separated into two districts by a deep narrow valley, in which the town of Croydon has in great part been built. On the west the ground is gently undulating with a general northerly slope, the fields being wide, bare and exposed, contrasting in this respect with the deep sheltered dales and wooded hills lying to the east of the main valley. This change is abrupt and conspicuous, and when its cause is sought the importance of the beds of pebbles mentioned previously is realised. A short account of the geology of the whole area is necessary for a proper understanding of the movements of the subterranean waters and their escape as springs.

GEOLOGY.

The oldest rocks met with are the several varieties of chalk which lie one upon another in thick-bedded masses. Each of these several masses contains an assemblage of fossils which is more or less restricted to it.† The chalk is thus divisible into a series of layers which have been described as life-zones, and the several zones are known by the names of significant or characteristic fossils. Various species of sea-urchins have been chosen to indicate these zones, three names being *Micraster glyphus*, *Micraster cortestudinarium*, *Micraster coranguinum*, and *Marsupites testudinarius*. The economic importance of the recognition of these fossils lies chiefly in the ready determination of the position in the chalk of a particular bed or core—*e.g.*, a core from a borehole could be ascribed to its proper position above the base of the chalk if it contained any of these characteristic fossils. The importance of this is obvious when advice is to be given as to the continuation of a borehole for water supply.

Overlying the chalk are the tertiary beds. The lowest of these is a bed of fine, light yellow sand of varying thickness, but increasing from west to east up to 60 ft. This is overlain in turn by the Woolwich and Reading beds, consisting of some 40 ft. of green sands, mottled red and green clays, and variously coloured loams. The beds which lie upon the mottled clays to the west of Croydon are homogeneous blue clays, known as London clay; but east of Croydon a thick mass of pebbles with sand lies between the Woolwich and Reading beds and the London clay. The abrupt change of topography and scenery is due to the oncoming of these pebble beds. They are permeable to rain and form an arid and poor soil, suited to the growth of pine trees and heath, and the well-known commons at Shirley, Hayes and West Wickham are due to these beds. Their economic importance will be discussed later when their effect upon structure and water movement in the chalk is considered.

WATER LEVELS IN THE WELLS OF THE DISTRICT.

If the range of fluctuation of the water levels be considered, a very remarkable difference is seen to exist between the groups of wells situated respectively east and west of the Croydon Valley.

The range of fluctuation of the water level remains constant in the wells both of the western and eastern districts, but the two groups differ widely from one another, there being nearly four times as great a range in the wells on the east as there is in those on the west; the figures being 4¼ and 14 ft. on the west and 16 and 55 ft. on the east.

The causes of this difference must next be considered. First, the supply of water is, in both cases, the rainfall. This is indicated on the rainfall map of Surrey,‡ which shows that the isohyetal lines run nearly due east and west between Epsom and Coulsdon, but east of the Croydon Valley turn a little north, while a small area of higher rainfall is shown around Warlingham. There are no published data relating to the percolation of rain over the same area, but it is probably greater between Epsom and Croydon, owing to the bareness of the chalk, than it is east of that locality, where wide spreads of tertiary beds and clay with flints form the surface. The impermeability of these beds would tend to increase evaporation and decrease percolation, and so equalise the amount of water entering the chalk of the two areas. The difference of fluctuation must therefore be due to the escape of water which has already penetrated the chalk. Pumping may cause some of the difference, but in Lucas's time there were not many pumps working, and the difference was then even more pronounced than now. There is, however, a very obvious source of exhaustion in the many powerful springs which gush out from beneath the tertiary beds at Ewell, Carshalton, and Waddon. These emit annually many millions of gallons of water, and the continual drain on the underground resources must tend to lower the water level permanently. The actual quantity escaping in recent years from these springs has not been gauged, or if it has, the results are unpublished, so that Lucas's figures must be resorted to in calculating the effect upon the water levels. According to Lucas the amount of water which gains access to the chalk of the drainage area feeding these springs is 89,229,388,800 gallons annually, equal to a daily average of 244,464,078 gallons, while the amount flowing away at the springs is 39,156,680 gallons,* or, in other words, as much as 16 per cent escapes annually. On the east of the Croydon Valley there are none of these powerful springs, and all the water that percolates into the chalk flows down beneath the tertiary beds and tends to raise the water level over the whole catchment area.

The question of the cause of the springs is an obscure geological problem, but some significant facts may be mentioned. First among these is the faulted nature of the chalk near the outcrop of the tertiary beds between Epsom and Croydon. Almost everywhere in this district when artificial sections are cut in the chalk small slips and faults are exposed upon which water accumulates as drops, or sweats out from the rock. Similar faults are seen east of Croydon, but not nearly so frequently. The chalk, however, is jointed, and it is along these joints that the underground waters flow rather than through the rock mass itself.

Another feature of the western district is the presence of a series of shallow folds or undulations which lie on the main dip-slope. These increase in amplitude from Epsom to Sutton, where the dip is 10 deg., and decrease thence eastwards to Croydon, where it is only 1 deg. The dip of the main mass of the chalk is gently towards the north, but just beyond the outcrop of the tertiary beds it suddenly increases for a short distance and then flattens out into a gentle slope, thus forming a sort of step. This structure also ceases east of Croydon. All these structures are due to movements of the earth's crust, which resulted in the tilting and folding of the beds while accommodating themselves to the smaller space they had to occupy on account of contraction, and the beds which suffered most deformity were those which are now exposed on the west side of the main valley. It is significant that with the oncoming of the massive pebble beds on the eastern side of the Croydon valley, the deformity and faulting of the chalk diminishes in amount and the emission of springs ceases. There can therefore hardly be a doubt that the phenomena are correlated, even if the absence of springs is not consequent upon the presence of the pebble beds.

In conclusion, then, the chief points of the paper may be summarised in the following words:—

Two contiguous areas differ markedly from each other in the movements of their subterranean waters. This difference is caused by the emission of springs in one area and their absence in the other, which in

* Paper read at the Summer Meeting of the Institution of Water Engineers on Friday last.

† Mr. G. W. Young was the first observer systematically to investigate the zonal characters of the chalk of this neighbourhood (see "Proceedings Geologists' Association," vol. xix., pp. 188-219), since when Messrs. Hinde, Gossling, Wright and Polkinghorne have added to our knowledge of the subject.

‡ Water Supply of Surrey. "Memorandum Geological Survey, 1912."

* Lucas, "Horizontal Wells," p. 12, 1874.

turn i. due to differential effects of folding and faulting of the rocks of the two districts and by the presence of massive beds of pebbles on the east and their absence on the west. The rise and fall of the underground water in the eastern is about four times as great as that in the western district; while the amount of water escaping at the springs is equivalent to one-sixth of that which percolates into the chalk over the catchment area. From these figures it may be inferred that the underground waters follow defined channels rather than flow through the interstices of the mass of the chalk.

ASSOCIATION OF MANAGERS OF SEWAGE DISPOSAL WORKS.

ANNUAL SUMMER CONFERENCE.

The annual summer conference of the Association of Managers of Sewage Disposal Works will be held at Leeds on Saturday, July 10th, at 10.30 a.m.

Dr. H. Maclean Wilson, M.D., B.SC., will deliver his presidential address.

Mr. Geo. A. Hart, M.INST.C.E., will give an explanation of the works included in the main drainage and sewage disposal scheme—illustrated by cartoons.

Mr. John T. Thompson, M.SC., will read a paper, "Seven Years' Experience with a Large Sludge Pressing Plant"; discussion.

Visit to the Leeds sewage disposal works.

VISIT TO WEALDSTONE.

A visit to the works of the Wealdstone Urban District Council's sewage disposal works has been arranged for to-morrow (Saturday) at 3 p.m.

These works should prove of particular interest to visitors, fifteen of the filter-beds which have been completed being in successful operation, and four can be inspected in various stages of construction.

PROGRAMME.

3 p.m.—Visitors meet at L. & N.W. Railway station.

3.15 p.m.—Walk to sewage disposal works (fifteen minutes).

Reception by chairman of the council, Mr. J. H. Searcy, J.P., and chairman of the Sanitary Committee, Councillor F. W. Wale.

Description of the works by the engineer to the council.

5 p.m.—Visitors will be entertained to tea in pavilion, recreation ground.

J. B. CROLL,
Secretary

ROYAL SANITARY INSTITUTE.

YEOVIL MEETING.

At Yeovil, on July 14th, a discussion on "Water Supplies to Rural and Small Urban Areas" will be opened by Dr. W. G. Savage, county medical officer of health of Somerset.

APPOINTMENTS VACANT.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* WEDNESDAYS *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

TEMPORARY ASSISTANTS.—June 28th.—Corporation of Chesterfield. £80 a year.—Mr. H. A. Bridge, acting borough surveyor.

SANITARY INSPECTOR.—June 28th.—Lewisham Borough Council. £150 a year.—Town Clerk, Town Hall, Catford, S.E.

TEMPORARY ASSISTANT.—June 29th.—Heston and Isleworth Urban District Council. £3 3s. per week.—Mr. J. G. Carey, engineer and surveyor, Council House, Hounslow.

SANITARY INSPECTOR.—June 30th.—Clare (Suffolk) Rural District Council. £130 per annum.—Mr. S. L. Bigmore, clerk, 2 Wratling-road, Haverhill.

TEMPORARY SURVEYING ASSISTANT.—July 1st.—Gelligaer Urban District Council. £120 a year.—Mr. Frank T. James, clerk, Hengoed, Glam.

INSPECTOR OF NUISANCES. July 2nd. Buxton Urban District Council. £120 per annum.—Mr. J. Taylor, clerk, Town Hall.

SURVEYOR AND SANITARY INSPECTOR.—July 10th.—Brumby and Frodingham Urban District Council.—Mr. G. S. Sowter, solicitor and clerk, Brigg, Lincs.

DRAUGHTSMAN.—Survey Department of the East India Protectorate. £160—£205 a year.—Crown Agents for the Colonies, Whitehall-gardens, London, S.W.

MUNICIPAL CONTRACTS OPEN.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* WEDNESDAYS *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

Buildings.

LEYTON.—June 29th.—For cleaning, painting and repairing various schools, for the Education Committee.—Mr. W. Jacques, 2 Fen-court, Fenchurch-street, E.C.

CONWAY.—June 29th—July 5th.—For the construction of steel girder bridge and approaches, and laying mains, for the Colwyn Bay Joint Water Supply Board.—Mr. C. F. Farrington, engineer, Trinity-square, Llandudno.

MIDDLESBROUGH.—June 29th.—For reconstruction work at public baths, for the Sanitary Committee.—Mr. S. E. Burgess, borough engineer.

ALDERSHOT.—June 29th.—For the erection of a brick-built block at the isolation hospital, for the urban district council.—Mr. F. C. Uren, surveyor.

BRADFORD.—June 29th.—For the erection of a school and other works, for the corporation.—City Architect, Town Hall.

HOMERTON.—June 30th.—For repairs and cleaning at hospital, for the Metropolitan Asylums Board.—Mr. W. T. Hatch, engineer, The Embankment, E.C.

LONDON.—June 30th.—For repairs and cleaning works at Homerton Asylum, for the Metropolitan Asylums Board.—Board Offices, Embankment, E.C.

BOOTLE.—June 30th.—For alterations to offices and sheds at the town hall yard, for the corporation.—Borough Engineer.

GODALMING.—June 30th.—For the erection of a sanatorium, for the Metropolitan Asylums Board.

MANCHESTER.—June 30th.—For the erection of piggeries, for the Sanitary Committee.—City Architect, Town Hall.

BARNSLEY.—June 30th.—For renovations at schools, for the Education Committee.—Mr. E. W. Dyson, architect.

MANCHESTER.—July 1st.—For the erection of an engine-house, for the Gas Committee.—Mr. F. A. Price, superintendent, Gas Department, Town Hall.

WEST RIDING.—July 3rd.—For repairs to schools, for the Education Committee.—Mr. A. Angus, West Riding Education Offices, Wakefield.

KENT.—July 5th.—For repairs to schools, for the Education Committee.—Mr. W. H. Robinson, architect, Sessions House, Maidstone.

ELY.—July 5th.—For the building of an isolation hospital, for the urban and rural district council.—Mr. S. J. Wearing, architect, 15 Upper King-street, Norwich.

[illegible]—For the erection of a shelter and conveniences, for the urban district council.—Mr. J. H. Castle, engineer and surveyor.

BEDS.—July 7th.—For renovation works at various schools, for the Education Committee.—Mr. R. K. Ellison, Shire Hall, Bedford.

WRENHAM.—July 8th.—For redecorating and painting certain buildings, for the corporation.—Mr. J. England, borough engineer, Willow-road.

Gas and Electricity.

BIRKENHEAD.—June 30th.—For the supply of a gas condenser and gas washer, for the corporation.—Gas Engineer, Gasworks, Thomas-street.

Engineering Iron and Steel.

BATTERSEA.—June 30th.—For the supply of iron castings, for the borough council.—Borough Engineer.

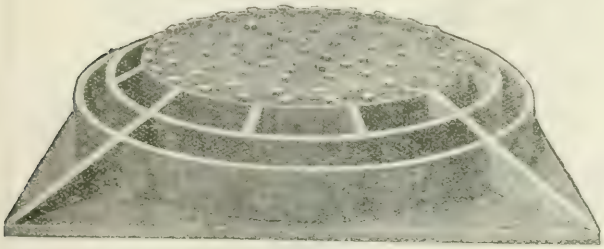
THE "GRIP" PATENT MANHOLE COVER.

Rounded edges avoided. A depth of 5in. of macadam gripped around the outer frame of the cover by the concentric rings shown.



SEWERAGE IRONWORK.

AS will be seen from the photograph, the concentric rings which form an integral part of the frame provide annular spaces in which the road material is not only held up, but becomes more and more consolidated in these spaces as it is compressed by the traffic. This has the effect of reducing the crumbling of the road material, and its wearing away from the vertical edge of the frame.

But road material will wear away eventually, and when it does the "GRIP" cover provides against the danger of abrupt edges. The concentric rings are graded in height, and if the road above them becomes worn they provide an inclined plane to the edge of the frame. It will be seen that we have avoided rounded edges, because with a curved edge the road material becomes so thin at its point of contact with the iron that it can only last for a very short time, and when it has worn a depression is left between the road surface and the iron, which is dangerous.

AUTOMATIC SYPHONS, DISC VALVES, FLAP VALVES, VENT COLUMNS, PENSTOCKS.

HALIFAX.—July 1st.—For the supply of electricity plant, for the Electricity Committee.—Mr. W. M. Rogerson, borough electrical engineer.

LLANDILOFAWR.—July 2nd.—For the construction of water supply works, for the rural district council.—Mr. E. Jones, surveyor, Glancennen, Llandebie.

ERITH.—July 5th—19th.—For the supply of electricity plant, for the urban district council.—Engineer and Manager, Electricity Works, Walnut Tree-road, Erith.

DUNDALK.—July 5th.—For sinking a well and erecting a pump, for the rural district council.—Mr. Cahil, Council Offices.

WITHERNSEA.—July 6th.—For the supply and laying of water mains, for the urban district council.—Mr. J. B. Kirton, engineer, Council Offices.

MADRAS.—July 14th.—For the supply of cast-iron pipes, special castings, sluice valves and hydrants, for the corporation.—Mr. J. W. Madeley, special engineer; agents, Messrs. James Mansergh & Sons, 5 Victoria-street, Westminster, London, S.W.

RANGOON.—August 11th.—For the installation of a system of fire alarms, for the municipality.—Messrs. Ogilvy, Gillanders & Co., 67 Cornhill, London, E.C.

Roads.

BROWNHILLS.—June 28th.—For tar-spraying 35,000 super. yds. of road and tar grouting, for the urban district council.—Mr. J. H. Shaw, engineer and surveyor.

CHORLEY.—June 28th.—For works of widening and improvement, for the rural district council.—Mr. P. Whalley, highway surveyor.

SKELTON.—June 30th.—For making up back streets, for the urban district council.—Mr. A. R. Cranmer, surveyor, High-street, Skelton-in-Cleveland.

BASINGSTOKE.—June 30th.—For steam rolling, for the rural district council.—Mr. R. Forrester, surveyor, Chequers-road.

MANCHESTER.—July 1st.—For repaving at Campfield market, for the Markets Committee.—Mr. Thomas Hudson, town clerk.

HARROW.—July 3rd.—For the supply of broken granite, gravel, tarred granite or slag, and tarred granite or slag chippings, for the urban district council.—Mr. J. P. Bennetts, surveyor.

SHEFFIELD.—July 3rd.—For laying about 1,900 yards of creosoted wood paving, the price to include seven years' free maintenance, for the corporation.—Mr. W. J. Hadfield, city surveyor, Town Hall.

HUYTON.—July 3rd.—For paving work with granite setts, for the urban district council.—The Surveyor.

WELLINGBOROUGH.—July 3rd.—For the supply of granite, granite treated with Bi-tarco, limestone, limestone chippings, and patent paving slabs, for the urban district council.—Mr. J. T. Parker, clerk, 29 Church-street, Wellingborough.

COTTINGHAM.—July 5th.—For the supply of broken whinstone, granite, and screened chippings, for the urban district council.—Mr. J. H. Hanson, surveyor.

COALVILLE.—July 5th.—For making up and sewering part of a street, for the urban district council.—Mr. L. L. Baldwin, surveyor.

HALE.—July 7th.—For making up back passages, for the urban district council.—Mr. T. Blagburn, surveyor.

PONTEFRACT.—July 7th.—For team labour and the erection of creosoted wood fencing, for the rural district council.—Mr. J. P. Senior, surveyor.

BEDS.—July 7th.—For work of tar-painting and repairing, for the Education Committee.—Mr. R. K. Ellison, surveyor, Shire Hall, Bedford.

HASTINGS.—July 9th.—For steam rolling work, for the rural district council.—Mr. J. Standen, district surveyor, Ivy House-lane, Ore, Hastings.

LEES.—July 10th.—For asphalting a footpath, for the urban district council.—The Surveyor, Council Offices, Cross-street, Lees, Lancs.

Sanitary.

BROWNHILLS.—June 28th.—For laying 9-in. stoneware pipe sewer, for the urban district council.—Mr. J. H. Shaw, engineer and surveyor.
